Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Caesarean section, Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received from a registered nurse certificated concerning a 22 year old female patient with no significant past medical history and no concurrent medical conditions who on 19-SEP-2008 was vaccinated with the first dose of GARDASIL (Lot # 660620/0571X). No concomitant medication was reported. On 19-NOV-2008 was vaccinated with the second dose of GARDASIL (Lot # 661044/0548X). On 20-JAN-2009, an ultrasound was performed for dating which showed single live intrauterine pregnancy (SLIUP), 12 weeks, 2 days. (LMP 31-OCT-2008, EDD 07-JUL-2009). A MSAFP was declined by the patient. Follow up information was received from a registered nurse certified. She reported that on 08-AUG-2009, at 40 1/7 weeks from LMP, the patient gave birth to a normal male infant with no congenital anomalies weighing 8 pounds and 0 ounces, apgar score 9/9. It was reported that the patient required a c-section for fetal bradycardia due to cord compression (cord pH 7.257). There were no other complications during pregnancy neither infections nor illnesses. Laboratory testing during pregnancy included routine screening (results not provided). Upon internal review c-section, fetal bradycardia and cord compression were determined to be other important medical events. Additional information has been requested.

Other Meds: None

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Condition aggravated, Neurodermatitis, Vaccine positive rechallenge

Symptom Text: Case received from a health care professional on 30-JUN-2009. This case was poorly documented. It was reported by a gynecologist that an adult female patient with medical history of neurodermatitis was vaccinated with a third dose of GARDASIL (lot #, injection site and route not reported) on an unspecified date. Subsequently, on unknown date, she experienced aggravation of neurodermatitis. She recovered within approximately three weeks. After first dose and second dose vaccination with GARDASIL the patient experienced aggravation of neurodermatitis too, from which she recovered each time within approximately within three weeks. Follow-up information received on 31-AUG-2009. The reporting form was sent. The patient is 20 years old. Upon additional information (hospitalization) the case was upgraded to serious. In contrast to what was reported initially by phone, aggravation of the neurodermatitis was observed for the first time in February 2008, i.e. shortly after the second dose of GARDASIL (dose 1 on 27-NOV-2007, batch number was NF58550, lot number was 0276U, dose 2 on 28-JAN-2008, batch number was NG00020, lot number was 0277U, given in the upper arm, route not reported). The first dose was well tolerated. Despite ongoing symptoms, the patient received her third dose of GARDASIL (batch number was NH13130, lot number was 1172U) on 07-AUG-2008. In summer/autumn in 2008 the aggravation reached its peak. In September 2008 the patient was hospitalized in a specialized clinic for an unspecified duration. She was treated with cortisone (meanwhile discontinued) and Elidel. The patient has still treatment with acupuncture. Although the reporter crossed the box "recovered" on the reporting form, he mentioned in writing that the symptoms were still ongoing. The case is closed. Other business partner numbers include E2009-0542. No further information is available.

MedDRA PT Asthenia, Blood test, Headache, Vertigo, Vomiting

Symptom Text: Information has been received from a Health Authority (ref # 101634) concerning an 11 year old female patient who on 13-JUL-2009 was vaccinated with the first dose GARDASIL (batch # NJ36070, LOT # 0779X; 0.5 mL, IM, site of administration not reported). Ten minutes after vaccination, the patient presented with asthenia, headache and vomiting. At 30 minutes after events the recovery was not sufficient, the patient was sent to emergency for complementary observation. Continued monitoring of vital sings was performed. Follow up information has been received on 01-SEP-2009. Ten minutes after vaccination, the patient with negative medical history for current chronic diseases presented with one episode of food vomiting with onset of asthenia and intense headache. She was held and monitored for 30 minutes and then sent to the ER because of persistence of the asthenia and onset of vertigo (no coded by HA). She was admitted to the pediatric ward and discharged on 14-JUL-2009 because her general condition had improved. ON 25-AUG-2009 the reporter contacted the patient's mother who confirmed that the child was in good health. The family pediatrician prescribed blood work for anti-EBV antibodies (results not available). The outcome was recovered. At the time of the report, the outcome was not reported. Other business partner numbers include: E200906789. The case is closed. No further information is available.

MedDRA PT Grand mal convulsion, Reaction to previous exposure to any vaccine

Symptom Text: This case is linked with cases E2009-08226 and E2009-08227. These cases refer to the adverse events occurred after vaccination with first and second doses of GARDASIL. Initial information was received on 25-AUG-2009 from a Health Authority (ES-AGEMED-419915344) concerning an 18 year old female who on 02-JUL-2009 was vaccinated intramuscularly with third 0.5mL dose of GARDASIL (Lot number, batch number and site of administration not reported). It was reported that on 03-JUL-2009, the patient had a tonic-clonic convulsion. Hospital admission (hospital admission and discharge dates have not been reported) and treatment with KEPPRA (dose not reported) were required. The patient recovered on 04-JUL-2009 with sequelae. It was reported that the patient received the first dose of GARDASIL (lot number, batch number and site of administration not reported) by intramuscular route and 48 hours after vaccination, the patient presented with nocturnal disorientation, nausea, concentration difficulty and amnesia. It was reported that the patient was alone in her room at the time, everything was messy. The patient presented neither incontinence nor biting of tongue. The patient received the second dose of GARDASIL (lot number, batch number and site of administration not reported) on 08-JAN-2009. It was reported that the patient presented with a clinical picture of involuntary muscle contractions, predominantly of the face, compatible with myoclonus. Other business partner numbers included: E2009-08225. No further information is available. The case is closed.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Blindness, Diplegia, Dizziness, Headache, Mental disorder, Migraine, Paraesthesia, Paralysis, Tremor, Visual impairment

Symptom Text: Information has been received from a physician concerning a 17 year old female who was vaccinated with a dose of GARDASIL. Two years ago, the patient experienced headaches, paralysis, tremors which prevented her from participating in gymnastics. Therapy with GARDASIL was discontinued. The patient sought unspecified medical attention. At the time of this report the patient had not recovered. The reporting physician considered headaches, paralysis, and tremors to be disabling. Follow up information received on 02-SEP-2009 from a physician indicated that the patient had received only 2 doses of GARDASIL. The third dose of GARDASIL was being held because of the possible link between GARDASIL and the events. The physician also indicated that the patient had been referred to a neurologist. Additional Information was also received from the medical assistant of the patient's primary physician; the medical assistant stated that the patient did not had any medical history or known drugs allergies; the patient received a first dose of GARDASIL (lot # 655618/0186U) on 23-FEB-2007. No other vaccines received on this date. At an office visit on 01-JUN-2007 the patient complained of dizziness and tremors in right hand and right foot. The patient was referred to a neurologist. The patient received a second dose of GARDASIL (lot # 659655/1486U) on 06-MAR-2009. Concomitant vaccination given on 06-MAR-2009 included a dose of DTaP (lot# C2775AA) and a dose of MENACTRA (lot # U2549AA), sites of vaccination not recorded. The patient was not seen since 06-MAR-2008. Additional information has been requested. 12/29/09 Neurological consult received for DOS 06/17/07. Pt c/o nonspecific visual problems and loss of complete vision. Pt was seen by ophthalmologist and diagnosed with migraine. Pt c/o bitemporal headache, tremors in legs, feeling of "pins and needles" in legs, feeling of paralysis, however Pt able to move legs. Neuro exam: wnl. Physician opinion was that Pt's symptoms were likely a psychological/emotional process. Pt r/o Lym

Symptom Text: Information has been received from a health professional concerning a 28 year old female who on 28-AUG-2007 was vaccinated with the first dose of GARDASIL (lot# 658558/1061U) into her left buttocks. Not long after first dose, migraine headache started. On 25-OCT-2007, the patient was vaccinated with the second dose of GARDASIL (lot# 654539/0742U) into her left gluteus and on 25-FEB-2008, was vaccinated with the third dose of GARDASIL (lot# 655327/1287U) into her left gluteus. Concomitant therapy included ALESSE. On 01-MAY-2009, the patient passed out and was hospitalized, a spinal tap was performed. The patient had migraine headache started not long after the first injection. The patient was seeing a neurologist. A MRI performed showed abnormal results. The patient developed demyelination in brain. Questionable Lupus. Upon internal review, questionable lupus was determined to be an other important medical event. Additional information has been requested. 9/16/09 Received vaccine & GYN medical records. Records reveal patient experienced wt loss & fatigue. On 5/1 had seizure, hospitalized & neuro eval done. 10/6/09 Neurological consult received service dates 5/1/09 to 5/21/09. Assessment: Migraine Presented with c/o severe bifrontal headache and episode of syncope. Transient loss of consciousness. Episodes of weakness associated with headaches, visual disturbance, migraine headaches for past year associated with use of oral contraceptives. ```ED, hospital records received 12/16/09. Service dates 5/1/09 to 5/4/09. Assessment: Hospital DX: possible MS, migraine HA, HTN, B12 deficiency, migraines w/OCP. ER dx: Syncope, EKG changes, possible MS exacerbation. Patient c/o headache and dizziness. Nausea, migraine, blurred vision, decreased vision at night. Numbness, tingling, in fingers.

MedDRA PT Anaemia, Anaemia haemolytic autoimmune, Arthralgia, Blood product transfusion, Cough, Evans syndrome, Fatigue, Idiopathic thrombocytopenic purpura, Iron deficiency, Joint swelling, Malaise, Microcytic anaemia, Night sweats, Oropharyngeal pain, Pyrexia, Thrombocytopenia

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 15 year old female with anaemia, menstruation irregular with heavy flow and a history of treating with growth hormone from age 10-13 on 17-MAR-2008 was vaccinated with the third dose of GARDASIL IM (therapy dose, site unknown) (Lot# 660387/1967U). Concomitant therapy included the second dose of HAVRIX (therapy dose, route and site unknown) (Lot# AHAVB1244) and oral hormonal contraceptives (unspecified). On 31-OCT-2008 the patient experienced anaemia, anaemia haemolytic autoimmune, arthralgia, blood product transfusion, cough, EVANS syndrome, fatigue, haemoglobin decreased, idiopathic thrombocytopenic purpura, iron deficiency, joint swelling, malaise, microcytic anaemia, oropharyngeal pain, platelet count decreased, pyrexia and thrombocytopenia and was hospitalized. These events were considered to be immediately life-threatening. Coombs test was positive (warm Ab) and haemoglobin=6, platelet=20,000. All tests were negative and comprehensive including bone marrow aspirate and BM biopsy, ANA, reticulocyte count, LDH (Lactate dehydrogenase), complements, chest x ray, serologies for Parvo, CMV, HIV, MONO, iron studies and chromosome analysis. Cause was still unknown. The patient was treated with transfusions, IVIG (intravenous immune globulin), steroids and "wait and see" approach. Ultimately the patient was given RITUXAN. The patient was recently on "remission". On 29-SEP-2009 medical records and diagnoses summary received from date of service 01-NOV-2008 to 07-NOV-2008. The diagnosis was EVANS Syndrome, presented with malaise for one month, fatigue, fever, sore throat, joint pain/swelling, cough, night sweats, anemia, thrombocytopenia, Insidious onset of symptomatic microcytic hypochromic hyperproliferative anemia with evidence of iron deficiency. The treatment was IVIG. The original reporting source was not provided. The VAERS ID # is 356835. A standard lot check investigation was p

MedDRA PT Abasia, Acute disseminated encephalomyelitis, Asthenia, Autonomic nervous system imbalance, Chills, Clonus, Convulsion, Coordination abnormal, Dyskinesia, Fatigue, Headache, Hemicephalalgia, Hyperreflexia, Lethargy, Mental status changes, Pyrexia, Tachycardia

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 17 year old female with PANMIST DM allergy and with no known medical history was vaccinated with a first dose of GARDASIL vaccine (lot# 661766/0652X) in the right arm (route not reported) on 27-May-2009. Concomitant vaccinations included a first dose of ADACEL (lot# reported as C3068AA) and a first dose of MENACTRA (lot# reported as U2869AA). On 04-Jun-2009, the patient experienced acute disseminated encephalomyelitis, abasia, asthenia, autonomic nervous system imbalance, clonus, convulsion, coordination abnormal, fatigue, headache, hyperreflexia, lethargy, mental status changes, pyrexia, tachycardia, body temperature increased and chills. Seven days after immunization, the patient started mental status changes with fever (104), headache, lethargy, inability to walk, discoordination, signs of autonomic instability. The patient went to emergency room. Two events of brief seizure with mouth pulling to the left separated by 30 minutes occurring on one day about 1 mouth following onset of symptoms. Fatigue, intermittent tachycardia, left-sided headache and general weakness have persisted, although improved over the past 3 months. She was diffuse, symmetric hyperreflexia in all extremities with 1 beat clonus of the right ankle. Diagnosis of ADEM was made. No treatment was given. The listing indicated that one or more of the events required hospitalization (05-JUN-2009 and 13-JUL-2009) and was considered to be immediately life-threatening. The originally reporting source was not provided. The VAERS ID# is 356939. No further information is available. A standard lot check investigation has been finalized. All in-process quality checks for the lot number in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the Center and was released.

MedDRA PT Abdominal distension, Abdominal pain lower, Abdominal pain upper, Alopecia, Anxiety, Bowel movement irregularity, Candidiasis, Cervical dysplasia, Colitis, Constipation, Cystitis, Depression, Diarrhoea, Disturbance in attention, Dizziness, Dyspepsia, Dysplastic naevus syndrome, Dysuria, Fatigue, Feeling abnormal, Fungal infection, Gastric disorder, Gastrooesophageal reflux disease, Headache, Irritable bowel syndrome, Joint injury, Melanocytic naevus, Memory impairment, Menstruation irregular, Micturition urgency, Mucous stools, Myalgia, Oropharyngeal pain, Pelvic pain, Pollakiuria, Premenstrual syndrome, Sinusitis, Tenderness, Urinary tract infection, Visual impairment

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. An 18 year old female with metrorrhagia and a history of septal rhinoplasty with tonsillectomy was vaccinated with a second dose of GARDASIL (lot# 653978/0955F) IM in the left arm on 10-OCT-2006. Concomitant therapy included ORTHO TRI-CYCLEN. Symptoms began with hair loss two months after first shot, from 01-DEC-2006, progressed to stomach problems, indigestion, bloating, menstrual irregularities. PMS symptoms very bad, yeast infection, bladder infection, extreme fatigue, extreme headaches, muscle aches, foggy vision, foggy memory, inability to concentrate, depression, anxiety. She was treated for systemic candidias. PCP medical records received assessment: cystitis, irritable bowel syndrome alternating type and GERD. Patient presented with urinary urgency, dysuria and frequency, hypogastric tenderness, nevus on shoulder, dysplastic nevus, multiple benign nevi, sinus infection, stomach ache, constipation, feeling run down, sore throat, UTI, diarrhea, ankle injury, bloating, dizziness, "spacy", hair loss, mucous in stool, pelvic pain, LGSIL, abnormal bowel movement pattern and inflammation of colon. The listing indicated that one or more of the events was considered to be immediately life-threatening. The originally reporting source was not provided. The VAERS ID# is 356950. No further information is available. A standard lot check investigation has been finalized. All in-process quality checks for the lot number in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the Agency and was released.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abdominal pain, Guillain-Barre syndrome, Hyporeflexia, Muscle contracture, Muscle spasms, Muscular weakness, Nausea, No reaction on previous exposure to drug, Paraesthesia, Pelvic pain

Symptom Text: Case received from a physician on 04-SEP-2009: A 17 year old female patient had received the second dose of GARDASIL (Lot number not reported) in her left arm, on 31-AUG-2009. The following day after vaccination i.e. on 01-SEP-2009, the patient experienced on both arms, especially on right arm, paresthesia with the sensation of muscle cramps, decreasing of muscular strength: the patient noticed a latent period to perform an action with her arm. Nothing was observed at the site of injection. The following days, the patient experienced lumbar contractures, nausea and abdominal pain, but pelvic; the patient was in the middle of her menstrual cycle and was under contraception. These events were predominantly nocturnal. Consultations on 07-SEP-2009 found diffuse paresthesia of right arm, significant decreased of right osteotendinous reflexes. It was specified that at the beginning of the symptoms, the patient experienced paresthesia at right foot which quickly resolved. Corrective treatment with paracetamol, VOGALENE, Phloroglucinol Hydrate; SPASFON were given. Neurology consultation was planned at the time of the report (in the afternoon), for a suspect Guillain-Barre syndrome but the time to onset seemed very short. To be noted that the patient had not experienced fever or infectious signs recently, and that she was taken oral contraception. On 03-JUN-2009, she had received the first dose of GARDASIL without problems. Guillain-Barre syndrome, nausea and abdominal pain were considered to be other important medical events. Other business partner numbers include E2009-08410.

Other Meds: hormonal contraceptives (unspecified)

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse for GARDASIL, a pregnancy registry product, concerning an 18 year old female patient who in April 2008 was vaccinated with the second dose of GARDASIL. After receiving her second dose the patient became pregnant and miscarried. the last menstruation period was unspecified. She reported this to office after the event and they followed up with a Pap smear which came back normal. No lot number provided. At the time of report the patient's status was unknown. Upon internal review, miscarriage was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Anxiety, Aspiration pleural cavity, Breath sounds abnormal, Chest pain, Cough, Deep vein thrombosis, Dyspnoea, Iron deficiency anaemia, Lobar pneumonia, Pleural effusion, Pulmonary embolism, Renal failure acute, Respiratory distress, Respiratory rate increased, Tachycardia, Thrombosis, Viral infection

Symptom Text: Information has been received from a physician concerning a 19 year old female patient with no pertinent medical history and no known drug allergy who in August 2008 was vaccinated with the first dose of GARDASIL. In January or February 2009 the patient was vaccinated with the second dose of GARDASIL. Concomitant therapy included birth control pills (unspecified) for years. In May 2009, the patient developed a blood clot in the leg that resulted in a pulmonary embolism. She was hospitalized for several days. She was currently considered to be recovered but still taking COUMADIN. Her initial and second dose of GARDASIL were given at another office so no administration information available. The physician could not give any other details and said he was not consulted on this case. He learned of the incident through the patient's mother. He did not have the name of the physician who administered the GARDASIL, and did not know the name of the hematologist who followed the patient. The physician did not offer to contact the patient's mother to gain this information. The health care professional contacted during telephone follow-up could not supply the following information: dates of vaccination/therapy, lot numbers, healthcare provider name and contact information. Additional information has been requested. 9/18/09 Hospital records received DOS 5/27/09 to 6/4/09. Assessment: Right lower lobe pulmonary embolism acute. Left leg DVT. Iron deficiency anemia. Pleural effusion. Viral syndrome 3 weeks prior followed by difficulty breathing. Patient now c/o increasing chest pain and shortness of breath last 7 days. Could not breath. Respiratory distress. Nonproductive cough. Decreased breath sounds right side. Anxiety. Tachycardia. Increased respiratory rate. Thoracocentesis. Acute mild renal failure. Right lower lobe pneumonia. ICD-9 Codes: 415.19 Oth Pulm embolism/Infrac, 486 Pneumonia Organism NOS, 453.41 DVT Proximal Leg, 511.9 Pleural Effusion NOS, E932.2 ADV EFF Ovarian Hormones, 280.9 Iron Defic Anemia NOS, 5

MedDRA PT Grand mal convulsion, Incontinence, Loss of consciousness, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician concerning an 11 year old female who was vaccinated with the second dose of GARDASIL (dose, route, and lot not reported) one month ago (on approximately 03-AUG-2009). There was no other concomitant immunization medication. The patient experienced an an adverse event post vaccination with GARDASIL. 40 minutes post vaccination the patient had a "tonic clonic seizure event" in the car with her parents. The patient was taken to the doctor office for follow up. The patient recovered. It was noted that the patient was nervous about vaccinations and she had passed out after the first dose of GARDASIL. Upon internal review, "tonic clonic seizure event" was determined to be an other important medical event. Additional information has been requested. 9/29/2009 Received PCP medical records of 5/8/09-8/13/09 which reveal patient in usual state of health on 5/8/09. RTC on 8/13/09 w/report of 2nd episode of LOC & seizure w/jerking movements of arms/legs & incontinence lasting approx 1 min after receiving 2nd HPV. No further medical treatment was sought.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain lower, Condition aggravated, Cyst removal, Endometriosis, Ovarian cyst, Surgery

Symptom Text: Information has been received from a physician concerning a 24 year old female with bilateral ovarian cyst who on 27-DEC-2008 was vaccinated with the second dose of GARDASIL. Concomitant therapy included YASMIN. The reporting investigator mentioned that the patient had been diagnosed approximately in 2007 as bilateral ovarian cyst, and watchful waiting had been suggested. On 10-FEB-2009, the patient experienced low abdominal pain, so visited ER. On the same day, pelvic CT was done, and the results was 'interval increased size of septate cystic lesion in both adnexae - Endometriosis, most likely'. The patient was hospitalized to receive cyst removal on 25-FEB-2009, and the surgery was done on 26-FEB-2009. The patient was discharged on 27-FEB-2009. The reporting investigator felt that increased size of bilateral ovary cyst was not related to therapy with GARDASIL. Additional information has been requested.

Other Meds: drospirenone (+) ethinyl estradiol, 20Nov08-24Feb09

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a 22 year old female consumer with no pertinent medical history or drug reactions or allergies, for the Pregnancy Registry for GARDASIL, who on approximately 17-SEP-2008, "about two months ago", was vaccinated with the second dose of GARDASIL. There was no concomitant medication. On 17-NOV-2008, "today", she did a home pregnancy test and found out that she was pregnant. The LMP was 20-OCT-2008. No adverse event involved. The consumer reported that she had called her physician, but had not seen the physician as of yet. Follow-up information was received from the patient which reported that the pregnancy resulted in miscarriage after two months (on approximately 20-DEC-2008). The patient thought it was due to GARDASIL especially that "she was only 22 year old and already had one child". The patient stated that she never received her third dose. Upon internal review, miscarriage was considered to be other important medical event. The patient also reported that she recently got pregnant again (WAES # 0909USA00978). Additional information has been requested.

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Arnold-Chiari malformation, Dizziness, Headache

Symptom Text: Information has been received from a nurse concerning a 20 year old female with no drug allergies and no pertinent medical history who in 2006-2007 had possibly received the entire series of GARDASIL (LOT# not reported). the patient started having headaches in the winter of 2008. The MRI or computed axial tomography of the brain was performed on an unspecified date showing chiari malformations. Unspecified eye studies and a computed axial tomography of brain (CT scan) were also performed with no reported results. The patient had an office and emergency room visit. The patient continues to have persistent headaches. Follow-up information has been received via a telephone call from the nurse concerning the 20 year old female patient. The patient received GARDASIL while away at college several years ago. The nurse reported that the patient experienced chronic headaches for more than 6 months. The nurse also reported that the patient's first MRI was performed in January 2008 and was diagnosed with mild chiari malformations and the rest of the MRI was normal. On 02-AUG-2008 the patient went to the emergency room for headache and dizziness. The patient was admitted. They ruled out meningitides and performed another MRI where they concluded there was no change in the scan. The patient was discharged on 03-AUG-2008 with mild chiari malformations; the patient was under the care of a neurologist and was treated with unspecified medications. The patient was hospitalized. The patient's mother was questioning the relationship between her daughter's chronic headaches and her GARDASIL series; the office did not believe the headache was related to GARDASIL. Additional information is not expected.

Other Meds: None

Lab Data: magnetic resonance, 01/??/08, was diagnosed with mild CHIARI malformations and the rest of the MRI was normal; magnetic resonance, no change in the scan

MedDRA PT Convulsion

Symptom Text: Information has been received from a nurse practitioner concerning a 21 year old female with no known drug allergies or pertinent medical history who on 27-AUG-2009 was vaccinated with the first dose of GARDASIL (lot no.663454/0672Y). Concomitant therapy included ORTHO EVRA. On 27-AUG-2009 the patient experienced seizure 30 seconds following vaccination and quickly recovered. In follow up, the nurse practitioner reported there were no laboratory or diagnostic tests performed and no treatment necessary. Upon internal review seizure was considered to be an other important medical event. No further information is available.

Other Meds: ORTHO EVRA

MedDRA PT Arthritis reactive

Symptom Text: This case was initially reported to the Agency by the Health Authority, reference no: 20485001 on 03-SEP-2009. This case concerned a 17 year old female patient. Details of the patient's medical history and concomitant medication had not been reported. In May 2009 (exact date not reported), the patient received a dose of GARDASIL intramuscularly (batch number and site not reported). On an unreported date, two weeks post vaccination, the patient experienced reactive arthritis. The patient received treatment with DICLOFENAC and was then attending rheumatology. The patient had not recovered. Both the reporter and the Agency considered this to be a serious reaction due to disability and incapacity. This case is closed. Other business partner numbers included: E2009-08390. No more information is available.

MedDRA PT Autoimmune hepatitis, No reaction on previous exposure to drug, Transaminases increased

Symptom Text: Information has been received from a general practitioner concerning a 17 year old female who on 08-SEP-2008 and 27-JAN-2009 was vaccinated with the first (lot# 1114U, batch# NH10940) and second (lot# 0933U, batch# NH46260) doses of GARDASIL. The patient was well tolerated with the first dose of vaccination of GARDASIL. The patient was vaccinated with a third dose of GARDASIL (lot# 1050U, batch# NH32140) IM into the upper arm on 12-MAY-2009. On an unspecified date the practitioner visited and within the preparation of a dental operation the patient was diagnosed with elevated transaminases. A further blood sample was taken and showed increased values for antinuclear antibodies (ANA) (1:640) and anti-nuclear antibodies. Smooth muscle antibodies (anti-SMA) were positive (1:80). Electrophoresis was marginal pathologic. Virus hepatitis serology was negative. The diagnosis of autoimmune hepatitis was established. At the time of reporting, the patient had not yet recovered. Autoimmune hepatitis was determined to be an other important medical event. Other business partner numbers included: E2009-08391. No further information is available.

Other Meds: Unknown

Lab Data: diagnostic laboratory test, showed increased value for antimuscular antibodies; diagnostic laboratory test, virus hepatitis serology was negative; serum ANA, 1:640, increased value; serum antismooth muscle antibody test, 1:80, positive; ser

MedDRA PT Juvenile arthritis, Pain in extremity

Symptom Text: Information has been received from the parent of a 13 year old female who on 24-FEB-2009 was vaccinated with the third dose of GARDASIL, lot# 0858X, intramuscular in left deltoid. There was no concomitant medication. On 25-FEB-2009, the next morning, the patient's hands and feet hurt. The patient started ADVIL and naproxen. In approximately March 2009 (within 4 weeks), the patient experienced full-on juvenile arthritis, polyarticular. The patient was seen at the hospital. She is now on prednisone and methotrexate. Full-on juvenile arthritis, polyarticular was considered to be disabling. No further information is available.

MedDRA PT Abasia, Abdominal pain upper, Headache, Hypoaesthesia, Mobility decreased, Pain in extremity, Paraesthesia

Symptom Text: On 9/4/09@ 1400 client called me and notified me of the following information...9/3/09 @0630 client states woke up with tingling pain in bilateral lower extremities. States was able to attend school but also had tummy ache, head ache but no temp. Denies having taken any other meds to help aleve some of the discomfort. On 9/4/09@0630 client stated when getting out of bed that morning she was unable to walk due to pain in both legs. Client describes pain as feeling like your legs are asleep but they're tingling so bad it hurts to move them. States pain is bilateral lower extremities and nowhere else. Client denies having taken anything for the pain. I was taking the report on 9/4/09 at approx. 2pm and asked if she had taken any meds to help alleviate pain and client denies at this time, but does state that symptoms have subsided. I instructed her to see a pcp at the local walk in clinic immediately to evaluate symptoms. Client voices that she will do so as soon as we hang up. 9/7/09@0815 Phone call made to client to check on progress. Aunt state's she is better and is at school @ this time but will have patient call when she's back from school today. 9/8/09@1600 patient returns call and states that all the s/sx have disappeared. She worked an 8 hour shift on that Saturday 9/5/09 following onset of her s/sx and did fine. Denies having seen a doctor for any follow up care states that she feels fine and didn't feel like she needed further care.

Other Meds: zicam taken 9/6/09

Lab Data: None

History: allergy to peanuts

MedDRA PT Caesarean section, Drug exposure during pregnancy, Prolonged labour

Symptom Text: Information has been received from a nurse for GARDASIL, a pregnancy Registry Product, concerning a 19 year old female who on 29-FEB-2008 was vaccinated with the third 0.5mL dose of GARDASIL intramuscularly. Concomitant therapy included "Tetanus shot". Subsequently, she became pregnant. On 11-NOV-2008 the patient delivered her baby and both the mother and the baby were fine. No adverse effect reported. No lab diagnostics studies were performed. Follow-up information has been received from a licensed practical nurse, for GARDASIL, a Pregnancy Registry product, concerning a 19 year old female patient with no medical history and no concurrent medical conditions and a history of 1 pregnancy and 1 live birth with no birth defects or infant complications in previous pregnancy. Who on 29-AUG-2007 and on 02-NOV-2007 was vaccinated with the first and second doses of GARDASIL. On 29-FEB-2008, the patient received the third 0.5 mL dose of GARDASIL intramuscularly. Concomitant therapy included Tdap and prenatal vitamins (unspecified). On 11-NOV-2008 the patient had a cesarean section due to prolonged labor and delivered a normal, healthy female baby with no congenital anomalies weighing 7 pounds, 4 ounces, 20 in length, head circumference 33cm, and APGAR score of 9/9. There was not complication during pregnancy, and not infections or illness during pregnancy for the patient. There was not diagnostic test during pregnancy. Upon internal review, prolonged labor was considered to be an other medically important event as it resulted in a cesarean section. Additional information is not expected.

Other Meds: vitamins (unspecified)

MedDRA PT Laboratory test, Pulmonary thrombosis

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 17 year old female with no known medical history and no known previous illness on 21-AUG-2007 was vaccinated with the fourth dose of GARDASIL (Lot # 654741/1208F) IM into the right arm. It was reported that on 12-APR-2009 the patient had blood clot in lung and would have to be on blood thinners the rest of her life. She was on 15 mg of "warfarin" daily to keep her blood thinned between 2-3 INR. The patient was hospitalized for 5 days, and they ran all the relevant tests for blood clots. Then the patient went to the clinic, and they ran numerous tests related to blood clots and the patient did not have any risk factors associated with blood clotting. The listing indicated that one or more of the events required hospitalization, was considered to be disabling and was considered to be immediately life-threatening. It was reported that the event required ER visit. The event was serious. The original reporting source was not provided. The VAERS ID # is 357350. No further information is available. A standard lot check investigation has been finalized. All in-process quality checks for the lot number in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the Center for Biologics Evaluation and Research and was released.

MedDRA PT Caesarean section, Complication of delivery, Drug exposure during pregnancy

Symptom Text: This is a case of pregnancy follow-up reported by a general practitioner through the GARDASIL pregnancy registry. Initial report on 06-MAR-2008: A 17 year old female started a spontaneous pregnancy (estimated conception date: 15-FEB-2008) 5 days after receiving a dose of GARDASIL (batch number not reported) on 10-FEB-2008. She had no medical or obstetric history, estimated delivery date was 15-NOV-2008. No adverse effect was reported. Follow-up information received through the GARDASIL pregnancy registry initial questionnaire: Vaccination date was reported as 01-FEB-2008 (previously reported as 10-FEB-2008). Estimated date of conception was 14-FEB-2008. Echographies at 12, 22 and 32 amenorrhea weeks normal. The patient had no amniocentesis. Follow-up information received through the outcome pregnancy questionnaire on 08-JAN-2009: Case upgraded to serious. There was no complication during the pregnancy. Diagnostics performed during pregnancy were normal. There was no infection and no disease during pregnancy. there were no complication during labor and the patient had a caesarean section on 30-OCT-2008. She gave birth to a normal baby girl at 38 amenorrhea weeks. Baby's height was 46cm, weight was 2kg835, cranial perimeter was 33cm. Follow-up information received by telephone on 10-SEP-2009: It was confirmed that the baby was in good health with no particular problems. Complication of delivery was considered to be an other important medical event by the general practitioner. No further information expected. Other business partner numbers included E2008-02173.

Other Meds: Unknown

Lab Data: ultrasound, at 12 amenorrhea weeks was normal; ultrasound, at 22 amenorrhea weeks was normal; ultrasound, at 32 amenorrhea weeks was normal

MedDRA PT Autoimmune thrombocytopenia, Biopsy bone marrow, Cytology, Reaction to previous exposure to any vaccine

Symptom Text: Case received from health authority in a foreign country on 08-SEP-2009 under HA reference no. PEI2009019595. This case is linked with non serious case E2009-08535 (same reporter, same product, same patient, different reaction after D1). It was reported that a 15 year old female patient was vaccinated with a third dose of GARDASIL (batch number NG00020, Lot#0277U) IM, injection site not reported, on 27-NOV-2007. Nine months p.v., on 01-SEP-2008, the patient developed autoimmune thrombocytopenia (Werlhof's syndrome coded by HA PEI). On 02-JUL-2009 bone marrow biopsy and cytology were done but results were not reported. At the time of report to HA (04-SEP-2009) the patient was not recovered. Patient showed tinnitus, headache and concentration disturbances on 01-AUG-2007 after D1 of GARDASIL (batch NE38100, Lot#654948/0903F) administered on 31-MAY-2007. D2 of GARDASIL (Lot# not reported) on 08-AUG-2007 was well tolerated. The agency considered the event to be serious for the following reason: medically significant. Other business partner numbers included E2009-08534.

MedDRA PT Paralysis

Symptom Text: Initial and follow-up information has been received from a physician's assistant concerning a patient's family member who on an unspecified date was vaccinated with a dose of GARDASIL. The physician's assistant mentioned that the patient experienced paralysis waist down. She also stated she did not know the patient's name or any information concerning the patient. The physician's assistant stated her patient had reported that the patient's cousin had heard that there was a patient who received GARDASIL and had paralysis from the waist down. The physician's assistant did not remember the patient's name that had reported the incident to her. Upon internal review paralysis is considered to be other important medical event. No further information is available.

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Arthralgia, Asthenia, Fatigue, Headache, Increased tendency to bruise, Infection, Migraine, Myalgia

Symptom Text: Information has been received from a registered nurse concerning her daughter who had been vaccinated with three doses of GARDASIL and after the second dose began experiencing headaches. The patient was not hospitalized. The patient was seeing a rheumatologist. Follow-up information was received from a 23 year old female patient. She reported she in June 2007, August 2007 and December 2007 was vaccinated with the first, second and third dose of GARDASIL (lot numbers not reported) respectively. There was no illness at time of vaccination and there was no pre-existing allergies, birth defects or medical conditions either and "she was never a sick child or a sick adult". On 01-OCT-2007 morning the patient started to experience migraines. The patient reported she had constant migraine since then. She had seen a neurologist multiple times. She had an MRI, and MRV and and MRA done in late 2007 and they all showed no complications. She had been prescribed amitriptyline hydrochloride, ZOMIG, FROVA, FIORICET, TOPAMAX, INDERAL, lisinopril among others, not one of these medications helped her migraines. she saw her original primary care doctor and now being followed by her new primary care physician. She had multiple infections, many times getting tested for Lyme disease (negative) and other blood tests (negative). She was in constant crippling pain from her migraines, as well as muscle joint pain and weakness, and frequently getting infections. She had been bruising especially easily since October 2007 also. She was tested for VON WILLEBRAND'S Disease, but results were negative here as well. Her new primary doctor had recently diagnosed her with chronic fatigue and referred her to a Rheumatologist, which she had scheduled an appointment. The patient strongly believe her symptoms are side effects caused by the GARDASIL vaccine. She reported she had none of these symptoms prior to receiving the vaccine, and there was no medical explanation to her symptoms as of yet. The patient was not recovered. The patient's events were co

MedDRA PT Arthralgia, Bone pain, Condition aggravated, Epilepsy, Pain in extremity

Symptom Text: Information has been reported on 02-SEP-2009 by the mother of the patient and additional information was reported by the mother on 07-SEP-2009 and by healthcare professional on 09-SEP-2009. It was reported that a 17 year old female was vaccinated with the third dose of GARDASIL (Batch# NJ11570, LOT# 1864U) on 10-JUL-2009. The first and second dose of GARDASIL was given on 16-JAN-2009 (Batch# NH01650, LOT# 1145U) and 17-MAR-2009 (Batch# NJ03220, LOT# 1881U), respectively. The mother recalled the girl being more tired than usual during spring 2009, however she was not certain whether this appeared in connection to the vaccinations or not. Patient had tuberous sclerosis and epilepsy. She was treated with PETNIDAN since March 2009 and TRILEPTAL since many years. She also had a speech disturbance making it difficult to communicate. On 06-AUG-2009 the girl developed pain in her right side that gradually translocated to the joints in the arms, legs and feet. No pain in the face, abdomen or back. There was no swelling or headache. Applying some pressure in these regions resulted in pain. With time the pain was translocating over her body. At some points she had pain in her entire thigh muscle. According to the mother the girl never complaints, however now she was very clear with where she was experiencing pain. The mother recalled that there might have been some minor epileptic attacks during the time the girl experienced the pain. The pain remained for approximately five days and then disappeared. On 12-AUG-2009 the same pain returned and once again the girl improved after five days. On 06-SEP-2009 the pain once again appeared. This time the pain was localized to the feet and the tibia bone. The patient was not recovered at the time of the report. This case was considered to be serious due to other important medical event. Other business partner numbers included: E2009-08531. No further information is available. Case is closed.

MedDRA PT Drug exposure during pregnancy, Idiopathic thrombocytopenic purpura

Symptom Text: Information has been received from a physician, for GARDASIL, a Pregnancy Registry product, concerning a 16 year old female with no pertinent medical history or drug reactions who was vaccinated with at lease one dose of GARDASIL (lot#, route and site of administration not reported) in the last 4 weeks. Concomitant therapy included prenatal vitamins. The patient was pregnant and developed immune thrombocytopenia purpura. On approximately 14-AUG-2009 ("4 weeks ago"), the patient's platelet level, 8000/L, was extremely low. On 04-SEP-2009 she started with treatment with prednisone 20 mg, twice daily. Her platelet level was already 116000/L. Other than the low platelet the patient was asymptomatic. At the time of this report, the patient had not recovered. The patient's "due date" was 20-APR-2010. Follow up information has been received from a registered nurse who stated that on 23-AUG-2009 the 16 year old female patient was in a fight and received an injury to her eyes and head. The patient was 7.5 weeks pregnant at the time. She underwent a CT of the head (hospital location and results not available). No blood work was done at that time. On 04-SEP-2009 her blood work was drawn and the platelet result was 8000. The patient was diagnosed with immune thrombocytopenia purpura. Additional follow up information has been received from a licensed practical nurse concerning the 16 year old female patient who on 15-JUN-2009 was vaccinated with the first dose of GARDASIL (lot# 659441/1446U, route and site of administration not reported). On 17-AUG-2009 she was vaccinated with the second dose of GARDASIL (lot#661953/1130X, route and site of administration not reported). No other vaccines were administered on these two dates. Upon internal review, the immune thrombocytopenia purpura was determined to be an other important medical event. Additional information has been requested. 10/01/09 Received PCP medical records. FINAL DX: Idiopathic Thtombocytopenic Purpura Records reveal patient in usual state of good health on 6/15

Other Meds: vitamins (unspecified)

MedDRA PT Human papilloma virus test positive, Precancerous cells present

Symptom Text: Information has been received from a physician assistant concerning several "30's" female patients who were vaccinated with GARDASIL series on unspecified date and a couple of years later test positive for HPV. There patients had gone to an office and had Pap's that came back as high risk. These were precancerous cells. The reporter mentioned most of these patients were married. The reporter thought the patients test that came back as high risk were for the HPV types that GARDASIL did not cover. One of these patient's physicians "froze the precancerous cells". The number of patients was unknown. At the reporting time the outcome was unknown. Upon internal review, precancerous cells and test positive for HPV were determined to be other important medical events. Additional information is not expected.

MedDRA PT Condition aggravated, Convulsion, Epilepsy, Immediate post-injection reaction

Symptom Text: Information has been received from a physician's assistant concerning a 14 year old female with a history of a seizure when she was 10 years old who on 21-AUG-2009 was vaccinated with a 0.5 mL dose of GARDASIL (lot # 659054/0311Y). Secondary suspect vaccination given on the same date included doses of VARIVAX (Merck), VAQTA (Merck), MENACTRA, and ADACEL. The patient had a seizure right after getting the vaccinations. She was taken to the emergency room and was given phenytoin 100 mg BID (manufacturer/description unknown). They wanted the patient to follow up with a neurologist. Therapy with GARDASIL Was discontinued. Subsequently, the patient recovered from seizure. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested. 9/25/09 PCP medical records received DOS 8/21/09. Assessment: Unspecified epilepsy without mention of intractable epilepsy. Patient was sent to ER for seizures after vaccine administration. 12/9/09 Received ER medical records of 8/21/09. FINAL DX: Records reveal patient very scared of receiving shot & experienced seizure like activity same day. Not on seizure meds. Dilantin restarted, d/c to home & referred to PCP 12/16/09 Medical records received for dates 9/3/09 to 9/16/09 DX: seizure disorder. Pt presented w/ seizure after gardasil vax dose 1. ER recs received for date 8/21/09 DX: seizure. pt was receiving vax, pt stated scared of needle, and had aseizure.

MedDRA PT Condition aggravated, Convulsion

Symptom Text: Initial report received on 22 September 2009 from another manufacturer (report number WAES 0909USA01474) who had received the original report from a physician's assistant. The following is verbatim from the other manufacturer's report. "Information has been received from a physician's assistant concerning a 14 year old female with a history of a seizure when she was 10 years old who on 21-AUG-2009 was vaccinated with 0.5 mL dose of GARDASIL (lot # 659054/0311Y). Secondary suspect vaccination given on the same date included doses of VARIVAX (Merck), Hepatitis A virus vaccine inactivated (manufacturer unknown), MENACTRA and ADACEL. The patient had a seizure right after getting the vaccinations. She was taken to the emergency room and was given phenytoin 100 mg BID (manufacturer/description unknown). They wanted the patient to follow up with a neurologist. Therapy with GARDASIL vaccine was discontinued. Subsequently, the patient recovered from seizure. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested." Documents held by sender: None.

MedDRA PT Convulsion, Fatigue

Symptom Text: Initial report received on 08 September 2009 from another manufacturer, report # WAES0908USA04708 whose initial reporter was a health care professional. "Information has been received from a physician and an office manager concerning a 12 year old female patient with amoxicillin allergy who on 26-AUG-2009 was vaccinated with the first 0.5 ml dose of GARDASIL, concomitantly with a dose of (BOOSTRIX) (Lot : AC528046AA), a dose of VARIVAX (Lot : 664232/0498Y) and a dose of (MENACTRA) (Lot: U2815AA). The patient stated that after the vaccination she felt tired. She went home and had a seizure. the patient went to the emergency room and had computed axial tomography (CAT) done (results not reported). The patient was not hospitalized. The patient's mother called on 27-AUG-2009 at the physician's office and stated that her daughter was doing better. The physician also stated that her did not consider the events to be life threatening or to have caused the patient significant disability or incapacity. Upon internal review the seizure was considered as other important medical event. Additional information has been requested".

Other Meds:

Lab Data: 26 August 2009: computed axial tomography (CAT), (results not reported).

History: Patient has a penicillin allergy.

MedDRA PT Grand mal convulsion

Symptom Text: Information has been received from a pediatrician concerning a 13 year old female who on 25-JUN-2009 was vaccinated intramuscularly into the upper arm (side not reported) with the first dose of GARDASIL (LOT#1400U, Batch#NH38510). On 28-JUN-2009 after arriving to a city per flight the patient experienced a first grand mal epileptic fit with duration of approximately five minutes. The patient recovered completely. The reporter assessed the relation to the vaccine as possible and underlined that attendant circumstances could have been stress due to holiday trip. Grand mal epileptic fit was considered to be an other important medical event. Other business partner numbers included: E2009-08565. No further information is available. File is closed.

MedDRA PT Excoriation, Fall, Feeling hot, Gait disturbance, Immediate post-injection reaction, Visual impairment

Symptom Text: Approximately 2 minutes after receiving Tdap, MCV4 and HPV, client was observed with an unsteady gait. Client hit the side of a hallway wall with right eyebrow, right side of cheek and between nose and lip. Small abrasion observed to area between nose and lip. Client reported that she "got hot all of a sudden and could not see". Nurse was able to catch the client when falling. Client was eased to the floor. BP was taken (98/62)and a cool cloth applied to forehead, face and neck. Client was then assisted to an exam table and lower extremities were elevated. Client remained in clinic for approx. 20 minutes. Left with mother in stable condition. Instructed to go to ER if any signs of nausea, vomiting, headache, blurred vision, etc. Follow-up phone call to mom approx. 1 hour later. Mom reported client feels better.

MedDRA PT Acne, Back pain, Headache, Local swelling, Lymph node palpable, Lymphadenitis, Lymphadenopathy, Mass, Musculoskeletal stiffness, Nasal congestion, Nasopharyngitis, Neck pain, Pain, Pharyngeal erythema, Pyrexia, Scab, Torticollis, Vomiting

Symptom Text: Five days after receiving the guardisil shot in her left arm she awoke with a painful lump above her left clavicle. Ten days after the lump, she saw the doctor who ran strep and mono quick tests, both were negative. The doctor ordered E.B.titers, CBC and sed rate. All tests results were normal. On 9-3-09 she was back in the Doctor's office with low grade fever. Doctor thought it might be sinus infection and gave her Azithromycin. The lump did not go away during the course of treatment with antibiotics it just became less tender. On 9-16-09 the tenderness of the lump has increased again. The size of the lump remains the same to date. We do not know if the lump formed immediately after her shot or if the level of pain on the 5th day led her to find the lump. 9/22/09 Received PCP medical records. Visit on 8/27/09 w/neck stiffness, swelling & tenderness & left supraclavicular node x 10 days; HA & vomiting x 2 days. Also noted pimple of left cheek that enlarged & burst spontaneously then scabbed over. Dx w/Torticollis left side & cervical adenitis. All labs neg. RTC 9/3 w/cold s/s, red throat, nasal congestion & backache. Tx w/oral antibiotics. No further medical records available.

MedDRA PT Abnormal dreams, Alopecia, Areflexia, Diarrhoea, Dysphagia, Dysstasia, Facial paresis, Fall, Gait disturbance, Guillain-Barre syndrome, Head deformity, Headache, Lymphadenopathy, Muscular weakness, Myalgia, Pain, Paraesthesia, Paraparesis, Reaction to previous exposure to any vaccine, Sleep disorder, Speech disorder, Vomiting, Weight decreased

Symptom Text: Information has been received from a health authority (reference # PEI2008009402) concerning a 17 year old female who on 13-DEC-2007 was vaccinated with a third dose of GARDASIL (lot # not reported). On 24-APR-2008 the patient was diagnosed with GUILLAIN-BARRE syndrome. The adverse event lasted for more than one month. The reporter did not see a causal relation to the vaccine. The final outcome was not reported. Follow-up information received on 08-SEP-2009. Reporting form was provided from database of an independent information service for physicians and pharmacists, reference number 15018). Unspecified time after third vaccination the patient experienced pain of the whole body, headache, vomiting, diarrhoea, swollen lymph nodes and alopecia. Then, 3 months post vaccination, she suffered from paraesthesia in legs and hands, myasthenia in arms and legs, a singular fall due to gait disturbance and myalgia. At clinical investigation in hospital on an unknown date the patient showed distal paraparesis of the legs, loss of reflexes of the lower extremities and instable gait and stand. Diagnosis of GUILLAIN-BARRE syndrome was established. With admission laboratory test showed increased transaminases and LDH (lactic dehydrogenase), no values available. During acute phase of disease (not specified) the patient suffered from weight loss of 9 kg, physical strain due to facial paresis with facial asymmetry, speak and swallow disorder, impaired mimic, sleep disorder and abnormal dreams. After outpatient rehabilitation lasting several weeks the symptoms improved and the patient attended school again. Final outcome was not reported. Dose one of GARDASIL was given on 15-MAY-2007 and was well tolerated. After second vaccination with GARDASIL on 01-AUG-2007 the patient experienced twice syncope (see linked case E2009-08550). GUILLAIN-BARRE syndrome, facial paresis, alopecia, sleep disorder, abnormal dreams, general body pain, weight loss, diarrhoea, transaminases increased, lactate dehydrogenase increased, swollen lymph nodes, v

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Brain stem auditory evoked response normal, Hearing impaired, Neurosensory hypoacusis, Tinnitus

Symptom Text: Information has been received from on 11-SEP-2009 from the drug safety unit at GSK, regarding a female patient, age not reported, with hyperprolactinaemia, pneumonia fungal and weight decreased and a history of perianal abscess and herpes zoster who was administered in February 2009, exact date not reported, the third dose of GARDASIL (route, site of administration and lot number not reported). The case was initially reported by a Health Care Professional to GSK drug safety unit who transmitted the case to the Health Authority (reference number: ES-GLAXOSMITHKLINE-B0582547A). Afterwards it was reported that GARDASIL and not (CERVARIX) was administered. It was reported that on 21-JUN-2009 the patient presented tinnitus after a train trip. On 26-JUN-2009, the patient had a hypoacusis sensation in the right ear. Physical exploration was normal. An audiometry was performed, results, showed a deep right ear neurosensorial hypoacusis of the right ear. During the next week the patient presented with right ear auditive level fluctuations with an improving trend, and also with a left ear moderate neurosensorial hypoacusis with a favourable evolution, finally it was reported that the patient has audiometric levels of 20 dB in both ears. Brain stem auditory evoked potential was performed on 01-JUL-2009 with normal hearing levels up to 20 dB in the left ear and 60 dB in the right ear. The results regarding evolution of potentials were still pending. Additional test performed (date not reported) were: Thyroid study LH, LSH, prolactine and estradiol. All values were normal. The patient presented with immunoglobulin G positive against CMV (pending results of the second sample). Final MRI: brain stem and acoustic pores with no significant findings. The reporter felt that Neurosensory hypoacusis, tinnitus, Auditory disorder, CMV IgG antibody positive were other important medical events. Other business partner numbers include E2009-08656. No further information is available.

Other Meds: Unknown

Lab Data: hearing test, 01Jul09, normal hearing levels up to 20 dB in the left ear and 60 dB in the right ear; magnetic resonance imaging, brain-stem and acoustic pores with no significant findings; diagnostic laboratory test, LSH-Normal values; seru

MedDRA PT Drug exposure during pregnancy, Intra-uterine death, Pre-eclampsia, Pregnancy induced hypertension

Symptom Text: Information has been received from a pregnancy follow-up report received from the Health Authorities through the GARDASIL Pregnancy Registry concerning a 16 year old female who on an unspecified date was vaccinated with GARDASIL (batch number, route and site of administration was not reported). On an unspecified date, four months after the beginning of her pregnancy (estimated conception date was not reported). No adverse reaction was reported. Follow-up information received through a telephone call on 11-SEP-2009. Case linked to serious case E2009-08663 (WAES# 0909USA01936) (Child's case). Case upgraded to serious up on the basis of the following information: The patient received a dose of GARDASIL (batch number not reported) and a dose of DT POLIO (batch number not reported) on an unspecified date, four months after the beginning of her pregnancy. Estimated conception date was 20-AUG-2007. On an unspecified onset of time, she experienced pregnancy-induced hypertension and pre-eclampsia. On 29-APR-2008, the baby died at 37 amenorrhea weeks of fetal death. There was no information on the patient's medical history, on risk factors nor on her pregnancy follow-up. At the time of reporting the patient's outcome was unknown. Upon internal review, pre-eclampsia was determined to be an other important medical event. Other business partners included are: E2008-00543. No further information expected.

MedDRA PT Concussion, Erythema, Fall, Head injury, Hyperhidrosis, Nausea, Syncope, Unresponsive to stimuli

Symptom Text: Pt was given 3 immunizations and was being instructed by MA to remain seated when pt had an episode of vasovagal syncope and fell off exam table and onto floor. She did strike her head. Pt was noted to be unresponsive for no more than several seconds by MA. Dr. was called into room immediately and found pt responsive at that time, breathing, with good color, and sitting on floor. Pt was lifted to table with assist of 3 staff and found to be diaphoretic and nauseated but did not vomit. Pt showed no focal neurologic signs. She did have mild erythema over the forehead, otherwise no head or facial swelling. On physical assessment, no other signs were noted and pt was following commands. Pt was observed for approx 10-15 minutes prior to being sent for head CT, which was negative for skull fx or internal head injury. Pt mother was advised by Dr. that pt sustained a concussion from the fall, and pt may c/o HA for a week or so. Pt mother advised to call if any change in pt condition or onset of new symptoms. Pt was observed in clinic setting for total of about 2 hours prior to leaving.

MedDRA PT Acne, Autoimmune thyroiditis, Epstein-Barr virus infection, Fatigue, Goitre, Headache, Hypersensitivity, Hypothyroidism, Infectious mononucleosis, Insomnia, Menorrhagia, Menstrual disorder, Myalgia, Pharyngitis streptococcal, Sensation of heaviness, Swelling, Swelling face, Weight increased

Symptom Text: extreme fatigue, mono, chronic strep throat, Hashimoto's, extreme face and body swelling, aching muscles. Got first vaccine 7/10/09 Lot 0072X in conjunction with Menactra vaccine. Second vaccine 12/22/08 Lot 1311X. Went to college on cross country scholarship. Started off season great. She said she started noticing that she was having trouble running mid October and that her legs felt heavy. Starting getting facial swelling second week of January. Went to doctor and they said it was allergic reaction. Got sick in February - dx with strep. Didn't get better. Went to ER end of March with extreme facial swelling. Told her it was allergy and gave her prednisone. Re-dx with strep again in early April and then mono April 9th. Got really sick and could not get better. Extreme facial and body swelling. Dx with Hashimoto's June 29th. and started thyroid treatment. Was not able to return to college in August and is still home. Started getting muscle soreness in July. Made Gardasil connection 2 weeks ago and is going to begin treatment by doctor who has helped several other gardasil patients. 10/13/09 Medical records received, Dates of Service 4/19/09-8/10/09. Dx: Other Specified Acquired Hypothyroidism, Abnormal Weight Gain, Oligomenorrhea, Fatigue, Thyromegaly. Presenting Sx: Pt. experienced an approximately 40 lb. weight gain over a 1 to 2 month period, additionally she c/o fatigue, trouble sleeping and staying asleep, facial swelling, swelling around eyes, acne, one terminal hair periumbilical, headaches and a heavy period. Pt. saw a nutritionist and was put on a diet plan. She experienced menarche at age 13 and had irregular periods for several years (approximately 6 periods/yr.). Ortho Tri-Cyclene-Low was initiated which she took for several years, but stopped early this year after missing several pills. She re-started the pill a few months ago. Concomitantly, she takes Synthroid, Cosyntropin and furosemide. She was diagnosed with mononucleosis in April, and tested positive for Epstein-Barr Virus in May. H

Other Meds: none

Lab Data: mono - April 9, 2009 and June 30, 2009. Two Positive strep tests. Tested positive Hashimoto's - 6/30/2009. Thyroid Uptake and ultrasound confirmed thyroid on low side of normal -nothing accounted for extreme symptoms she was experiencing.

History: Ortho-tryclen Low. 10/13/09 Medical records received, Dates of Service 4/19/09-8/10/09. PMH: Streptococcal infection 4/9/09, ear infections, mononucleosis 4/12/09, Allergic to Penicillin.

MedDRA PT Immediate post-injection reaction, Loss of consciousness, Syncope, Tonic clonic movements

Symptom Text: This case was reported by a regulatory authority and descried the occurrence of vasovagal syncope in a 14-year-old female subject who was vaccinated with DITANRIX adult (GlaxoSmithKline), (non-GSK) GARDASIL. The subject's medical history included syncope without loss of consciousness. On 28 August 2009 the subject received unspecified dose of DIANRIX adult (intramuscular), unspecified dose of GARDASIL (intramuscular). On 28 August 2009, immediately after vaccination with DITANRIX adult and GARDASIL, the subject experienced vasovagal syncope with loss of consciousness lasting 1 minute and tonic clonic movements lasting seconds. The regulatory authority reported that the events were clinically significant (or requiring intervention). Relevant test included normal blood glucose, normal neurological examination as well as electrocardiogram. On 28 August 2009, the subject recovered spontaneously. The vaccination course with DITANRIX adult was discontinued. The regulatory authority reported that the events were possibly related to vaccination with DITANRIX adult and GARDASIL. No further information was available as this was all the information that regulatory authorities had.

MedDRA PT Acne, Adenoiditis, Bronchitis, Dehydration, Haematuria, Hypertension, Inappropriate schedule of drug administration, Iron deficiency anaemia, Migraine, No reaction on previous exposure to drug, Palpitations, Tonsillitis, Xanthelasma

Symptom Text: Information has been received from a certified medical assistant concerning a 29 year old female who on 25-SEP-2008 was vaccinated with a first dose of GARDASIL. The patient developed high blood pressure. The patient had always had normal blood pressure. Her blood pressure on 02-OCT-2008 was 148/88 and on 06-JAN-2009 it was 158/98. The patient sought unspecified medical attention. The patient's outcome is unknown. Follow up information received on 14-SEP-2009 from a physician indicated that the patient was a 28 year old female with no medical history, allergies or illness at the time of vaccination; it was also reported that the patient did not experience any adverse events following prior vaccinations. On 25-SEP-2008 at 10:15 was vaccinated with the first dose of GARDASIL (lot # 661764/0650X), intramuscularly. The patient received a second dose of GARDASIL (lot # 661764/0650X), intramuscularly on 20-NOV-2008 at 10:00. In October 2008, after the 2 doses of GARDASIL the patient developed high blood pressure. The patient was treated with hypertensive medication. The patient had an electrocardiogram done. At the time of this report the patient had not recovered. High blood pressure was considered to be an other important medical event. No further information is available. 9/30/09 Received PCP medical records of 6/30/09- Records reveal patient was new patient to practice on 6/30 for essential hypertension management & had palpitations, microscopic hematuria, migraines, iron def anemia & acne. Work up had been done be another MD. Exam revealed xanthelasma. BCPs had been d/c for 1 wk. Advised against restarting & was also advised to d/c all meds due to probable drug induced HTN. RTC 8/6/09 w/fever, cold s/s, enlarged & tender cervical lymph nodes. Dx w/chronic tonsillitis & adnoiditis, dehydration. Tx w/oral antibiotics. Did not improve & RTC 8/13/09 w/wheezing & SOB. Dx w/acute bronchitis. Tx w/steroids, nebs, continued antibiotics & cough syrup. RTC 9/10 w/continued HTN, restarted on anti-HTN meds &

MedDRA PT Drug exposure during pregnancy, Premature labour

Symptom Text: Information has been received from a office manager, for GARDASIL, a Pregnancy Registry Product, concerning a 23 year old female who on 11-SEP-2008 was vaccinated with the first dose of GARDASIL (0.5ml, IM). On 31-OCT-2008 the patient received the second dose of GARDASIL (0.5ml, IM, lot# 659653/1448U). Concomitant therapy included omeprazole and DIFLUCAN. Subsequently the patient got pregnant on an unspecified date. In April 2009, the baby girl was born prematurely and was on an incubator. The patient had a 2 month postpartum visit on 30-JUN-2009. A physician had a note in a chart saying the third dose of GARDASIL would hold off since the patient was breastfeeding. At the reporting time the outcome was unknown. Additional information has been requested.

MedDRA PT Anticoagulant therapy, Back pain, Chest pain, Oral contraception, Pain, Painful respiration, Pulmonary embolism

Symptom Text: Information has been received from a medical assistant concerning a 16 year old female patient with pertinent medical history reported as none and drug reactions or allergies reported as none who on 02-JUN-2008 was vaccinated with a first dose of GARDASIL. On 31-JUL-2008 she received a second dose of GARDASIL (lot #660553/0070X). On 11-DEC-2008 she received third dose of GARDASIL (lot #660553/0070X). Concomitant therapy included hormonal contraceptives (unspecified). On 18-JUN-2009, the patient went to the emergency room with a pulmonary embolism and was admitted to the hospital. The patient had been placed on COUMADIN. On an unspecified date the patient recovered from the pulmonary embolism (PE). Follow up information has been received via telephone call from a licensed practical nurse who reported that on an unspecified date, the patient was placed on oral contraceptive (name not available) for heavy menses. On 02-JUN-2008 the patient received HAVRIX (unspecified) (lot # AHAVB264CA) and MENACTRA (lot # U2623AA) in addition to first dose of GARDASIL. On 31-JUL-2008 no other vaccines were given. On 11-DEC-2008 she received HAVRIX (unspecified) (lot # AHAVB291CA) and FLUZONE (lot # U2083AA) in addition to third dose of GARDASIL. On 18-JUN-2009 the patient presented to the emergency room with chest and back pain. Chest computed axial tomography showed multiple PEs in both lower lobes and the patient was hospitalized. The patient was started on heparin drip, oral contraceptive was discontinued (patient told never to resume it again); switched from heparin to LOVENOX injections. On 22-JUN-2009 the patient was discharged, the patient was placed on oral COUMADIN. At the time of discharge the patient was able to resume all previous activities. Chart did not show if the event was considered life threatening. No further information is available. 9/29/09 ER records received DOS 6/18/09. Assessment: R/O Pulmonary Embolism. Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abdominal discomfort, Cold sweat, Convulsion, Dyskinesia, Gaze palsy, Immediate post-injection reaction, Lethargy, Musculoskeletal stiffness, Opisthotonus, Pallor, Posturing, Syncope, Unresponsive to stimuli

Symptom Text: Immediately after receiving vaccinations, patient arched back, neck extended back and to the right, eyes fluttered and rolled back. Patient not responsive; not answering questions or talking. She was eased from the chair to the floor. Her body was stiff and jerking and had to be fully supported by 2 individuals. The jerking stopped within 2 minutes. Patient remained lethargic, eyes opened and then slowly closed repeatedly for the next ~15 minutes. Patient complained of upset stomach immediately following seizure-like activity, but denied needing to vomit. Skin was pale and moist. 10/7/09 ER records received for date 9/21/09. DC DX: seizure vs. syncope. Presenting sx: As pt was receiving vaccine, she arched her back, may have had loss of consciousness and/or seizure. Pt states in ER feeling fine. Assessment: PE WNL. ICD9 codes: 781.0, 780.39.

Other Meds: None

Lab Data: Patient transported by ambulance to PV ER. Testing done on blood (chemistries) and urine (UA and pregnancy test); all within normal limits other than slightly elevated Chloride level. No radiolgic testing done. Diagnosis was seizure vs.

History: Told by guardian/translator that patient had a history of seizures. She had not had any seizures since coming to the US in 2/09. She saw a doctor and had blood work done on 9/21, but was on no meds a time of vaccinations. 10/7/09 ER records received for date 9/21/09. PMH: 3 previous sycopal episodes in past 3-4 yrs.

MedDRA PT Alanine aminotransferase, Alanine aminotransferase normal, Aspartate aminotransferase normal, Blood bilirubin, Blood bilirubin normal, Blood chloride, Blood lactate dehydrogenase, Blood potassium, Blood smear test normal, Blood sodium, C-reactive protein, Epstein-Barr virus antibody negative, Haemoglobin normal, Idiopathic thrombocytopenic purpura, Mouth haemorrhage, Nausea, No reaction on previous exposure to drug, Petechiae, Platelet count decreased, Pyrexia, Red blood cell sedimentation rate, White blood cell count

Symptom Text: Initial case reported on 17-SEP-2009 by Health Authority (HA reference number DK-DKMA-20092675) to local subsidiary. It was reported that a 13 year old female was vaccinated with her third dose of GARDASIL (intramuscularly, batch number NK14370, lot number NJ28270) on 20-JUL-2009. Later on the same day (not further specified), the patient experienced febrile reaction and nausea. It was reported that the patient on the day of vaccination was babysitting a child which vomited. Five days later on 25-JUL-2009 the patient developed petechia on the legs which spread to general petechia. Ten days after vaccination on 30-JUL-2009 the patient was admitted to a hospital ward for children with petechia on the skin and on oral mucosa. At this time, the patient did not have fever (cessation date not reported). Idiopathic thrombocytopenia purpura was suspected. Laboratory analysis showed thrombocyte count of 1 x 10E9/L (low), normal Hgb, Leu., CRP, SR, ASAT, ALAT, LD, s-bilirubin and sodium, potassium and chloride (not further specified). The patient was examined for Epstein-Barr virus, parovirus CM virus with no signs of active disease. A blood smear showed no signs of leukemia. The patient was vaccinated with second dose of GARDASIL (batch number NJ50800, lot number 0773x, route and site of administration not reported) on an unspecified date in 2009. No adverse events were reported. The patient was vaccinated with first dose of GARDASIL (batch number NJ38950, lot number 0747X, route and site of administration not reported) on 19-JAN-2009. No adverse events reported. At the time of the report, the patient was recovering from idiopathic thrombocytopenia purpura (thrombocyte count was normalizing) and was treated on an outpatient basis. The patient did not suffer from any disease at the time of vaccination. Other business partner numbers included: E2009-08754. Additional information has been requested.

Seriousness: ER VISIT, LIFE THREATENING, SERIOUS

MedDRA PT Bacterial infection, Blindness unilateral, Iritis, Migraine, Ocular hyperaemia, Photophobia, Ulcerative keratitis

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. An 18 year old female with no known medical history, she has been extremely healthy all her life and eats well and exercises daily, was vaccinated with a third dose of GARDASIL (lot# 663452/0671Y) in the right arm (route not reported) on 05-AUG-2009. Concomitant therapy included "birth control' (therapy unspecified) and tuberculin purified protein derivative (PPD) was administered on 05-AUG-2009. Since receiving the GARDASIL vaccination, the patient has suffered frequent migraine headaches, bloodshot eyes, and extreme sensitivity to light. Within a week or two of the third and final vaccination, eyes became extremely bloodshot. On 18-SEP-2009, the patient visit to team doctor for bloodshot eyes resulted in diagnosis of inflamed iris and two spots on the cornea. On 19-SEP-2009, when patient woke up in the morning, she was unable to see out of the left eye. She was taken to emergency room and was diagnosed with corneal ulcer and bacterial infection. She has been referred to cornea specialists for treatment. Treatment for past 9 days has involved hourly eyedrops and/or ointments applied to the eye, 24 hours a day. Doctor now concerned about thinning of cells and the surface of the eye being broken as a result of the bacteria attacking the cornea. These events have had an adverse number of effects on her life in addition to the medical concerns. Corneal ulcer and unknown bacterial infection caused loss of sight in left eye. The listing indicated that one or more of the events was considered to be immediately life-threatening. The originally reporting source was not provided. The VAER ID# is 358417. No further information is available. A standard lot check investigation was performed. All in-process quality checks for the lot number in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all re

Symptom Text: Currently 16 years old, did received three GARDASIL shots, the first one being in February 21st of 2008, second being April 24 th of 2008, and the third one being February 19th of t2009. The patient has had some previous with abdominal pain and a headache for which she was seeing Neurology and Gastroenterology. After her GARDASIL shot on February 21, 2008, the patient had an episode February 27th having emotional due to a boyfriend problems, did take a knife and made some small cuts in her wrists. Seen through the emergency room and thought to be stable, sent home and was being followed by a counselor in April of 2008. It was thought that she might benefit from some antidepressant medication and was started on Zoloft 25mg once a day. The patient was seen later, had her Zoloft increased to 50mg once a day. She did receive a second GARDASIL shot on April 24,2008 . The patient continued on the Zoloft for a few months and it was subsequently self-discontinued. For the most part, the patient did well over the ensuing next 12 months until April 23, 2009, when she was in a car accident, for which she had a CT scan of her abdomen, which did not reveal any abnormalities from the car accident, but did reveal ovarian and fallopian tube abnormalities thought to be consistent with pelvic inflammatory disease and was admitted to Hospital for antibiotics and was also seen by GYN. Also noted to have some mild kidney abnormality of uncertain significance. Nephrology just recommended follow up ultrasound. The patient did well for a while, then started having some more abdominal pain with some blood in her stools. She had previously seen Gastroenterology who had planned on giving her endoscopy and colonoscopy. If she had problems, started back on some Mira lax and Prevacid. A follow up appointment with Gastroenterology was scheduled. In the interim, the patient also had a laparoscopy by GYN in May, now waiting for a return visit to Gastroenterology. The patient started having more abdominal problems and dizziness, was admitted to t

MedDRA PT Convulsion, Muscle contractions involuntary, Vaccine positive rechallenge

Symptom Text: Information has been received from a consumer concerning his 21 year old daughter with TEGRETOL allergy who in May 2007, was vaccinated with the first dose of GARDASIL (lot number not reported). Two months later, in approximately July 2007, the patient experienced her first seizure. On an unspecified date the patient was vaccinated with the second dose of GARDASIL (lot number not reported). Two months after the second dose the patient experienced another seizure. On an unspecified date the patient was vaccinated with the third dose of GARDASIL (lot number not reported). After the third dose, the patient still experienced seizures. It was reported that "at one point, she was taken to the emergency room because her roommates were worried about her" and "most recently the left side of her body has been locking up and contracting, and last night (20-SEP-2009) it spread to her right side". There were some office visits. Unspecified lab studies performed, and no result provided. At the time of the report, the patient not recovered. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested.

Seriousness: ER VISIT, HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Chest pain, Dizziness, Dyspnoea, Pulmonary embolism, Urinary tract infection

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 23 year old female with a history of appendicectomy and previous smoker was vaccinated with the first dose of GARDASIL in May 2008 and was vaccinated with the second dose of GARDASIL (lot # 0294Y) in left arm on 28-MAY-2009. Concomitant therapy included NUVARING. On 14-JUL-2009 the patient experienced chest pain, dizziness, dyspnoea, pulmonary embolism and urinary tract infection and was hospitalized. Hospital records was received for dates 14-JUL-2009 to 21-JUL-2009. Coumadin/CT scan showed bilateral pulmonary embolism. D-dimer was 844, electrocardiogram (EKG) was abnormal, cardiac echo was within normal limits, chest X-ray (-), troponin was within normal limits, urinalysis test (+) white blood cell count (+) blood, whole blood hematocrit was 34L and platelets was within normal limits. The diagnosis was bilateral pulmonary embolism and urinary tract infection. The symptoms were chest pain for 1 week, shortness of breath, lightheadedness, "almost fainting" feeling. Assessment: relatively normal would perform lab/diagnostics. The patient had desk job and 2 short flights within past week. Patient was treated with anticoagulation therapy and discharged. Chest pain, dizziness, dyspnoea, pulmonary embolism and urinary tract infection were considered to be immediately life-threatening. No further information is available. A standard lot check investigation has been finalized. All in-process quality checks for the lot number in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the Center and was released. The original reporting source was not provided. The VAERS ID # is 358630.

MedDRA PT Convulsion, Loss of consciousness, Muscle rigidity, Syncope

Symptom Text: Initial and follow-up information has been received from a registered nurse concerning a 19 year old female patient who on 10-JUN-2009 was vaccinated with the first 0.5 ml dose of GARDASIL (lot# 661531/1311X) intramuscularly in the left arm. Concomitant vaccinations administered on 10-JUN-2009 included a dose of ADACEL (manufacturer Sanofi, lot# C2995AA) in the left arm and a dose of MENACTRA (Sanofi Pasteur, lot# U2640AA) in the right arm. Within three to five minutes the patient had syncope with a loss of consciousness and had rigidity of posture which lasted for about ten minutes, which was also described as a seizure. The patient regained consciousness and recovered without any medical interventions. The patient was ordered a follow-up EEG. The patient's mother declined a follow-up EEG test for her daughter. The patient left the physician's office with her mother. The patient will not receive the second dose of GARDASIL. Upon internal review, possible seizure was determined to be an other important medical event. Additional information has been requested.

Seriousness: LIFE THREATENING, SERIOUS

MedDRA PT Deep vein thrombosis, Pain in extremity

Symptom Text: Information has been received from a Health Authority (HA reference number 2009-03713) concerning a 15-year-old female with who on 17-AUG-2009 was vaccinated intramuscularly with her first dose of GARDASIL (lot number and batch number not reported). On 27-AUG-2009, ten days after vaccination, the patient developed searing pain in her left calf. This was the first time she had experience such an episode. A slight improvement followed before a worsening of symptoms, starting on 29-AUG-2009. A venous Duplex sonography was performed on 01-SEP-2009. Deep vein thrombosis of the lower leg was diagnosed. The patient was being treated with SINTROM. The therapy was planned for three months. The patient was not hospitalized. There was no known risk factors (obesity, oral contraceptives, smoking or pregnancy). An evaluation for possible hypercoagulability conditions was planned after the course of anticoagulant therapy The reporting physician planned to give the second dose of GARDASIL while the patient was still taking SINTROM. At the time of the report, she had not fully recovered. It was noted that the Health Authority assessed the causal relationship between thrombosis venous deep and GARDASIL as possible. Other business partner numbers included: E2009-08871. Additional information has been requested.

MedDRA PT Activities of daily living impaired

Symptom Text: Information has been received from a consumer via internet blog concerning her 13 year old daughter who was vaccinated with a dose of GARDASIL. According with the patient's mother, the patient was completely disabled for the past year in 2008. The reporter indicated that because of GARDASIL, her daughter was "one less student", "one less active child", "one less in every aspect o her life". The reporter also stated that she spent the last year sitting by her child's bedside wondering if she would "die in her sleep". The reporter also indicated that "this vaccine has cost my daughter a year of her life and tens of thousands in medical bills". The patient sought medical attention through a physician. The patient's outcome is unknown. Attempts to verify the existence of an identifiable patient have been unsuccessful. No further information is available. The patient was being treated in two hospitals.

MedDRA PT Activities of daily living impaired, Alopecia, Asthenia, Back pain, Chest pain, Computerised tomogram normal, Diarrhoea, Dizziness, Dyskinesia, Dyspnoea, Feeling abnormal, Gastric disorder, Headache, Heart rate increased, Hypoaesthesia, Malaise, Nausea, Neck pain, Pain, Paraesthesia, Visual impairment, Weight decreased

Symptom Text: Information has been received from the patient's mother via internet. The mother stated that her 16 year old daughter was injured by GARDASIL. On 09-JAN-2009, the patient was vaccinated with the first dose of GARDASIL and on 09-MAR-2008 with the second dose of GARDASIL. Before GARDASIL, she was happy, healthy and vibrant teenager. Since GARDASIL, the patient was sick every day of her life. She had dizziness, overall weakness, numbness and tingling in both legs and left arm, back pain, neck pain, pressure headaches, vision problems, breathing problems, chest pains, racing heartbeats, brain fog, stomach problems, nausea, diarrhea, weight loss, hair loss, jerking all over spells, the list goes on. She was and a/B student but failed her 10th grade year because she was too sick to retain what she was trying to learn (brain fog). she was no longer had energy to go off with her friends. Most days she lays in bed, in pain. The patient had been in the emergency room twice, once by ambulance for stopping breathing 3 times. She was seen several doctors. She had CT scan done. All tests come back normal (which is typical with all of the injured GARDASIL vaccine girls). Her blood panel showed high on immunoglobulin E (131H) and Anti streptolysin O (208H) which the doctor "thought" was rheumatic fever. Another doctor had said he did not believe she had rheumatic fever. Brain fog and energy increased were considered to be disability. This is one of several reports provided by the same source. No further information is available.

MedDRA PT Chills, Diarrhoea, Drug eruption, Hypersensitivity, Injection site erythema, Injection site inflammation, Injection site pain, Injection site swelling, Injection site warmth, Malaise, No reaction on previous exposure to drug, Pyrexia, Vomiting

Symptom Text: Information has been received from a physician via CSL as part of a business agreement (manufacturer control # 20090901JV1) concerning a 21 year old female who on 04-AUG-2009 was vaccinated with the third dose of GARDASIL. The patient experienced "massive local swelling at the injection site, intense fever and vomiting on the afternoon of receiving the third dose of GARDASIL (from 04-AUG-2009 to 10-AUG-2009). She saw the physician the next day and was admitted to the hospital the following day (06-AUG-2009). She "had a drip put in" and was discharged on 10-AUG-2009 after blood cultures were taken. Hospital notes stated "severe allergic reaction". Follow up information was received from the physician via discharge referral which reported that the patient with bipolar who on 04-AUG-2009 at 11:30 AM was intramuscularly vaccinated with the third dose of GARDASIL (lot# 663751/1574X, which was the lot # of PNEUMOVAX in her left deltoid. Within 2 hours of injection, the patient had a reaction at around the injection site, erythematous, raised skin, clear margin, warm to touch, 6 cm diameter and radial nerve intact. There was no prior reaction to other GARDASIL injection. No other vaccination given at the same time. The patient had been vomiting and injection site was red inflamed and painful. GP saw the patient on 06-AUG-2009 and gave her oral cephalexin. The patient took paracetamol at 12:00 PM on 06-AUG-2009. The patient presented to ED as increasingly unwell that afternoon. The patient presented with fever, rigors, vomiting, diarrhea and drug rash on her left shoulder. Her temperature was 37 C at triage. The patient was admitted on 06-AUG-2009. The patient recovered entirely with time and I.V. antibiotics and was discharged on 10-AUG-2009. The medications on discharge was dicloxacillin, quetiapine fumarate and sodium valproate. The physician felt that there was a reasonable possibility that the AE's were caused by the GARDASIL vaccine. The correct clock start date for the information containing the validated lot # i

MedDRA PT Alopecia, Amnesia, Arthralgia, Back pain, Chest pain, Condition aggravated, Confusional state, Convulsion, Fatigue, Irritability, Malaise, Migraine, Nervous system disorder, Staphylococcal infection, Transient ischaemic attack, Weight increased

Symptom Text: Information has been received from a consumer via and internet blog concerning her daughter a student with a history of occasional migraine and pharyngitis streptococcal when younger who in September 2007, was vaccinated with the first dose of GARDASIL (Lot number not reported) and received her second dose of GARDASIL (Lot number not reported) in November 2007. Subsequently on an unspecified date the mother reported that GARDASIL made her daughter sick. It had attacked her daughter's central nervous system. The student now spent most of days confused, irritable, trying to find her past as she can not remember a lot of it. She was an honor student and just graduated in May and could not remember her graduation. She suffered with re-occuring Methicillin-resistant staphylococcal aureus infection (MRSA), chronic fatigue, migraines, hair loss, chest and back pain, weight gain, joint pain, seizures and mini strokes. The reporter stated that her daughter is trying to get her life back and she wont received the third dose of GARDASIL as she realized this was indeed what made her sick. It was unknown if the patient sought medical attention. At the time of the report, the patient's outcome was unknown. Seizures were considered to be an other important medical event. The reporter felt that her daughter symptoms were related to therapy with GARDASIL. Attempts to verify the existence of an identifiable patient and reporter have been unsuccessful. No further information is available.

MedDRA PT Monoclonal immunoglobulin present

Symptom Text: Information has been received from a physician concerning a 22 year old female who in April 2009, was vaccinated with the first dose of GARDASIL. In June 2009 the patient was vaccinated with the second dose of GARDASIL. Concomitant therapy included tick-borne encephalitis virus vaccine (FSME IMMUN) (first dose in March 2009 and the second dose in May 2009). In June 2009, the patient experienced monoclonal protein in blood serum. The patient was hospitalized probably in June 2009 (reason not reported) and laboratory tests performed during hospitalization revealed presence of monoclonal protein in blood serum. The patient's monoclonal protein in blood serum persisted. The patient was discharged from hospital and stayed at home. The physician was not sure if monoclonal protein in blood serum was related to therapy with GARDASIL. The tick-borne encephalitis virus vaccine (FSME IMMUN) was considered to be the secondary suspect therapy. The monoclonal protein in blood serum was considered to be an other important medical event by the physician. Additional information is not expected.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Caesarean section, Drug exposure during pregnancy, Neonatal disorder

Symptom Text: Information has been received from Merck Pregnancy Registry for GARDASIL from a physician concerning a 15 year old female patient who on 27-MAR-2009 was vaccinated with a first dose of GARDASIL (lot # 659655/0940X). On 27-MAY-2009 she received second dose of GARDASIL (lot # 662229/1497X). On an unspecified date the patient became pregnant. Follow up information has been received from a physician concerning the 15 year old female patient with a vaccination history that included five doses of DTaP (manufacturer unknown) on 07-FEB-1994, 07-SEP-1994, 21-JUN-1994, 30-JUN-1995, 25-AUG-1998. A dose of DTaP (Lot number C2556AA) at 12 year old 18-JUL-2006. Three doses of HIB (OMPC) (manufacturer unknown) on 07-FEB-1994, 21-JUN-1994, 30-JUN-1995. Three doses of ENGERIX-B on 18-JUL-2006 (Lot number B256AA), 29-DEC-2006 (Lot number B258AA) and on 01-MAY-2007 (Lot number B319AA). Four doses of POLIO (unspecified) (manufacturer unknown) on 07-FEB-1994, 07-APR-1994, 30-JUN-1995 and on 25-AUG-1998. Two doses of MMR (manufacturer unknown) on 30-JUN-1995 and on 25-AUG-1998. A dose of VARIVAX (Merck) (manufacturer unknown) on 25-AUG-1998. On 27-MAR-2009 the patient was vaccinated with the first dose of GARDASIL and on 27-MAY-2009 received the second dose of GARDASIL. The physician reported that the patient delivered a baby boy by c-section on 07-SEP-2009. On 07-SEP-2009 the patient was born with genetic hypospadias at 34 weeks and weight at birth of 2280 grams. The physician added that discussion with the baby's parents have been made and this condition may be corrected when the baby is 1 year of age. The physician reported that both the mother and the baby are doing well. Upon internal review genetic hypospadias was considered as genetic anomaly and delivered a baby boy by c-section to be as other important medical event. No further information is available.

MedDRA PT Amnesia, Confusional state, Convulsion, Cyanosis, Dyskinesia, Fall, No reaction on previous exposure to drug, Tongue biting, Tongue oedema, Tremor

Symptom Text: Information has been received from a physician and the physician's secretary concerning a 14 year old female patient with no known drug allergies, pertinent medical history or concurrent conditions who on 21-JUL-2009 was vaccinated with the first dose of GARDASIL (Lot # 658271/0558X). The patient did not have any reaction after the first vaccination. On 21-SEP-2009 the patient was vaccinated with the second dose of GARDASIL (lot # 658271/0558X). There was no concomitant therapy and no other vaccines were given on those days. 24 hours after the second vaccination (22-SEP-2009) the patient had a seizure. The patient's mother contact an " Emergency Medical Tech" who informed her it was from the GARDASIL but the patient was not taken to the hospital. The patient was last seen in the office 23-SEP-2009. At the time of the report, the patient's seizure was recovering. The physician had ordered an EEG and recommended the patient to be seen by a pediatric neurologist (name not recorded). Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested. 10/6/09 PCP medical records, consultations, service date 9/23/09. Assessment: First time seizure. Patient presents with hx of right arm jerking, fell to floor, body shaking, turned grey/blue, biting tongue, vomiting. Tongue edematous. Followed by another shaking episode. Does not remember episodes. Patient remains confused.

Other Meds: None

Lab Data: Unknown. 10/6/09 PCP medical records, consultations, service date 9/23/09. LABS and DIAGNOSTICS: EEG - Abnormal. CBC - Platelets 482 thou/cmm (H) Monocytes 9% (H). CHEM - AST 90 U/L (H) ALT 118 U/L (H) BUN mg/dl (L). MRI Brain - Normal.

History: None. 10/6/09 PCP medical records, consultations, service date 9/23/09. When going to sleep bilateral jerks of legs. At times jerking of right arm.

MedDRA PT Dissociative disorder, Quadriparesis

Symptom Text: Information has been received from a health authority under HA reference no. PEI2009020113 concerning a 14 year old female who on 19-MAY-2009 was vaccinated with the first dose of GARDASIL. On 04-AUG-2009 the patient received the second dose of GARDASIL (IM, lot # 1285U, batch # NH24920) into the upper arm. On 24 -AUG-2009 the patient developed a dissociative disorder tetraparesis. The patient was hospitalized for an unspecified time. Several investigations were carried out (including lumbar puncture, EEG, nerve conduction studies, cranial and spinal MRI, blood analysis, neurological and psychological examination) and showed no pathological findings. Psychological examination supported the diagnosis. Organic causes as GUILLAIN-BARRE syndrome, diseases of central and peripheral nerve system that cause paresis and muscle disease were ruled out. At the time of reporting (03-SEP-2009) symptoms had notably improved. File closed. Other business partner numbers include E2009-08894.

MedDRA PT Condition aggravated, Conversion disorder, Convulsion, Malaise

Symptom Text: Patient received Gardasil vaccine dose #1 on 3/2/2009, Gardasil #2 on 6/9/2009, and Gardasil #3 on 9/30/2009. She reports having a seizure in May, was seen by a neurologist and had a negative workup, and was told she has pseudoseizures and was prescribed Xanax 0.25 mg. She reports her last seizure was 9/2/2009. Approximately 5 minutes after receiving her third Gardasil dose today at 2:15 PM, she complained of "not feeling well" and then began to have a seizure that lasted approximately 5 minutes in duration. She took 0.25 mg of Xanax at the onset of the seizure. She did not suffer any injuries during the seizure and was awake, alert, and responsive during the event. She was ambulatory upon leaving the office and had no complaints. She did admit to not having eaten either breakfast or lunch today.

Other Meds: Prozac, Xanax

Lab Data: none

History: Patient did not state that she has pseudoseizures until after the Gardasil vaccine was administered. She reports a previous diagnosis of ADHD.

Prex Illness: pseudoseizures

MedDRA PT Chest discomfort, Cough, Deep vein thrombosis, Dyspnoea, Intensive care, Pain in extremity, Pulmonary embolism, Thrombolysis

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 25 year old female with no known drug allergy and a history of factor v Leiden heterozygote disease, deep vein thrombosis 18 months prior, pregnancy (no medications for anti-coagulation prior to pregnancy) and postpartum who on 02-JUN-2009 was vaccinated intramuscularly in left arm with the second dose of GARDASIL (LOT# 660389/1968U). Concomitant therapy included subcutaneous heparin secondary to post-partum. On 07-JUN-2009 the patient had symptoms of leg pain. On 12-JUN-2009, 10 days post vaccination, the patient was hospitalized with extensive deep vein thrombosis and bilateral pulmonary embolism. The patient required thrombolysis with total parenteral alimentation (TPA), intraventricular catheter (IVC) filter placement, echocardiogram and computerized tomogram (CT scans) with the positive result for bilateral pulmonary embolism. Laboratory tests and diagnosis studies were done. Doppler ultrasound in right leg had a positive result for deep vein thrombosis; complete blood cell count (CBC) and "CMP" were within normal limit; troponin was high at 0.44; prothrombin time (PT) and activated partial thromboplastin time (APTT) were elevated; oxygen saturation test was low with 70's; and electrocardiogram (EKG) was normal. The patient stayed in intensive care unit and was prescribed anti-coagulation with COUMADIN for 6 months. On 16-OCT-2009 hospital records for dates of 12-JUN-2009 to 15-JUN-2009 were received. It was reported that the patient also presented with signs of dyspnoea, cough, chest tightness and right leg pain after 10 days of vaccination. The patient treated with IV heparin, subcutaneous LOVENOX and IVC filter placement. Chest discomfort, computerized tomogram, cough, deep vein thrombosis, dyspnoea, echocardiogram, intensive care, pain in extremity, pulmonary embolism and thrombolysis were considered to be immediately life-threatening. The patient required an emergency ro

MedDRA PT Bed rest, Femoral artery embolism, Intensive care, Pulmonary embolism

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 15 year old female with no previous illness or medical history who on 12-JUN-2009 was vaccinated with a second dose of GARDASIL intramuscularly into the left arm (lot # 659655/0940X), a first dose of HAVRIX intramuscularly into the right arm (lot # AHAVB330CA) and a first dose of VARIVAX (Merck) subcutaneously into the right arm (lot # 663759/0492Y). 84 days post the vaccination, on 04-SEP-2009 the patient experienced bed rest, femoral artery embolism, intensive care and pulmonary embolism and was hospitalized. It was reported that the patient developed emboli in lungs and in a large part of the femoral artery. The patient was hospitalized at a medical center and in intensive care unit for a number of days. It was reported that the patient was not treated at this facility. Diagnosis occurred by CT scan showing large femoral artery thrombosis on 08-SEP-2009. The patient was currently at home on strict bed rest and being monitored with COUMADIN therapy. The listing indicated that one or more of the events required hospitalization, extended hospital stay and was considered to be immediately life-threatening. No further information is available. The original reporter was not provided. The VAERS ID # is 358985. A standard lot check investigation for VARIVAX (Merck) (lot # 663759/0492Y) was finalized. All in-process quality checks for the lot number (lot # 663759/0492Y) in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot (VARIVAX (Merck), lot # 663759/0492Y) met the requirements of the Agency and was released.

MedDRA PT Concussion, Convulsion, Fall, No reaction on previous exposure to drug, Syncope

Symptom Text: Information has been received from a gynaecologist concerning a 13 year old female patient who was vaccinated with the second dose of GARDASIL (Lot number 1285U and Batch number NH35150) IM into the left upper arm on 28-AUG-2009. The same day the patient developed syncope and "seizure symptoms" for 3 minutes. The patient felt down on the back of the head and experienced a commoti cerebri. The patient was hospitalized for observation (duration not reported). The patient recovered. The first dose of GARDASIL, administered in July 2009, was well tolerated. CASE IS CLOSED. Other business partner numbers included: E2009-08791.

MedDRA PT Activities of daily living impaired, Autoimmune thyroiditis, Blood test, Infectious mononucleosis, Streptococcal infection, Swelling, Weight increased

Symptom Text: Information has been received from the parents concerning their daughter, an 18 year old female patient with no pertinent medical history and drug reactions/allergies who intramuscularly received the first 0.5ml dose of GARDASIL (lot#660557/0072X) on 10-JUL-2008 and the second dose (lot#661531/1311X) on 22-DEC-2008. Concomitant therapy included SYNTHROID and CYTOMEL. It was reported that the first vaccination was given concomitantly with meningitis vaccine (manufacturer unknown). In February 2009, the patient has had 3 strep infections. On 10-APR-2009, the patient developed chronic mononucleosis. It was also reported that in approximately April 2009, the patient started "swelling up, developed hashimoto's thyroiditis, she has also gained 35-40 pounds". The patient has not been able to return to school this year. The patient's father reported that the patient was a "college athlete". The patient had sought unspecified medical attention. Unspecified blood work has been performed, but the result was not reported. At the time of the report, the patient was recovering. Swelling up, chronic mononucleosis, hashimoto's thyroiditis and 3 strep infections were considered to be disabling. A lot check has been initiated. Additional information has been requested.

MedDRA PT Gait disturbance

Symptom Text: Information has been received from a physician who "heard from a patient that someone related to her friend", a female, who was vaccinated with her second dose GARDASIL on an unspecified date. Subsequently the patient required assistance in walking. The patient might have been treated at a hospital. At the time of the report, the patient's status was unknown. Follow up information on 25-SEP-2009 has been received through a phone call from a physician. The physician stated that she did not know any information of the patient. She would ask the person who report the case to get the patient's adverse experience. Required assistance in walking was considered to be disabling. The Health Care Professional contacted during telephone follow-up could not supply the following information: patient name, date of birth, dates of vaccination/therapy, dose number (if applicable), lot number, date of event, recovery status, hospital name (if applicable), healthcare provider name and contact information. No further information is available at this time. Additional information has been requested.

MedDRA PT Facial bones fracture, Fall, No reaction on previous exposure to drug, Syncope, Tonic clonic movements

Symptom Text: Information has been received from a Registered Nurse (R.N.) concerning a 11 year old female who on 21-SEP-2009 experienced a syncopal episode with tonic-clonic movements after receiving her second dose of GARDASIL (lot# 0216Y). It was reported that when she fell during this episode she fractured her nose. The patient sought medical attention and was seen by the nurse. X-rays of nose indicated fractured nose. The outcome was unknown. Follow up information was received from a Licensed Practical Nurse (L.P.N.) on 24-SEP-2009 via telephone reported that the patient with no pertinent medical history and allergic to AUGMENTIN (hives) was vaccinated with her second dose of GARDASIL (lot#0216Y) on 21-SEP-2009. No other vaccines and concomitant therapies were given that day. After fall, the patient was not sent to emergency room but for an x-ray of the nose and a CT of the head. Both revealed a nasal fracture. The patient's current status was recovering. She was referred to an ENT (name not provided) and surgery was planned. It was also reported that the patient was given the first dose of GARDASIL (lot# 662300/0100Y) in the left arm on 15-JUL-2009. Other vaccines given on that day included a dose of MENACTRA (lot# U2925AA) and a dose of VARIVAX (Oka) (lot# 0690Y). There was no problem after the first dose of GARDASIL. The reporter considered the fractured nose to be disabling. Additional information has been requested.

MedDRA PT Complex regional pain syndrome, Muscular weakness, Pain

Symptom Text: Initial report was received 12 October 2009 from another manufacturer, report number WAES 0909USA04030. The initial reporter to this manufacturer had been a health care professional. This manufacturer also received follow-up information from a registered nurse, and the patient's mother. Verbatim from the report: "Information has been received from a physician concerning a 16 or 17 year old female who was vaccinated with a dose of GARDASIL. Subsequently the patient experienced reflex sympathic dystrophy within 1 day of administration of the vaccine. The patient was hospitalized for 1 month. The name of the hospital, dates of hospitalization, or patient specific information was not available. At the reporting time the patient had not recovered. Follow up information was received from the patient's mother and a registered nurse, the patient's mother reported the patient's date of birth and stated that the patient had no known drug allergies and had no significant medical history prior to the GARDASIL injection and was on no concomitant medications at the time of vaccination. The mother also stated that her daughter started to experience symptoms on 01-OCT-2007 and on 11-OCT-2007 she was diagnosed with reflex sympathic dystrophy and was hospitalized for 10 days as an inpatient. Upon her discharge the patient was treated with outpatient therapy (PT) from 8 am to 5 pm daily for left lower extremity weakness and pain associated with the reflex sympathic dystrophy. The patient's symptoms had not fully resolved, as the mother reported that she has "manageable flare-ups" which require PT and/or time at the gym, have occurred off and on since her disease onset to as recently as this school year. The registered nurse reported that GARDASIL was given on 10-AUG-2007 (Lot # 658282 / 0929U). The patient also received MENACTRA on the same date. The NP who is also the patient's mother noted that she was unsure of GARDASIL association with her daughter's experiences and will not have her daughter complete the series. Reflex sympath

MedDRA PT Facial palsy

Symptom Text: Case received from a physician on 22-SEP-2009 and additional information received on 24-SEP-2009. Information has been received from a physician concerning a 14 year old female patient with no relevant medical history except for classical infantile diseases who on 25-MAY-2009 was vaccinated with the first dose of GARDASIL (lot#, route and site of administration not reported). On 06-JUN-2009, she experienced a probable "a frigore" facial paralysis, with a massive motor deficit of the hemiface (the side was not specified). The patient consulted at the Emergency Unit Care. She was seen by the otorhinolaryngology service. No etiology was found. She recovered within one month. On 24-SEP-2009, it was confirmed that she had experienced a peripheral facial paralysis. Treatment was unknown. She recovered without sequelae. Facial paralysis was considered to be an other important medical event. Other business partner numbers included: E2009-08880. No further information expected.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain, Diarrhoea, Epilepsy, Feeling of body temperature change, Headache, Myalgia, Nuclear magnetic resonance imaging normal, Postural orthostatic tachycardia syndrome, Somnolence, Unresponsive to stimuli

Symptom Text: Case received from a foreign health authority on 22-SEP-2009 under health reference no. PEI2009020328. It was reported that an at least a 16 year old (also reported as 15 year old) female patient with a disposition to orthostatic hypotension since years, was vaccinated with an unspecified dose of GARDASIL (lot number, injection site and route not reported) on an undefined date in 2007. Concomitant therapy included hormonal contraceptives (unspecified). About 2 or 3 weeks post vaccination the patient developed relapsing abdominal cramps following the same pattern: abdomen tensed and was very painful. She felt hot and cold and was unresponsive to stimuli with progression. Symptoms lasted for about 30 to 45 minutes respectively. Afterwards the patient was very sleepy. The following days the patient developed abdominal muscle ache, mild headache and diarrhea. On 11-AUG-2009 the patient was hospitalized due to increasing frequency (up to twice a month). Physical and neurological examination showed no pathological findings. Electrocardiography (EEG) on 11-AUG-2009 under hyperventilation showed intermittent bifrontotemporal focal retardation with repeating spikes on both frontal sides with changing emphasized sides. EEG after sleep deprivation on 12-AUG-2009 showed dysrhythmic groups, starting from frontal right, then generalized with spikes also frontal right. A cranial Magnetic Resonance Imaging had been previously carried out and was without pathological findings. Because of typically course of symptoms the patient was diagnosed with epilepsy with complex focal seizures. Treatment with lamotrigine was started. A Schellog test was carried out and showed a mild postural tachycardia syndrome. A blood sample (routine laboratory) was taken on 12-AUG-2009 and showed normal results except for C-reactive protein (6.5 mg/L; normal values 0.1-5.0). Upon reporting from dated 21-AUG-2009 the patient had not recovered at the time of reporting. The reporter assessed a possible temporal coincidence between vaccination and beginning

Other Meds: hormonal contraceptives (unspecified)

Lab Data: electroencephalography, 11Aug09, intermittent bifrontotemporal focal retardation with repeating spikes on both frontal sides; electroencephalography, 12Aug09, EEG after sleep deprivation on 12-AUG-2009 showed dysrhythmic groups; serum C-rea

MedDRA PT Condition aggravated, Electrocardiogram normal, Immediate post-injection reaction, Loss of consciousness, Neurological examination normal, Syncope, Tonic clonic movements

Symptom Text: Initial information was received on 24-AUG-2009 by the Foreign health Authority (Reference number ES-AGEMED-220130444) regarding a 14 year old female who was administered on 28-AUG-2009 a dose of GARDASIL (lot number, injection site and not reported) by intramuscular route. On the same date the patient also received a dose of DITANRIX by intramuscular route, site not reported. Immediately after vaccine administration with GARDASIL and DITANRIX, the patient presented vasovagal syncope with loss of consciousness that lasted for one minute, also the patient presented orofacial tonic clonic movements which lasted a few seconds. The patient recovered spontaneously that same day, 28-AUG-2009. Neurologic exploration, glucemic exploration and electrocardiogram were all normal. The patient has a medical history of syncopes without loss of consciousness. Case reported as serious by the health authority with other medically important condition as criteria. Other business partner numbers include E200908954.

MedDRA PT Confusional state, Dizziness, Gait disturbance, Headache, Immediate post-injection reaction, Nausea, Pallor, Posture abnormal, Vaccination complication, Vision blurred

Symptom Text: GARDASIL first shot - immediately after receiving shot, patient turned grey. Within half an hour of receiving the shot, patient was dizzy, confused, light headed, severely nauseous, reported blurry vision, had gait dysfunction, appeared "stoned", and was unable to hold her head up straight. This continued throughout the day -shot was administered at 11:30am-. Primary doctor was contacted and indicated this was and adverse reaction to the GARDASIL shot. At approx 5pm - I - the patient's mother- decided it was time to to to the ER. Took patient to ER, diagnosis of adverse vaccine reaction was confirmed, manufacturer was contacted -merck-, and ER doctor confirmed with Merck that generally these reactions do not progress beyond the point where patient was in reaction. Patient was released after observation of vitals and neurological responses. 10/6/09 ER records received for 9/28/09. DC DX: Vaccine reaction, Dizziness, HA. Presenting SX: pt went to ER with c/o dizziness, headache, blurred vision after gardasil vaccine same day. Assessment: onset of dizziness 8 hours prior to ER, at time of ER visit sx improving. Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Dizziness, Epistaxis, Fatigue, Headache, Malaise, Musculoskeletal chest pain, Oropharyngeal pain, Paraesthesia, Presyncope

Symptom Text: Information has been received from a health professional concerning a 12 year old female patient who on 03-SEP-2009 was vaccinated with a dose of GARDASIL. Secondary suspect vaccine given on the same day included RECOMBIVAX HB. It was reported that the patient developed "non stop nose bleeding" on the day of vaccination, 03-SEP-2009. It was reported that the patient had not recovered at the time of reporting. Additional information has been received from a nurse concerning a 12 year old female patient who on an unspecified date was vaccinated with the first dose of GARDASIL and the first dose of RECOMBIVAX HB, the patient experienced a vaso-vagal episode. After the second dose of GARDASIL the patient had no adverse event. 03-SEP-2009 the patient was vaccinated with the third dose of GARDASIL (lot number: NJ29430, Batch number: NJ20450) intramuscularly in the left arm and the second dose of RECOMBIVAX HB (lot number, 1422U, Batch number: NJ11300) intramuscularly in the left arm at approximately 10:00 am at school. On the same day after vaccination, the patient had a nose bleed 2 hours after immunization. The nose bleed took 20 minutes to stop. The patient also complained of "tingling" sensation in her left arm all day. The "tingling" sensation continued until the next day when it resolved with no treatment. The patient also complained of headache, dizziness and fatigue, the patient had another nosebleed over night 14 hours later from vaccination, which took 20 minutes to stop. On the next day the patient still felt unwell, stayed home from school. The patient also complained of sore ribs and sore throat. The patient was taken to her general practitioner on 04-SEP-2009 at 1:00 pm. The general practitioner believed the patient's symptoms were unrelated to GARDASIL and RECOMBIVAX HB. The general practitioner concluded that the patient had a virus prior vaccination which resolved over 2-3 days following visit to general practitioner. The patient confirmed that she had felt unwell for the 2 days prior to immunization.

MedDRA PT Dyskinesia, Grand mal convulsion, Irritability, Limb discomfort, Loss of consciousness, Palpitations, Syncope, Tremor, Viral infection

Symptom Text: Information has been received from a consumer concerning her 15 year old female daughter with stomach surgery (when she was 5 years old), who at the end of June 2009 (approximately 30-JUN-2009) was vaccinated with the first dose of GARDASIL (Lot number not provided). There was no concomitant medication. The consumer reported that on approximately 30-JUN-2009 "within a minute of receiving the first dose of GARDASIL" the patient collapsed and her arms started jerking around. The patient was brought to the emergency room but she was not admitted. The patient went home the same day. The consumer reported that the patient had been experiencing shakes and heart palpitations for 3 to 4 weeks starting on approximately 02-SEP-2009. Therapy with GARDASIL was discontinued (date not specified). At the time of the report the patient had not recovered. The patient sought medical attention at the physician. Upon internal review collapsed and her arms started "jerking around" were determined to be an other important medical event. Additional information has been requested. 10/26/09 Medical records received for date 6/18/09. Pt c/ reaction after receiving varivax #2, and gardasil #1. c/o tonic clonic seizure after vaccine. bhp 12/29/2009 ER record received for DOS 06/18/2009. DX: Syncope Patient presented to ER feeling well with no weakness or sensory deficits. Patient reported that after receiving a vaccination, her arm was hurting. Upon receiving a second vaccination in her other arm, the patient passed out for twenty seconds with jerking movements in arms and legs. When patient came to, she was alert and not confused. Discharged home. 01/04/2010 hospital records and clinic notes received for DOS 11/22/1993-10/23/2009. DX: Fainting spells, Syncope following Gardasil, Viral Syndrome Clinic note of 06/18/2009 notes patient was observed in office post seizure and given glucose wafer because last meal was approximately 6 hours earlier. Clinic note of 09/23/09 notes complaint of fainting spells and plan/treatment no

MedDRA PT Urticaria aquagenic

Symptom Text: Information has been received from a physician via CSL as part of a business agreement (manufacturer control # 20090817JZ1) concerning a 13 year old female who on 13-NOV-2008 was vaccinated with her third dose of GARDASIL (lot number, route and site not reported). In the beginning of March 2009, the patient developed aquagenic urticaria, an allergy to water, which was ongoing. Additional information has been received from a physician concerning a 13 year old female patient who on 13-NOV-2008 (Also reported as October 2008) was vaccinated with the third dose of GARDASIL. No concomitant medication. On 20-MAR-2009, four months after vaccination, the patient developed a severe urticaria on contact to water (aquagenic urticaria). A normal blood screen was performed on 2009. At the time of reporting on 24-SEP-2009, the patient's aquagenic urticaria was slowly resolving. The physician considered aquagenic urticaria to be as other important medical event. Additional information is not expected.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abdominal pain, Asthma, Back pain, Drug exposure during pregnancy, Foetal disorder, Premature labour, Urinary tract infection

Symptom Text: Information has been received from a registered nurse concerning a 17 year old female with no known drug reactions/allergies and severe asthma who on 15-APR-2008 was vaccinated intramuscularly with the first dose of GARDASIL (Lot # 659964/1978U) and on 22-JAN-2009, was vaccinated intramuscularly with the second dose of GARDASIL (Lot # 661531/1311X). Concomitant therapy included ADVAIR, FLOVENT, Prednisone, Albuterol and Influenza virus vaccine (unspecified) (given on 22-JAN-2009). The registered nurse reported that the patient became pregnant after receiving the second dose of GARDASIL. She also stated the patient delivered the baby on 11-SEP-2009; however, the baby was born with hydrocephalus. The patient sought unspecified medical attention. On 01-OCT-2009, through a telephone call, the registered nurse reported that the mother and baby were being treated by the same physician. The mother was seen in the office on 22-JAN-2009 for an appointment. She was a severe asthmatic who had been on ADVAIR for years (exact therapy dates not provided) and ADVAIR was not controlling her asthmas as well as the physician would have liked. The patient was also noted to be a smoker. On 22-JAN-2009, the patient was switched to FLOVENT, Prednisone and Albuterol for asthma management. The patient was also given a flu vaccine (manufacturer not specified) and her second dose of GARDASIL. The registered nurse further noted that on that date (22-JAN-2009) the patient had a negative urine HCG test. It was estimated that the patient was actually 3 weeks, pregnant at the time of the urine pregnancy screen because she soon found out she was pregnant and her last menstrual period was estimated to have been around 02-JAN-2009. The reporter did not have the mother OB/Gyn contact information or any specific information surrounding her labor and delivery. She reported that she thought that the baby's hydrocephalus was diagnosed by ultrasound prior to his birth, but she did not have the baby's chart available at the moment to consult. She did re

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Intra-uterine death

Symptom Text: Initial and follow-up information has been received from Merck Pregnancy Registry for GARDASIL from a Nurse Practitioner concerning a 25 year old female patient with a history of 3 full term delivery pregnancies who on 03-DEC-2008 was vaccinated with a first dose of GARDASIL (lot # 661703/0651X) 0.5ml, intramuscularly. On 04-FEB-2009 she received second dose of GARDASIL (lot # 661954/1496X) 0.5ml, intramuscularly. There was no concomitant medication. The patient was pregnant. Pregnancy was discovered on test performed at the office before administering the third dose of GARDASIL when the patient reported missing a period. The patient had last menstrual period on 16-APR-2009. Estimate date of delivery is on 21-JAN-2010, but is subject to change with ultrasound schedule for the near future. On 16-JUL-2009, ultrasound was performed resulting 11 weeks and estimate date of delivery was changed to 04-FEB-2010. Follow up information has been received from a health care professional concerning a female patient with no concurrent medical conditions and no infections or illness during pregnancy who on12-SEP-2009 experienced a complication during pregnancy of fetal demise at 15 weeks. On an unspecified date serum alpha-fetoprotein test (AFP) was performed and showed increased risks of Down's. On 12-SEP-2009 (15 weeks from last menstrual period) the patient had spontaneous abortion (< 20 weeks) due to fetal demise. The patient did not have complication during labor/delivery. The products of conception were examined and were normal. The fetus was normal. Additional information is not expected.

Other Meds: None

Lab Data: ultrasound, 07/16/09, 11 weeks, CEDC 04-FEB-2010; beta-human chorionic, positive; serum alpha-fetoprotein, Showed increased risks of Down's

MedDRA PT Arthralgia, Asthenia, Crying, Dizziness, Dyspnoea, Dysstasia, Fatigue, Feeling abnormal, Headache, Hypoaesthesia, Hypokinesia, Injected limb mobility decreased, Injection site pain, Musculoskeletal pain, Myalgia, Nausea, Pain, Tenderness, Vaccine positive rechallenge, Vomiting

Symptom Text: Information has been received from a physician and a licensed practical nurse concerning a 13 year old female with no pertinent medical history or no known drug allergies, who on 24-SEP-2009 was vaccinated with 0.5 ml of the first dose of GARDASIL (Lot number 659655/1486U) intramuscularly on the right arm. On the same day the patient received a dose of hepatitis A vaccine (inactive) (AVENTIS) (Lot number: AHAVB291AA) on the right arm, a dose of VARIVAX (Lot number: 661334/0737X) on the right arm, MENACTRA (Lot number U2663AA) left arm. The patient became lightheaded, had pain at the injection site, was dizzy and experienced numbness on the right leg while still in the office after vaccination. the patient was told if the symptoms got worse, to call the office or go to the emergency room (ER). The patient continued to feel bad, vomited and felt weak so the patient went to the ER. The patient was hydrated and got better. The physician reported that the patient recovered maybe on 01-OCT-2008, reported as "1 week after the first dose of GARDASIL". On 25-SEP-2009, the patient was in the office for a well visit and received the second dose of GARDASIL (Lot number 662404/0312Y) on the left arm, a dose of influenza virus vaccine (unspecified) (Lot number: U3177AA) and a dose of hepatitis A virus vaccine inactivated (Lot number 663913/0206Y) on the right arm. The patient then experienced severe pain at the injection site on the left arm. The nurse put ice on the injection site because the pain was so extreme the patient was crying. The patient was told to call the office if the symptoms got worse. The patient went to the ER. The patient had no fever. The ER notes from 27-SEP-2009, at 17:30 stated that the patient started to feel, on 25-SEP-2009, lightheaded and complained of pain all over-severe myalgia. The patient had difficulty moving her left arm and left leg. The patient got better 26-SEP-2009, but symptoms got worse 27-SEP-2009 night. The patient had nausea, dizziness sometimes, tired, aches and pains all over the b

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Arthralgia, Autoimmune disorder, Back pain, Blindness, Depression, Eye operation, Eye pain, Fatigue, Glaucoma, Headache, Iridocyclitis, Juvenile arthritis, Ocular hyperaemia, Photosensitivity reaction, Uveitis, Vision blurred, Visual field defect, Weight increased, X-ray abnormal

Symptom Text: Information has been received from a consumer concerning her 13 year old daughter with no pertinent medical history reported and no known drug allergies who in May 2007, was vaccinated with first dose of GARDASIL (dose, route and lot number not reported). There was no concomitant medication. Sometime after receiving the first dose, the patient started complaining of joint pain of knees and back, fatigue and tiredness. Then, the patient received her second dose of GARDASIL (dose, route and lot number not reported) and in November 2007, she received her third dose of GARDASIL (dose, route and lot number not reported). A few weeks after receiving the first dose, the patient developed a full brown uveitis. The patient was given steroids (name and manufacturer unspecified) which she had a reaction to and now, the patient was legally blind, but she had some outpatient eye surgeries and developed glaucoma. The patient was taken to a Hospital to see a physician and they did blood work and X-rays of her knees and back (results not provided) and the patient was diagnosed with autoimmune disease. The patient's mother reported that the patient was put on infliximab (manufacturer unknown) and which did not help, and now was on HUMIRA which was helping her joint pain. The patient's joint pain on knees and back, fatigue and tiredness, full blown uveitis, legally blind, outpatient eye surgeries, glaucoma and autoimmune disease persisted. Follow up information was received from a registered nurse. She stated that the patient received the GARDASIL vaccinations on the following dates: the first dose was given on 03-MAY-2007 (Lot number 656051/0244U, route not reported), the second dose was given on 10-JUL-2007 (Lot number 657621/0387U, route not reported) and third dose was given on 15-NOV-2007 (Lot number 658560/1062U, route not reported). There were no concomitant vaccinations administered at the time the GARDASIL vaccinations were administered. The Registered nurse stated that there was no documentation that the patient had any

MedDRA PT Cell death, Cholestasis, Erythema, Face oedema, Localised oedema, Musculoskeletal pain, Oedema peripheral, Polyarteritis nodosa, Pyrexia, Skin lesion, Vasculitis

Symptom Text: Case received from the health authorities under the references numbers GR20090422 GR0901064: A 17 year old female patient received a dose of GARDASIL (lot number not reported) via intramuscular route on an unspecified date. On 12-APR-2009 the patient experienced pseudomembranous angina treated with cefixime 200 mg, DOLIPRANE, then amoxicillin and niflumic acid. On 20-MAY-2009 (reported by the health authorities as "36 days after" without further specification), the patient developed diffuse nodose and inflammatory lesions on the forearms, the external face of the right ankle and the left buttock. On 02-JUN-2009, she was hospitalized due to and oedema of the face and the neck, a periorbital erythema of "glasses" type, cutaneous lesions of the lower limbs, lesions "en cocarde" aspect, erythematous and oedematous right upper limb, diffuse arthromyalgias and fever at 39 C. Biological examinations showed polynucleosis at 34 g/L associated with normocytary anaemia at 105 g/l and an inflammatory syndrome (C- Reactive protein at 300 mg/l), cytolysis at 240 ASAT and 201 ASAT, and anicteric cholestasis (ALP at 250, GGT at 93 IU/l). Cutaneous biopsy performed on 03-JUN-2009 showed middle-sized blood vessel vascularitis, together with a necrosis of the vessel walls with fibrins deposit. Perivascular infiltrate with a predominance of neutrophil polynuclears was found, with rare eosinophils and a few lymphocytar elements. Periarteritis nodosa of musculocutaneous type was diagnosed. Differential diagnoses were as following: Infections pathologies (serologies for HIV, hepatitis B and C, Chlamydia, syphilis, brucellosis, lyme, trichinosis, cytomegalovirus, IgG positive for a former parvovirus B19, absence of IgM, bartonella and blood cultured negative). Autoimmune pathologies (antinuclear antibodies, antineutrophil cytoplasmic antibodies, rheumatoid factors negative, only C3 and C4 were increased). On 17-JUN-2009, the muscular pain had resolved. The patient progressively started walking again. Muscular pain receded under morphine

Other Meds: DOLIPRANE; Helicidine

Lab Data: Diagnostic laboratory test, ??Jun09, 34 g/L; Diagnostic laboratory test, ??Jun09, 240 ASAT and 201 ASAT; Skin biopsy, middle-sized blood vessel vascularitis, necrosis of the vessel walls with fibrins deposit; Body temp, 02Jun09, 39 C; Serum

MedDRA PT Convulsion, Dizziness, Heart rate irregular

Symptom Text: Information has been received from a health care professional concerning a female patient with no pertinent medical history reported who in February 2009, was vaccinated with the first dose of GARDASIL (Lot # 1147U and Batch # NH17630). Concomitant therapy was not reported. It was reported that on an unknown time post vaccination the patient experienced dizziness but she was looked after at the vaccination center. The patient did not return for her second vaccination and was then contacted by the vaccination centre who were told that the patient had been hospitalized in a children's hospital following a seizure. Whilst in hospital tests revealed an irregular heartbeat and the patient was then transferred to another hospital. The patient's outcome was not reported. Other business partner numbers include: E2009-09157. No further information is available.

MedDRA PT Back pain, Clumsiness, Gait disturbance, Hypoaesthesia, Immediate post-injection reaction, Inguinal hernia, Nasopharyngitis, Neck pain, Pain in extremity, Rash, Skin papilloma, Urinary tract infection

Symptom Text: Immediately: sharp pain in lower back, arm pits, and neck. Hours later: numb limbs, clumsy hands/fingers One week later: rash on the back of thighs After three weeks: rash covered most of thighs, calfs, and near under arms. Was so severe walking was painful. Visited doctor for rash at three weeks: was prescribed Pepcid AC, Benadryl, and Xyzal. I took one Pepcid and one Xyzal for 4 days and the rash went away almost completely. I stopped taking them because I got a cold. Now I use topical Benadryl for my rash, which only comes back when it is hot and humid outside. I'm only saying I didn't recover because my rash comes back every once in a while even after taking the pills. I never had a rash that painful in my life. The biggest rash I ever had before Gardasil was a couple little red bumps from grass irritation that went away in just minutes. 10/13/09 Medical Records received for Date of Service 8/12/08. Dx: UTI, Plantar wart, inguinal hernia First Gardasil shot given.

Other Meds: Necon 777 (birth control) I also take a daily Kirkland multivitamin (approved by the USP).

Lab Data: No tests were performed on me because no one believed Gardasil was to blame.

History: allergy to grass and rag weed. PMH: Allergy to Allegra on OCP's.

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Joint swelling, Musculoskeletal stiffness, Oedema peripheral, Pain in extremity, Rheumatoid arthritis, Tenderness

Symptom Text: Information has been received from a medical assistant concerning a 16 year old female with hypothyroidism, eczema and acne who on 06-JUN-2008 was vaccinated with the first dose of GARDASIL (0.5ml, IM). The patient received the second dose of GARDASIL (0.5ml, IM) on unspecified date. On 13-FEB-2009 the patient received the third dose of GARDASIL (0.5ml, IM). The patient was diagnosed with viral or early rheumatoid arthritis by a rheumatologist. Her symptoms began 1 month after the third vaccination. The rheumatologist evaluated the patient in May 2009 where he said it was either viral arthritis or early rheumatoid arthritis. The rheumatologist said the patient was not in acute distress but joints were sensitive. The rheumatologist said he was leaning to early rheumatoid arthritis because of the duration of symptoms. At the reporting time the patient had not recovered. Follow-up information has been received from a clinical manager: The patient had previous drug reaction (vomiting) to codeine and CEFTIN. The patient was vaccinated with GARDASIL series as following: the first dose on 06-JUN-2008, lot# 658558/1061U; the second dose on 28-JUL-2008, lot# 658558/1061U; the third dose on 13-FEB-2009, lot# 661764/0650X; no other vaccines given on these dates. Concomitant therapy included SYNTHROID. The consult report from a rheumatologist from May 2009 showed "early rheumatoid arthritis". The report from the rheumatologist from 25-AUG-2009 showed that the patient was started on ENBREL, 50 mg weekly and methotrexate, 12.5 mg weekly for rheumatoid arthritis (RA). Follow-up information was received from the medical assistant via medical records indicating that the patient was a student and was vaccinated with three doses of GARDASIL IM in the left arm. The patient's symptoms occurred on 03-MAR-2009. On 02-MAY-2009 parvovirus B-19 antibody (IGM) was negative (<0.9), rheumatoid factor was 21 IU/ml, C-reactive protein was 0.26 mg/dl, thyroid-stimulating hormone (TSH) was 3.36 mIU/L and sed rate was 11 mm/h. She was diagnosed w

MedDRA PT Asthenia, Headache, Malaise, Nausea, Respiratory distress

Symptom Text: Case received from health authority on 28-SEP-2009 (HA reference # PEI2009020985). Case was assessed as serious, (other medical event/ probable extremely long duration of symptoms). It was reported that a 16 year old female patient was vaccinated on 30-APR-2007 with the first dose of GARDASIL (Lot # 654740/0859F, batch NE29669), the second dose of GARDASIL (lot#1341F, batch NF1376) on 25-JUN-2007, and the third dose of GARDASIL (Lot #0278U, batch NFS56940) on 16-NOV-2007, intramuscularly into the left arm. On an unspecified date, the patient developed ill feeling, headache, nausea and relapsing respiratory distress. At the time of report to health authority on 15-SEP-2009 she had not yet recovered. Medical history included DPT, HIB and poliomyelitis vaccinations (manufacturer unknown by the reporter) on 03-JUL-1991, 31-JUL-1991 and 04-SEP-1991. On 05-JAN-1991, patient experienced fever and tense fontanel, which led to hospitalization. Meningitis was ruled out. Patient received TWINRIX on 06-MAY-2002, 17-JUN-2002 and on 06-JAN-2004 (lot #HAB285A9). After the third dose the patient developed "unclear" asthenia, nausea and headache. This case was closed. Other business partner numbers included: E2009-09023. No further information is available.

MedDRA PT Erythema, Lupus nephritis, Systemic lupus erythematosus

Symptom Text: Information has been received from a physician concerning a 27 year old female who in February 2009, was vaccinated with GARDASIL first dose, Apr, 2009 second dose. There was no concomitant medication. In April 2009, the patient experienced erythema that worsened after the second vaccine dose was received. In Aug, 2009 the patient attended to the physician's office. The physician requested laboratory tests and confirmed diagnose of erythematous systemic lupus. In Aug, 2009 the patient was evaluated by a nephrologist who diagnosed lupus nephritis. The patient's erythema, erythematous systemic lupus and lupus nephritis persisted. The reporter considered erythema, erythematous systemic lupus and lupus nephritis causality as unknown. Upon internal review lupus nephritis and erythematous systemic lupus were considered as other medical events. No further information is available.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse through the pregnancy registry for GARDASIL concerning a female who on unspecific date was vaccinated with a dose of GARDASIL (Lot # not provided). The nurse reported that a patient received the vaccine when she was pregnant. The patient voluntarily terminated the pregnancy when she learned that she was pregnant. Patient has sought unspecified medical attention. Additional information has been requested.

MedDRA PT Facial palsy

Symptom Text: Information has been received from a Health Authority concerning a female patient born in 1989 and with a good general health status received the first dose of GARDASIL (Batch number not reported) in February 2009 and the second dose of GARDASIL (Batch number not reported) on 15-APR-2009. On 16-APR-2009, she presented with a slight facial paralysis. At the time of reporting, the outcome was unknown. To be noted that the Health Authority assessed the relationship between the vaccine and the event as unlikely. The Health Authority considered the event as medically significant. Other business partner numbers included: E2009-09190. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Dizziness, Dyspnoea, Injection site erythema, Nausea, No reaction on previous exposure to drug, Pharyngeal oedema

Symptom Text: Initial case was reported on 28-SEP-2009 Health Care Professional. Additional information was received by the patient's mother the same date. It was reported that a 15 year old female with underlying asthma who on 04-FEB-2009 was vaccinated with the first dose of GARDASIL (batch# NH38510, lot# 1400U, route and site of administration not reported). On 23-MAR-2009 the patient was vaccinated with the second dose of GARDASIL (lot#, route and site of administration not reported). On 24-MAR-2009 the patient experienced an asthmatic attack. She got swollen in the throat, difficult breathing as well as dizziness. she was taken to the emergency and some tests were taken. For example blood pressure and oxygen saturation, all normal according to the mother. The patient received VENTOLINE for the asthma attack and was hospitalized for one day. The patient felt dizzy for quite a long time afterwards, but is now feeling fine. At the time of this report, the patient had recovered. The patient had underlying asthma and taken medicine (not specified) on a regular basis. But she had never experienced an asthma attack in relation to an injection before. The patient received her first dose of GARDASIL without experiencing any adverse events. Additional information was received by healthcare professional on 01-OCT-2009: The girl did not experience an asthma attack. She did in fact experience severe dizziness and nausea with onset on 24-MAR-2009. She also developed injection site redness with onset on the day of vaccination, 23-MAR-2009. On 25-MAR-2009 the patient was hospitalized over night. Blood pressure, pulse and oxygen saturation were normal. The girl was discharged from hospital the next day. Her doctor concluded that GARDASIL vaccination was the probable cause of these adverse events. The girl had a history of asthma and eating disorder. The outcome was recovered. Case is closed. Other business partner numbers included: E2009-08991. No further information is available.

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Abasia, Activities of daily living impaired, Anaphylactic reaction, Anxiety, Arthralgia, Arthropod bite, Asthenia, Asthma, Bone pain, Bronchospasm, Confusional state, Conversion disorder, Convulsion, Dehydration, Depression, Diarrhoea, Disorientation, Dizziness, Drug toxicity, Dyskinesia, Dyspareunia, Dysplasia, Dyspnoea, Ear pain, Eustachian tube disorder, Eye swelling, Fall, Fatigue, Generalised oedema, Hypersensitivity, Hypertension, Hypoaesthesia, Hypoaesthesia facial, Hyporeflexia, Immediate post-injection reaction, Immune system disorder, Leukocytosis, Malaise, Movement disorder, Muscle rigidity, Musculoskeletal pain, Musculoskeletal stiffness, Myalgia, Myoclonus, Nasal congestion, Nausea, Neurological symptom, Pain, Pain in extremity, Palpitations, Paraesthesia, Paralysis, Pruritus, Rash, Rash erythematous, Rhinitis, Sensory disturbance, Sensory loss, Swelling face, Syncope, Tonsillitis, Tremor, Urinary tract infection, Urticaria, Vaginal discharge, Vomiting, Vomiting projectile, Vulvovaginal candidiasis

Symptom Text: I received the second shot of Gardasil vaccine on July 3, 2008 at 7:00 PM in my left deltoid. I immediately developed a rash following 15 minutes after vaccination. An hour after the injection, I was feeling dizzy and disoriented. I was admitted to the emergency room of the Tri-City Medical offices on July 14th, due to projectile vomit, dehydration, and weakness. I was dangerously dehydrated after throwing up more than 15 times in a single hour and was unable to swallow my own saliva without throwing up again. I was incapacitated and unable to walk, requiring to be carried into the hospital. Following my emergency room visit, I started experiencing hyper-sensitivity to my environment and products I used in my daily routine; a symptom characteristic of Polysorbate 80 poisoning considering it has been known to produce reactions of anaphylaxis, which is a constituent in the Gardasil vaccine. I experienced allergic reactions to face creams that were a customary part of my routine for years, inducing swelling of my face and nasal passages. These reactions continued without explanation and though I discontinued the use of all products that created reactions, my body's hyper-sensitivity did not dissipate. On August 2, 2008 I applied my acne cream Retin-A micro at night. By the morning, the entirety of my face had become severely swollen and did not recede completely for two days. It was so severe that it shut my right eye completely. Retin-A had never been a problem before. I was then bitten by an unknown insect in my sleep a few days later and awoke to find a swollen growth the size of a golf-ball on my arm. It was extremely itchy and an incredible ache spread through my arm and up to my shoulder. The following morning the swelling had disappeared and the ache had receded. On August 9, I started to loose all my sensation in my legs. The numbness slowly spread first throughout the left side of my body, including my face and head. In the following two days it consumed the rest of my body, numbing in

Other Meds: None

Lab Data: I'm seeking a thorough blood panel by a toxicologist, because the primary cause of my illness is based on the toxins of Gardasil. Other diagnostic tests cannot and haven't identified the cause of my symptoms, despite them being ongoing. 10

History: None 10/21/09 Medical records received for dates 6/22/08 to 10/15/09 PMH: chronic sinusitis, malaise/fatigue, anxiety disorder, asthma. Allergy to tetracycline, chloroquine, EEC, retin A, cipro, gardasil vaccine.

MedDRA PT Computerised tomogram, Concussion, Convulsion, Dizziness, Fall, Hyperhidrosis, Immediate post-injection reaction, Joint injury, Loss of consciousness, Nausea, Neck pain, Somnolence, Syncope, Tooth injury, Unresponsive to stimuli

Symptom Text: Information has been received from a physician concerning a 16 year old female with no known drug allergies, no pertinent medical history or concurrent conditions, who on 24-SEP-2009 was vaccinated with the 0.5 mL first dose of GARDASIL (lot # 663452/0671Y). No other vaccines or concomitant medications administered. The nurse administered the injection and the patient had immediate syncope with no warning and loss of consciousness for 15 seconds. The patient fell forward off the exam table, chip a tooth, scraped her knee, had a seizure and a concussion. The whole incident was 15 seconds. The physician stabilized her neck to open her airway, turned her on her back and patient came around. The patient was transported to emergency room and got a CT scan of head and neck performed (result not reported). Subsequently the patient recovered from the events. The physician's receptionist contacted during telephone follow-up, stated that the patient was not hospitalized and could not comment on disability or whether the event was life threatening, as there was no mention of this in the patient's chart. Seizure, syncope with no warning, fell forward off the exam table, chip a tooth, scraped her knee and concussion were determined to be an other important medical event by the physician. No further information is available. 12/30/09 PCP record received for DOS 09/28/07- 10/15/09. Patient had syncopal episode after receiving 1st dose of Gardasil on 09/24/09. Fell forward and hit head. Pt. was diaphoretic and unresponsive for 10-15 seconds with 3 second seizure. Transferred to ED. On 09/25/09 Pt. presents for ER followup with neck pain. Tx. with Advil. Phone call from mother on 9/28/09 reports pt. having dizziness, sleepiness and nausea. Pt. went to school on 9/29/09 with headache and persistent sensitivity to left side of face. 01/04/10 ED records received DOS 02/21/06

MedDRA PT Drug exposure during pregnancy, Foetal disorder, Papilloma viral infection, Rash generalised

Symptom Text: Information has been received from a registered nurse for the Pregnancy Registry for GARDASIL, concerning a 17 year old female with depressive disorder and no known drug allergies who on 17-AUG-2007 and 11-MAY-2009 was vaccinated with first dose (lot number 656051/0244U) and second dose (659184/0843X), respectively of GARDASIL. Concomitant therapy included LEXAPRO. On an unspecified date after the patient received the second dose of GARDASIL, a PAP test was positive for HPV. The registered nurse reported that the patient is now pregnant. The patient's LMP was on 01-JUN-2009 and the EDT was 08-MAR-2010. The registered nurse reported that there was an abnormality in fetus. An initial ultrasound by their office found an abnormality and the patient was referred to an unspecified perinatologist who did another ultrasound which also showed the abnormality. There were additional work ups being done followed by perinatologist and by their office. Follow up information was received from a Licensed Practical Nurse. She reported the patient was being seen for her Ob/Gyn care. The patient received 2 doses of GARDASIL at her Pediatrician's office: the first dose was administered on 17-AUG-2007 (Lot number 656051/0244U, route not reported) and the second dose was given on 11-MAY-2009 (Lot # 659184/0843X). The patient has a history of Bipolar disorder for which she was being treated with LEXAPRO (start date not reported). The patient's LMP was reported as 01-JUN-2009 and her EDD is 08-MAR-2010. The licensed practical nurse further added that the maternal great uncle of the baby's father had a history of mental retardation. The patient was on no other concomitant medications and had no other vaccinations at the same time as her GARDASIL injections. After the patient discovered she was pregnant, she stopped taking LEXAPRO (stop date not reported). The patient had a body rash during her first trimester (no further details were provided). The patient underwent a pregnancy ultrasound, the following was noted: The fetus has a misshap

Other Meds: LEXAPRO

Lab Data: Ultrasound, fetus has a misshapen skull with anterior and posterior bulging at the forehead; Pap test, Positive

MedDRA PT Laryngeal oedema, Rash, Tongue oedema

Symptom Text: Information has been received from a physician concerning a 13 year old female who on 06-OCT-2009 was vaccinated with GARDASIL first dose. On 06-OCT-2009 two hours after the vaccination the patient experienced skin rash, larynx edema and tongue edema, the patient was in the health center, where received basic medical care and one dose of adrenaline (dose not reported). After six hours the patient recovered from skin rash, larynx edema and tongue edema. The reporter felt that skin rash, larynx edema and tongue edema were related to therapy with GARDASIL. Upon internal review, the patient's skin rash, larynx edema, and tongue edema were considered to be other important medical events. Additional information is not expected.

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Arthralgia, Disability, Emotional distress, Fatigue, Fibromyalgia, Foot deformity, Gait disturbance, Gastrooesophageal reflux disease, Goitre, Hypersomnia, Inflammation, Joint swelling, Lethargy, Limb discomfort, Malaise, Mitral valve incompetence, Mobility decreased, Muscle fatigue, Muscle spasms, Muscular weakness, Musculoskeletal stiffness, Myalgia, Neuritis, Pain, Pain in extremity, Parvovirus infection, Pulse absent, Tendonitis, Tricuspid valve incompetence, Vaccination complication

Symptom Text: I have been experiencing bilateral muscle fatigue and pain in feet and legs for almost three years now. They began when I was a 19 year old female pre-medical college student with a history of moderate alcohol use and smoking, and no major diseases except mild scoliosis as an adolescent and shingles at age 17, which indicates some auto-immune issues. I wear orthotics for my flat feet and have a history of swollen Achilles tendons and other feet problems. I was in great physical shape as I exercised five times a week for an hour. After volunteering in a hospital, on my feet for three hours, I experienced a sudden onset of intense foot pain in February 2007 which disabled my mobility for the rest of the day. From then on, my leg muscles were extremely weak and fatigued so much that I was not able to climb up stairs or walk from my dorm to classes on campus. I also experience sporadic pain throughout different places in my legs and feet, including knee, ankle, thigh, and foot pain. Sometimes the pain is so bad I will all of a sudden be forced to limp as I cannot put any pressure on my foot after it has a sort of spasm. I sometimes experience these spasms while driving and have to pull over and can no longer drive, and I can no longer drive longer distances. I also experience stiffness and aches in my legs and feet late in the night, in the mornings, and after keeping them in one position for awhile. After I drink alcohol, my symptoms become worse and more frequent for the following week proportionate to the amount of alcohol consumed. Podiatrist Evaluation Feb. 2007: Podiatrist examined my orthotics which were too old and diagnosed me with congenial pes planus and limb pain. Podiatrist took a slipper cast of each foot and made orthotics which corrected the pes planus as best as they could. Podiatrist ordered physical therapy three times a week to strengthen my leg muscles which were extremely weak during strength and resistance testing. Podiatrist referred to a back specialist to determine if any lower back proble

Other Meds: Yasmin

Lab Data: - Back specialist took X-Ray of lower back to determine if any lower back problems at the Center are influencing the leg issues in March 2007. X-Ray was normal. - Orthopedist then ordered a nerve conduction test and electromyography (EMG)

MedDRA PT Dermatitis contact, Eye pruritus, Eye swelling, Oral pruritus, Pruritus, Rash, Swelling face

Symptom Text: My 12 year old daughter received her second GARDASIL shot Wednesday, September 30, 2009. She complained of her tongue itching later that night. I started giving her ZYRTEC. The next day she was complaining of itching her face around her eye. I gave her ZYRTEC twice a day until Friday night when she developed a rash on the right side of her face around her eye. At that point I started giving her BENADRYL every four hours. Her face was significantly swollen on the right side by Saturday night. Sunday morning, her eye was swollen nearly shut. The right side of her face was swollen so severely, she was unrecognizable from her profile. I applied cool compresses, continued BENADRYL, and gave TYLENOL for the discomfort. I tried to get an after hours appointment but was told by th on-call nurse to continue the BENADRYL and that unless she had blister, there was no reason to see the doctor. Monday her eyes were completely swollen shut, and her skin was so lightly swollen the itching had subsided. I did get her a doctor's appointment that afternoon but was told it was contact dermatitis, and that it had nothing to do with the second GARDASIL shot that she had five days earlier. I asked the doctor to document the possibility that it was a reaction to the shot in her records. She said it was worth noting but that she had not seen any such reactions. I do not believe she documented it. She prescribed 60mg of PREDNISONE a day for five days and told me to continue to giver her the 50 mg of BENADRYL every four hours. By Monday night the very raw and irritable rash had spread to the other side of her face. Tuesday the swelling on the right side had lessened but her cheek and eye were still puffy and the hives were still very raw. Tuesday night the rash had spread to cover most of the left side of her face, behind both ears toward the back of her neck, and under her chin, down her neck and onto her chest. I continued to following doctor's instructions giving her the BENADRYL and PREDNISONE. Wednesday morning the redness had subsi

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Latent tuberculosis, Vaginal haemorrhage

Symptom Text: Information has been received from a medical assistant and a nurse, for the Pregnancy Registry for GARDASIL, concerning a 16 year old female patient who on 22-JUL-2009 was vaccinated intramuscularly with the first 0.5 ml dose of GARDASIL (reporter not able to locate lot number). The patient was a "refugee" and came to the new country on 11-JUN-2009. On 16-SEP-2009, the patient was seen in Health Department had a Pregnancy test which was positive. The patient Last Menstrual Period was 07-JUL-2009. On 28-SEP-2009, the patient was vaccinated intramuscularly with the second 0.5 ml dose of GARDASIL (lot # 662518/0087Y) and concomitantly received FLUZONE (lot# U3174EA), the third dose of RECOMBIVAX HB (lot # 663313/1445X), the second dose of VAQTA (lot # 664625/0810Y) and IPOL (lot # B0476). On 28-SEP-2009, the patient was seen for latent tuberculosis and was prescribed isoniazid therapy. On 03-OCT-2009, the patient had a miscarriage and was seen in hospital. The patient was only 6 weeks pregnant at the time of miscarriage and reason for miscarriage unknown. The patient was not admitted to the hospital. On 06-OCT-2009, the patient was seen in a Pediatric Clinic and had menstrual type bleeding at that time. On 08-OCT-2009, the patient was schedule for follow-up laboratory blood tests and was to be referred to Family Planning. At the time of the report, the patient was recovering. Upon internal review, miscarry was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Autoimmune thyroiditis, Fatigue, Hypothyroidism, Menstruation irregular, Myalgia

Symptom Text: Information has been received from a physician concerning a 13 year old female who in 2008 was vaccinated with GARDASIL. The patient completed the series of GARDASIL in 2008 and was recently diagnosed with Autoimmune Thyroiditis (2009). The patient sought her pediatrician. At the time of the reporting, the patient had not recovered from the event. Follow up information received on 06-OCT-2009 from a physician via medical records indicated that the patient was female student, with no medical history, known allergies or illness at the time of vaccination. The patient's family history included hypothyroidism and polycystic ovary syndrome (mother), aniridia (brother) and hypothyroidism (paternal grandmother). On 26-NOV-2008 the patient was vaccinated with a third dose of GARDASIL (lot # 650557/0072X), intramuscularly into the left arm. Secondary suspect vaccination given on the same day included a third dose of FLUZONE, (lot # U2760AA), intramuscularly into the right arm. The patient presented with her mother in the physician's office on 19-MAY-2009, complaining of feeling tired, muscle aches and requiring long naps. She has been experiencing these symptoms for the last couple of months (end of school year). The myalgias were generalized and most pronounced in her knees, hips and shoulders. TYLENOL helps some. She has been sleeping well-getting 8 hours of sleep without significant interruption. She generally feels well rested in the morning. She has not been short of breath and she denies fever, chills, night sweats, nausea, vomiting. She started her menstrual periods last July and they have been irregular. Her mother noticed that the fatigue and body aches were more pronounced just prior to her most recent menstruation. She had no urinary problems and she denied increase thirst. She grew approximately 2 inches in height in the past year. The physical exam was within normal limits. The patient developed hypothyroidism diagnosed on 19-MAY-2009 with symptoms beginning in March 2009 (approximate). The patient had a comp

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Arthralgia, Autoimmune thyroiditis, Fatigue, Hypersomnia, Hypothyroidism, Menstruation irregular, Myalgia, Pain

Symptom Text: Information received on 20 October 2009 from another manufacturer (report number WAES 0908USA04293) whose initial reporter was a physician. "Information has been received from a physician concerning a 13 year old female who in 2008 was vaccinated with GARDASIL. The patient completed the series of GARDASIL in 2008 and was recently diagnosed with Autoimmune Thyroiditis (2009). The patient sought her pediatrician. At the time of the reporting, the patient had not recovered from the event. Follow up information received on 06-OCT-2009 from a physician via medical records indicated that the patient was female student, with no medical history, known allergies or illness at the time of vaccination. The patient's family history included hypothyroidism and polycystic ovary syndrome (mother), aniridia (brother), and hypothyroidism (paternal grandmother). On 26-NOV-2008 the patient was vaccinated with a third dose of GARDASIL (lot # 660557/0072X), intramuscularly into the left arm. Secondary suspect vaccination given on the same day included a third dose of FLUZONE, (lot # U2760AA), intramuscularly into the right arm. The patient presented with her mother in the physician's office on 19-MAY-2009, complaining of feeling tired, muscle aches and requiring long naps. She has been experiencing these symptoms for the last couple of months (end of school year). The myalgias were generalized and most pronounced in her knees, hips, and shoulders. TYLENOL helps some. She has been sleeping well-getting 8 hours of sleep without significant interruption. She generally feels well rested in the morning. She has not been short of breath and she denies fever, chills, night sweats, nausea, vomiting. She started her menstrual periods last July and they have been irregular. Her mother noticed that the fatigue and body aches were more pronounced just prior to her most recent menstruation, She had no urinary problems and she denied increase thirst. She grew approximately 2 inches in height in the past year. The physician exam was within normal l

MedDRA PT Convulsion, Head injury, Loss of consciousness, Musculoskeletal stiffness

Symptom Text: Information has been received from a registered nurse concerning a 14 year old female who on 08-OCT-2009 was vaccinated with her second 0.5mL dose of GARDASIL (route and lot number not reported). Concomitant therapy included FLUMIST. IT was reported that half an hour later, on 08-OCT-2009, the patient experienced passed out, hit her head and had a seizure. The patient was taken to the emergency room and was released. The physician felt it was important to note that the patient had not eaten prior to vaccination. The patient recovered from hit her head, passed out and seizure on the same day. Follow up information was received from a registered nurse concerning the 14 year old female patient with no pertinent medical history reported and no known drug allergies who on 08-OCT-2009 was vaccinated with her second dose of GARDASIL (lot number 663451/0216Y) and concomitantly with a dose of FLUMIST (lot number 500711P). The registered nurse reported that the patient left the office and was in a restaurant when she "passed out and stiffened" on 08-OCT-2009. The patient was taken to the ER where a CT of the head, EKG, chest X-ray and blood work were performed (all normal). No treatment was needed. It was noted that the patient received the first dose of GARDASIL (route not reported, lot number 664780/0904Y, valid for ROTATEQ) on 16-JUL-2009. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Anxiety, Arthralgia, Asthenia, Convulsion, Dizziness, Influenza, Monoplegia, Myalgia, Pain in extremity, Paralysis, Vaccine positive rechallenge

Symptom Text: Information has been received on 06-OCT-2009 by Health Authority (HA ref. DK-DKMA-20092549) concerning a 15 year old female who in ultimo December 2008, was vaccinated with the first dose of GARDASIL intramuscularly (lot#, batch# and site of administration not reported). There was no concomitant medication. It was reported that on 01-JAN-2009 the patient experienced muscular pain, convulsions, joint pain, dizziness and weakness. The patient was diagnosed with influenza by the doctor from the emergency service and received treatment with PANODIL (manufactured by GlaxoSmithKline, dose not reported, no dates reported). According to the patient's parents, the symptoms were not consistent with influenza, thus the patient's GP was contacted a few days later. The patient was referred for a neurological examination that revealed no abnormalities except paralysis of extremities. It was not specified which examinations that were performed or the date of neurological examination. One week later, the patient's condition had not improved. The patient was seen by a reflexologist who stated that the patient was "cold" (not further specified). The patient was treated with warmth, reflexology and diet advice (not further specified). It was reported that patient's condition improved slowly and the patient recovered on an unspecified date. It was reported that the symptoms returned in February 2009 (not further specified), and that the patient also experienced anxiety due to the uncertainty regarding causality. The neurological examination was repeated with the same conclusion (no abnormalities except paralysis of extremities). After a week, the symptoms had declined and the patient recovered. In primo March 2009, the patient was vaccinated with the second dose of GARDASIL intramuscularly (lot#, batch# and site of administration not reported). No adverse reactions were reported. In primo May 2009, the patient was vaccinated with the third dose of GARDASIL intramuscularly (lot#, batch# and site of administration not reported). It wa

MedDRA PT Condition aggravated, Hypoaesthesia, Multiple sclerosis, Paraesthesia

Symptom Text: Information has been received from a physician concerning a 27 year old female with multiple sclerosis (1st attack in summer 2008 - paresthesia of left lower extremity). This woman was in middle of February 2009 vaccinated with GARDASIL, 1st dose. During vaccination patient was without problems and she was not on any therapy. On 10-MAR-2009 the patient experienced hypoaesthesia and paresthesia generalised, and from March 13 to March 19, 2009 she was hospitalized. During hospitalization were done following tests: magnetic resonance imaging - Thorax spine - finding: nidus 7.5 x 2.5 mm in C3 location; magnetic resonance imaging - Brain - finding: few supratentorial plaques; lumbar punction - findings: leucocytes - 14; plasmatic cells presented in cytology exam; cerebrospinal fluid oligoclonal band profile test (results not reported). The reporter conclude that this is 2nd attack of multiple sclerosis. The reporter felt that hypoaesthesia and paresthesia generalised (multiple sclerosis, worsening) could be related to vaccination with GARDASIL. Additional information is not expected.

MedDRA PT Asthenia, Balance disorder, Condition aggravated, Conjunctivitis, Fatigue, Gastritis, Headache, Impaired work ability, Muscle spasms, Muscle twitching, Nausea, Photophobia, Tremor, Vaccine positive rechallenge

Symptom Text: Information has been received from a physician concerning a 19 year old female patient with headaches (one every couple of months) and a history of aspirin causing a rash and a bee sting causing a local reaction who was vaccinated intramuscular (right arm) with 0.5 ml dose of GARDASIL on 05-AUG-2009 (Lot # 659054/0315Y) and on 30-SEP-2009 (Lot # 662304/1013Y) respectively. The physician reported an increase in headaches after administration of GARDASIL. The reporter mentioned that a week after receiving her first dose of GARDASIL "approximately on 12-AUG-2009" the patient started experiencing headaches 2 to 3 times a week. It was reported that five days after her second dose "on 05-OCT-2009" the patient started to experience disabling headaches 2 to 3 times a day, severe involuntary muscle spasms in her right arm, tremors, nausea and weakness. Also was reported that the patient was so weak that she was not able to work. The patient was examined in two emergency rooms on 07-OCT-2009 and on 11-OCT-2009 respectively but the patient was not admitted to the hospital either time. The reporter mentioned that she was treated with IMITREX, BENADRYL, "pain medicine", and ondanstron. The patient will have an appointment with a Neurologist (name not provided) on 15-OCT-2009. It was reported on 14-AUG-2009 as laboratory and diagnostics test a CAT (Computed Axial tomography) scan and MRI (Magnetic resonance Imaging) of brain: normal; Blood chem., CBC (Complete Blood Cell Count) and urinalysis: all negative and a PAP (Papanicolaou test) smear without results. The patient sought medical attention in office visit. at the time of reporting the patient was not recovered. MedDRA PT Ecchymosis, Haematoma, Petechiae, Systemic lupus erythematosus, Thrombocytopenia, Thrombocytopenic purpura, Vaccine positive rechallenge

Symptom Text: Information has been received from Health Authorities (reference numbers BR20090281 NS/29/CHU/ICH) concerning a 20 year old female patient who on 29-FEB-2008 was vaccinated intramuscularly with the first dose of GARDASIL (batch number NH00400, lot number 1146U). On 26-APR-2008 the patient was vaccinated intramuscularly with the second dose of GARDASIL (batch number NH00400, lot number 1146U). On 19-AUG-2009 the patient vaccinated intramuscularly with the third dose of GARDASIL (batch number NH13370, lot number 1208U). The patient was concomitantly taking contraception. In December 2008, during a blood donation, a thrombocytopenia at 90 giga/l platelets was discovered. The patient then mentioned that during the vaccination, she had experienced petechias with hematomas. When she consulted in September 2009, she did not present with hemorrhagic symptomatology. However, she easily presented with ecchymosis. Blood cells count found a thrombocytopenia at 69 giga/l with an index of immature platelets at 20%. No impairment of other blood lineages was found. There was no coagulation activation (D-dimer inferior to 0.20 mcg/ml), no circulating anticoagulant nor antithromboplastin. Antinuclear antibodies very positive were found of specked type. Native anti-DNA antibodies were positive. HIV hepatitis B and C serologies were negative. The Health Authorities concluded to an isolated thrombocytopenia, probablement peripheral, in the context of a lupus with positive antinuclear antibodies and positive anti-DNA antibodies. The thrombocytopenia appeared a few months after the three injections vaccine. Laboratory results were as following: September 2009: Fibrinogen at 3.63 gl, White cells at 3.4 giga/l, Hemoglobin 12.8g/dL; Prothrombin time at 92%; Mean corpuscular volume at 83fL; December 2007: platelets at 278 giga/l; December 2008: platelets at 90 giga/l. At the time of reporting, the outcome was unknown. Lupus erythematosus, thrombocytopenia, and purpura thrombocytopenic were considered to be other important medical events. T

MedDRA PT Arachnoid cyst, Areflexia, Asthenia, Back pain, Blood product transfusion, Endotracheal intubation, Guillain-Barre syndrome, Haemothorax, Hypoaesthesia, Hypoaesthesia oral, Influenza like illness, Intensive care, Multiple sclerosis, Muscular weakness, Pain, Plasmapheresis, Polyneuropathy idiopathic progressive, Reflex test abnormal, Respiratory failure, Sinus tachycardia, Tracheostomy

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 26 year old female with a history of anaemia, previous-smoker and family history of GBS, on 17-AUG-2009 was vaccinated with a fourth dose of GARDASIL (lot # 662404/0312Y, route unknown) in the left arm. Concomitant therapy included YAZ. On 30-SEP-2009 the patient experienced arachnoid cyst, areflexia, asthenia, back pain, blood product transfusion, endotracheal intubation, Guillain-Barre syndrome, haemothorax, hypoaesthesia, hypoaesthesia oral, influenza like illness, intensive care, muscular weakness, plasmapheresis, reflex test abnormal, respiratory failure and tracheostomy. The patient experienced ascending paralysis, respiratory failure requiring intubation. She had IVIG (intravenous immunoglobulin) for 5 days followed by plasmapheresis for 5 days. The patient remained intubed and was in ICU (intensive care unit). On 22-OCT-2009 Hospital records were received for dates 01-OCT-2009 to 26-OCT-2009. The patient was currently diagnosed as GBS (Guillain-Barre syndrome). On 01-OCT-2009 the patient presented to ER with complaint of numbness in all extremities, pain, weakness in legs, back pain, numbness in mouth. Patient was in ER 1 day prior and sent home. Symptoms increased patient returned to ER. The patient complained of flu like symptoms 10 days prior. Assessment: WNL (Within normal limits) except, absent knee reflexes, hypoflex of lower extremities (+) intramuscular fluid around dpine at occipital cervical junction. The patient's diagnoses at time of assessment were GBS vs idiopathic polyneuropathy vs MS (Multiple Sclerosis). Patient was admitted to medical unit, symptoms deteriorated and she was transferred to ICU. Further assessments: absent deep tendon reflexes of upper and lower extremities, complaint of pain throughout entire spine. MRI of spine (+) arachnoid cyst. On 05-OCT-2009 the patient was intubated, and treatment with IVIG, no response. The patient had lab test of P

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Injection site pain, Limb discomfort, Pain

Symptom Text: Patient complains of pain in her left arm at the injection site since receiving her first dose of Gardasil on 10/7/2009. She first reported this complaint to our office on 10/14/2009 and stated that the pain was worse with movement and she was experiencing difficulty using her left arm due to the discomfort, and she was advised to try ibuprofen and heat. She returned to our office on 10/16/2009 for evaluation and reports that ibuprofen has not provided adequate relief and heat made the pain worse. Upon examination, there is no erythema or swelling at the site and no tenderness to palpation. There is full range of motion and normal grip and fine motor movement in both hands. She was given a prescription for a non-steroidal anti-inflammatory medication and will follow up next week to report on her condition.

Other Meds: ibuprofen

MedDRA PT Balance disorder, Dysarthria, Hypoaesthesia, Menstruation irregular, Multiple sclerosis, Paraesthesia, Paralysis, Reflex test abnormal, Vision blurred

Symptom Text: Information has been received from a healthcare worker concerning a 25 year old female patient with no pertinent medical history and no known allergies who on an unspecified date was vaccinated with the first dose of GARDASIL (lot number not reported). The patient was new to the practice and the vaccine was not given in this practice. 2 days after the vaccination, the patient developed numbness to her left side. About 2 weeks after the onset of those symptoms, the patient was diagnosed with Multiple Sclerosis (MS). The patient saw family physician and neurologist (date unspecified). It was unknown if there were lab studies performed. At the time of the report, the outcome of the patient was not reported. Multiple sclerosis was considered to be disabling by the reporter. Follow-up information received from a medical assistant (MA) concerning the 23 year old (previously reported as 25 years old) female patient who on 19-FEB-2008 was vaccinated with the first dose of GARDASIL (lot number not reported). The MA did not know the physician's name where the patient received the vaccine. On 05-FEB-2009, the patient was first seen in the office for irregular bleeding. On MAR-2009 the patient was seen again and the irregular bleeding had resolved. Additional infoformation has been requested. 10/23/2009 records from Neurologist, multiple visits 3/2008-7/2009. Patient's sx started 2/2008 with numbness/tingling, inbalance, slurred speech, blurred vision and paralysis, LUE and LLE. PE noted hyperreflexia bilaterally, Romberg's sign absent. Dx MS

MedDRA PT Rash, Rash maculo-papular

Symptom Text: Information has been received from a Gynecologist concerning a 15 year old female patient with herpes simplex who in June 2009, was vaccinated with the first dose of GARDASIL (Batch # not reported) into her arm. Secondary suspect vaccine given in June 2009 in the other arm included a dose of ENGERIX-B (exact date not provided). Other concomitant therapy included ZELITREX. It was reported that a few hours after vaccination, she was hospitalized due to a generalized maculo papular exanthema. The patient received an unspecified treatment. It was reported that tests and work-ups were performed (results not provided). To be noted that at the time of vaccination, the patient was treated with ZELITREX for an ongoing herpes simplex. The hospital contraindicated to continue the vaccination with GARDASIL and ENGERIX-B. To be noted that the reporter did not see the patient at the time of the event, but only read a letter from the hospital. At the time of reporting, the patient had recovered. Other business partner numbers include: E2009-09559. No further information is available.

MedDRA PT Hypoaesthesia, Myalgia, Paraesthesia

Symptom Text: Information has been received from a female who on 29-SEP-2009 was vaccinated with the first dose of GARDASIL, lot # not available. On 07-OCT-2009 the patient experienced tingly numbing feeling in quads (only her quads not her hamstrings, calves or feet) and tender muscles (whenever she would apply pressure to her quads). The patient reported that it felt like her legs were starting to wake up after being "asleep". On 08-OCT-2009 the patient recovered from tender muscles. On 09-OCT-2009 the patient recovered from tingly numbing feeling in quads. Tingly numbing feeling in quads was determined to be an important medical event based on agency requirement. Additional information has been requested.

MedDRA PT Asthenia, Dyspnoea, Fatigue

Symptom Text: Information has been received from a health professional through the HPV access program (GAP) concerning a patient who on an unspecified date was vaccinated with GARDASIL. Subsequently, the patient had an adverse experience managed well with antihistamines. Follow-up information was received from a health professional concerning a 16 year old female who on 27-MAY-2009 was vaccinated with GARDASIL (Lot# 662229/1497X) intramuscularly in the right deltoid muscle. On 27-MAY-2009, the patient also received epinephrine (Lot# 90BD229). On 27-MAY-2009 at 15:30, the patient experienced fatigue, weakness and shortness of breath. The patient was hospitalized. The patient's outcome was not reported. The reporter felt the patient's experience was related to therapy with GARDASIL. Additional information is not expected.

MedDRA PT Autoimmune hepatitis, Hepatic necrosis, Incorrect route of drug administration, Jaundice

Symptom Text: Initial case was reported as a misuse and as a serious case on 13-OCT-2009 by health authority (HA reference # FI-NAM-20090982). It was reported that a 17 year old female on an unspecified date in September 2008 was vaccinated subcutaneously with a 0.5ml dose of GARDASIL (lot#, number in series and site of administration not reported). Concomitant therapy included MERCILON beginning from 01-JAN-2009, tablet, indication of use not specified by primary reporter, a physician). The case was a misuse case as GARDASIL was administered subcutaneously instead of intramuscular administration. On 04-JUN-2009 the patient was diagnosed with icterus and liver necrosis size of 20-30. Her laboratory values in autoimmune serology including IgG value and in virus serology were normal which were examined on unspecified date(s). The patient was hospitalized on unspecified date for unspecified period. The treatment (trade name or generic name not reported) against autoimmune hepatitis was started on unspecified date. The patient gave first good response to the treatment against hepatitis but later again (on unspecified date) there was increase in values of liver enzymes and synthesis was decreased. The status of patient is suitable for either toxic or autoimmune hepatitis according to the primary reporter. There was over 6 months latency between the last dose of the vaccine and liver disease but otherwise the causality to the vaccine was possible according to the primary reporter. Patient's medical history included that on 01-JUN-2008 she was vaccinated subcutaneously with a 0.5ml dose of GARDASIL (lot#, number in series and site of administration not reported). It was reported by the primary reporter that vaccines doses were given between 2 months intervals. The total amount of vaccine administered was not reported. The MedDra coding of the case by the Health Authorities was not provided to the MA-holder. The outcome was not yet recovered defined by primary reporter. Hepatitis was also considered to a congenital anomaly. There was

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Dermatitis contact, Eye swelling, Oral pruritus, Pruritus, Rash, Swelling face

Symptom Text: My 12 year old daughter received her second Gardasil shot Wednesday, September 30, 2009. She complained of her tongue itching later that night. I started giving her Zertec. The next day she was complaining of itching on her face around her eye. I gave her Zertec twice a day until Friday night when she developed a rash on the right side of her face around her eye. At that point I started giving her Benadryl every four hours. Her face was significantly swollen on the right side by Saturday night. Sunday morning, her eye was swollen nearly shut. The right side of her face was swollen so severely, she was unrecognizable from her profile. I applied cool compresses, continued Benadryl, and gave Tylenol for the discomfort. I tried to get an after-hours appointment but was told by the on-call nurse to continue the Benadryl and that unless she had blister, there was no reason to see the doctor. Monday AM her eye was completed swollen shut, and her skin was so tightly swollen the itching had subsided. I did get her a doctor's appointment that afternoon but was told it was contact dermatitis, and that it had nothing to do with the second Gardasil shot that she had five days earlier. I asked the doctor to document the possibility that it was a reaction to the shot in her records. She said it was worth noting but that she had not seen any such reactions. (I do not believe she documented it.) She prescribed 60mg of Prednisone a day for five days and told me to continue to give her the 50 mg of Benadryl every four hours. By Monday night the very raw irritable rash had spread to the other side of her face. Tuesday the swelling on the right side had lessened but her cheek and eye were still puffy and the hives were still very raw. Tuesday night the rash had spread to cover most of the left sides of her face, behind both ears toward the back of her neck, and under her chin, down her neck and onto her chest. I continued to following doctor's instructions giving her the Benadryl and Prednisone. Wednesday morning the redness had subs

MedDRA PT Erythema, Pruritus, Urticaria, Urticaria thermal

Symptom Text: My daughter was only 10 years old when she got vaccinated with GARDASIL. She is now suffering from cold urticaria, also called cold, hives, because of GARDASIL. THis will affect her entire life. Because of this horrible side effect, she can not do many things that she used to. For example, she will not be able to be in the swimming team, because everytime she gets in the cold water she gets hives. When she goes out in the cold weather, she gets hives. The hives are red small and large bumps that itch terribly and come out all over her body, including her legs, stomach, back and arms. They last from a whole day to almost a week sometimes. I do not recommend anyone take this vaccination and a warn parents to not let their chidren doctor convince them to take it. I regret ever letting them give this shot t my daughter, but I was told it was s mandatory shot that needed to be given in order for my daughter to go to school. ```Vaccine records indicate 2nd dose of Gardasil Merck 0381X on 8/12/2009, Deltoid Rt. \ksk

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Convulsion, Immediate post-injection reaction, Loss of consciousness, Tremor

Symptom Text: Information has been received from a nurse practitioner's and an office receptionist concerning a 13 year old female patient who was vaccinated "sometime last week" with a dose of GARDASIL (Lot # not provided). Concomitant therapy included influenza virus vaccine (unspecified). Receptionist reported that the patient received a dose of GARDASIL and a dose of influenza virus vaccine (unspecified). Immediately after receiving the GARDASIL the patient passed out and had a shaking seizure which ended quickly. No ill effects since then. Upon internal review, shaking seizure was determined to be another important medical event. Additional information has been requested.

MedDRA PT Arthritis, Erythema nodosum, Lymphadenopathy

Symptom Text: Case received from a health care professional on 13-OCT-2009. It was reported by an internist that a 1992 born female patient was vaccinated with a second dose of GARDASIL (lot #, injection site and route not reported) on an unspecified date in 2008. Shortly post vaccination (no exact date reported) the patient experienced erythema nodosum, arthritis and swollen lymph nodes (not specified). A prior lymph node biopsy showed no pathologies but due to ongoing symptoms since a year, a further biopsy and diagnostic clarification were intended. The patient was vaccinated with the first dose of GARDASIL on an unknown date, toleration was not reported. Other business partner numbers include E2009-09496.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Convulsion, Electric shock, Fall, Head injury, Screaming, Syncope

Symptom Text: Information has been received from a medical assistant and medical record concerning a 14 year old former healthy female with no known allergies who on 08-OCT-2008 was vaccinated intramuscularly with a third dose of GARDASIL (lot number 659964/1978U) in the left deltoid, a second dose of VARIVAX (Merck) (lot number 661661/0995X) subcutaneously in the right arm and a second dose of HAVRIX (lot number AHA0B747AA) intramuscularly in the right deltoid. On 02-FEB-2009 at 07:47 in the morning the patient experienced syncope and was transferred to the hospital emergency room. The head CT was negative and blood sugar was 97 which was normal. The patient was diagnosed with possible electrical shock. It was reported that the patient stated that she was shocked via hair straightener. The patient saw the physician on the same day and was diagnosed with possible seizure post electrical shock. On 10-APR-2009 the patient experienced seizure for 2 minutes, fell and hit her head on the floor and was sent to ER. The patient was started with TEGRETOL 200 mg twice a day. On 25-MAY-2009 dose of TEGRETOL was increased to 400 mg twice a day then 500 mg twice a day. The patient was also treated with folic acid 5 mg daily. On 04-MAY-2009 the patient experienced seizure for the third time. On 25-MAY-2009 therapy with TEGRETOL was discontinued and changed to KEPPRA. It was reported that the patient recovered on medications on 23-SEP-2009. On 29-SEP-2009 electroencephalograpy (EEG) showed abnormal for 3 electrographic seizures. Seizures were considered to be an other important medical event by the reporter. Additional information is not expected. All available medical records will be provided upon request. 01/05/10 MR received for DOS 09/17/09. DX: Grand mal seizures. Pt presented with grand mal sz lasting 5 mins and loud screem. Pt A, Ox3, comfortable; neuro exam: normal. Pt discharged home in stable condition.

Other Meds:

Lab Data: head computed axial, 02/02/09, negative; electroencephalograpy, 09/29/09, an abnormal EEG due to the presence of three electrographic seizures; blood glucose, 02/02/09, 97, normal DX studies: ECG: asymptomatic; GCS: 14; Head CT: normal.

History: PMH: seizures; Allergies: NKDA.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Condition aggravated, Convulsion, Gaze palsy, Injection site pain, Muscle rigidity, Syncope

Symptom Text: Information has been received from a physician concerning a 14 year old female with convulsion who on 15-OCT-2009 was vaccinated with GARDASIL. Concomitant therapy included KEPPRA. On 15-OCT-2009 the patient experienced pain at injection site and seizure 30 seconds after the vaccination was received. The physician was convinced that it is a seizure rather than twitching associated with syncope due to stiffening of extremities and upward rolling of the eyeballs. On 15-OCT-2009, the patient recovered from seizure before leaving the physician's clinic. The physician felt that seizure was not related to therapy with GARDASIL, as it is "probably more related to the pain". Upon internal medical review, seizure was considered an important medical event. No further information is available.

Other Meds: KEPPRA

MedDRA PT Computerised tomogram normal, Cranial nerve disorder, Diplopia, Nuclear magnetic resonance imaging normal, Paresis, Scan brain, Visual acuity tests normal

Symptom Text: Information has been received from a Health Agency concerning a 14 year old female patient who received the first dose of GARDASIL (batch number not reported) via IM route at the end of February 2008 (exact date not provided). On 27-APR-2008, approximately two months after vaccination, a diplopia abruptly appeared for which she consulted. Cerebral CT scan was normal. A fluctuant monocular oblique diplopia in relation with a paresis of the right superior oblique was observed. MRI performed on 24-MAY-2008 was normal. Visual acuity was normal (10/10e). On 16-JUN-2008, diplopia was still present. Decompensation of a trochlear nerve was considered. At the time of reporting the outcome was unknown. The reporting Health Agency considered that diplopia and cranial nerve disorder NOS were medically significant as other important medical events. The Health Authority assessed the causal relationship between the reported reactions and vaccination as "doubtful" according to the method of assessment. Other business agreement numbers included: E2009-09449. No further information is available.

MedDRA PT Multiple sclerosis, Syncope

Symptom Text: My daughter received GARDASIL on 10/04/2007 and was diagnosed within 6 months with vasovagal syncope and Multiple Sclerosis. She was 16yrs old at her diagnosis and many doctors have commented on how young she was to be diagnosed. After researching the H1N1v vax and its possible side effects, it sparked conversations of other vaccines and side effects. I spoke with my sister who is a dr of pharm and she suggested reporting our situation to the FDA. I also did some further looking into reports of GARDASIL and MS and instances have been reported. I this this could be a valid concern.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Thrombosis, Vaginal haemorrhage

Symptom Text: Information has been received from a physician concerning a 28 year old female history of 2 pregnancies and 1 live birth who on 14-FEB-2007 was vaccinated with the first dose of GARDASIL. On 13-APR-2007 (2 weeks, 3 days prior to last normal menstrual period), the patient was vaccinated with the second dose of the vaccine. On 1-MAY-2007, the patient had her "last normal menstrual period". Eight weeks after LNMP, on approximately 1-JUL-2007, the patient started bleeding for days with clots- the patient had a miscarriage. Subsequently, in July 2007, the patient recovered from the miscarriage. On 21-JUL-2007, the patient experienced menstruation again (last menstrual period). Subsequently, the patient became pregnant (refer to WAES#0907MYS00009). The reporter felt that miscarriage was not related to therapy with GARDASIL. The cause of the miscarriage is not known. Upon internal review, miscarriage was considered an important medical event. No further information is available.

MedDRA PT Arthralgia, Blood pressure abnormal, Computerised tomogram normal, Dyspnoea, Echocardiogram normal, Feeling of body temperature change, Myalgia, Paraesthesia, Pulse abnormal, Tachycardia, Ultrasound Doppler normal

Symptom Text: Information has been received from a consumer concerning her daughter, an 18 year old female without pertinent medical history and allergies to Cecore, amoxicillin and sulpha who was vaccinated with a dose of GARDASIL in May or June 2009 and "about 5 weeks ago" approximately on 07-SEP-2009 respectively. Concomitant therapy included YASMIN, CYMBALTA and ADDERALL. The reporter mentioned that on approximately 14-SEP-2009 "4 weeks ago" after the patient received the second dose of GARDASIL she started experiencing difficulty breathing and tingling sensations in her arms and legs. It was also reported that "about a week ago" approximately on 07-SEP-2009 the patient was hospitalized for 24 hours because her blood pressure and her pulse were erratic (pulse at 150 to 160). The reporter mentioned that her daughter was still having tingling, as well as joint and muscle pain and she does seem to able to get in a comfortable body temperature (she was either cold or really hot). The patient sought unspecified medical attention. Follow-up information was received from an office Manager who reported that the patient received on 20-MAY-2009 the first dose of GARDASIL (Lot # 661953/1130X) and on 26-AUG-2009 the second dose of GARDASIL (Lot # 661952/1129X). The reporter also mentioned that the patient did not receive any concomitant vaccinations when the GARDASIL vaccinations were administered. Additional information has been requested. 10/29/09: Emergency Department records received for date of service 10/5/09. Dx: Narrow complex tachycardia Assessment: Presents with dyspnea, described as mild. No cough, sputum production, fever or chills. No chest pain or discomfort. Tachycardic. Pleural effusion and pulmonary embolism ruled out. Admitted to hospital.

Other Meds: ADDERALL TABLETS; YASMIN; CYMBALTA

Lab Data: pulse oximetry, 150 to 160 10/29/09: Emergency Department records received for date of service 10/5/09. Labs and Diagnostics: CT: No CT evidence of pulmonary embolism. Transthroacic Echocardiogram: Normal left ventricular size and

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abasia, Conversion disorder, Heart rate irregular, Migraine, Muscle spasms, Nausea, Rash erythematous, Syncope, Tremor, Weight decreased

Symptom Text: It was reported in a newspaper article that an 18 year old formerly healthy female who on an unspecified date was vaccinated with a second dose of GARDASIL (lot number, injection site and route not reported). Subsequently the patient experienced migraine-type headache fainting episode after the first two shots but did not consider it as possible side effect. On an unknown date, the patient was vaccinated with a third dose of GARDASIL (lot number, injection site and route not reported). The patient experienced CHARLEY-HORSE-type pain in her right leg led to spasms and tremors, an irregular heartbeat and nausea so severe that she lost 15 pounds in one month and had to go on intravenous fluids. The patient also developed a red rash on her upper body around the same time. The patient went to see the physician, and the physician told her that she had a "conversion disorder", in which stress caused physiological symptoms. The patient reported that her ailments had been getting worse for months, ever since she got her third GARDASIL shot. The patient felt that her adverse events were related to therapy with GARDASIL but most of her physician did not consider GARDASIL a possible cause. The patient though that fainting episode eventually disabled her. The patient reported that " I have not walked in six months". This is one of several reports from the same source. No further information is available.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Activities of daily living impaired, Chronic fatigue syndrome, Dyspepsia, Hypoaesthesia, Muscle spasms, Myalgia, Nausea, Pain, Paralysis, Rash

Symptom Text: It was reported in a newspaper article that a 17 year old female who on 09 February (year unknown) was vaccinated with a dose of GARDASIL (lot number, injection site and route not reported) and a dose of MENACTRA. Subsequently the patient experienced digestive problems, rashes, severe muscle pain. The patient's mother reported that the patient was in pain every day. The patient had to drop out of a major skating competition because she can no longer land jumps or handle a four-minute routine. The patient was seen by several physicians. The patient agreed that something catastrophic must have happened to cause the extreme nausea that put the patient on acid blockers, the muscle pain that at one time required morphine, and that "roaming paralysis" that sometimes cramped her hands into claws and numbed her feet. Finally, in April, a rheumatologist wrote that the patient most likely was suffering from positive fatigue syndrome. Without explaining, the rheumatologist wrote that "it was possible" but "not very likely" that the patient's Feb, 9 GARDASIL and MENACTRA immunizations triggered the symptoms. The patient's mother was convinced that GARDASIL caused her daughter's symptoms. Upon internal review, paralysis was determined to be an other important medical event. This is one of several reports from the same source. No further information is available.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a consumer for the Pregnancy Registry for GARDASIL, concerning a 25 year old female with no drug reactions/drug allergies reported and no pertinent medical history, who on 17-JUL-2009 was vaccinated IM with 0.5 ml first dose GARDASIL (lot number not reported). Concomitant therapy included Omeprazole. The patient stated she came pregnant after getting her first dose of GARDASIL, she was " 1 month or 5 weeks pregnant". When asked she verified that she was not pregnant at the time of vaccination. The patient did not have any regular doctor. No laboratory tests were performed. No adverse event reported. The patient sought unspecified medical attention. Follow up information has been received from a consumer who stated that she received one injection, she lost the baby and she was pregnant again (WAES 0910USA03215). At the time of this report the patient's outcome was unknown. Upon internal review, to lose a baby/abortion was determined to be an other important medical event. Additional information has been requested.

Seriousness: EXTENDED HOSPITAL STAY, HOSPITALIZED, SERIOUS

MedDRA PT Convulsion, Loss of consciousness, Urinary incontinence

Symptom Text: Information has been received from a physician concerning a 13 year old female patient without a pertinent medical history or drug reactions/allergies who on 15-OCT-2009 was intramuscularly vaccinated her first 0.5 ml dose of GARDASIL (Lot # 661703/0651X). Secondary suspect vaccine included FLUMIST (Lot # 500723P). The reporter mentioned that a Nurse first administered on 15-OCT-2009 FLUMIST and when they were giving the patient GARDASIL, the patient passed out and had what they described a seizure. It was reported that the patient urinated on herself. According to the physician the patient was admitted into hospital and she was observed for 24 hours and then discharged. Also was reported that the patient was diagnosed with seizures. The Nurse at the Doctor's office did not believe the adverse experience was caused by GARDASIL. No laboratory or test diagnostics were performed. The patient recovered after stopping therapy on an unspecified date. As a final statement the physician mentioned that the patient had "one episode like that previously within the last couple of years while at school" and the patient was not being given any medications or vaccination when that happened previously. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Headache, Hypoaesthesia

Symptom Text: Information has been received from a physician via CSL as part of a business agreement (manufacturer control number 20090907JV2) concerning a 25 year old patient who on 15-MAY-2009 was vaccinated with the first dose of GARDASIL (lot number not reported). On 16-MAY-2009 the patient developed headache and left side numbness without weakness. The patient's vision was normal. The patient was transferred to a hospital Emergency Department. Head computed axial tomography (CT) was performed and the result was normal. Magnetic resonance imaging (MRI) was performed and the result was normal. The patient was diagnosed with questionable migraine. It was noted that the symptoms lasted for a few hours and got better on its own. The patient was discharged home. The patient was not given the second dose of GARDASIL. Follow-up information has been received from the physician concerning the 25 year old female patient. On 15-MAY-2009 (previously reported as 16-MAY-2009) the patient developed headache, numbness on the left side and was hospitalised. On 16-MAY-2009 Head CT and MRI were performed and nothing abnormal detected. On an unspecified date, the patient recovered. No further information is available.

MedDRA PT Disturbance in attention, Dizziness, Fatigue, Headache, Vaccination complication

Symptom Text: Information has been received from a physician concerning a female patient who on approximately 12-AUG-2009, "three weeks ago", was vaccinated intramuscularly into the deltoid with a dose of GARDASIL. The next morning after vaccination, on approximately 13-AUG-2009, the patient had experienced headaches and dizziness every day for the last three weeks. The patient also had not been able to concentrate in school. The patient sought medical attention by an office visit. The patient recovered from all symptoms on 02-SEP-2009. Follow up information was received from the physician who reported that the 14 year old patient on 18-AUG-2009 was vaccinated with her first dose of GARDASIL (Lot No. 663452/0671Y). On 19-AUG-2009, the patient experienced severe headache and dizziness. The patient was prescribed ANTIVERT for the treatment of dizziness. Although the patient was going to school, she was very tired and had difficulty concentrating. The patient sought unspecified medical attention. At the time of the report, the patient had recovered from all symptoms. The patient's headache, dizziness, disturbance in attention, and fatigue were considered to be other important medical events by the reporter. No further information is available. 11/2/09 Medical records received for date 9/2/09. DX: Adverse rx to vaccine. Presenting SX: c/o severe HA, dizziness x3wks. Pt states began after first vax of gardasil.

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Injected limb mobility decreased, Injection site pain, Injection site swelling, Injection site warmth, Pain, Sleep disorder

Symptom Text: Information has been received from a physician concerning a 25 year old female patient, with no allergies who on 05-OCT-2009 was vaccinated a 0.5 mL dose of with GARDASIL, intramuscular route (lot # unknown). Concomitant therapy included ORTHO TRI-CYCLEN. On 05-OCT-2009 the patient noticed tenderness in her shoulder after GARDASIL had been administered in her left deltoid. She experienced severe pain for 2 days, then persistent pain to the present day. The physician reported that there was a tender, hot, swollen area 3 cm at injection site where the pain extended to her shoulder begins. The physician considered it a mild or partial disability because the patient found difficult even to raise arm to put on a T-shirt and she was having problems sleeping. The patient has been treated with an unspecified anti inflammatory with no relief, she was just started on CIPRO and LORTAB and directed to apply heat. The patient sought medical attention at the physician's office. At the time of this report the patient's outcome was unknown. Additional information has been requested.

MedDRA PT Type 1 diabetes mellitus

Symptom Text: Information has been received from Health Authority (case# 104830) through a foreign agency (local case# IT431/09) concerning a 12 year old female patient with no medical history who on 05-MAR-2009 was vaccinated with the first dose of GARDASIL (lot# 1864U, batch# NJ16970) intramuscularly. On 13-MAR-2009 the patient experienced type 1 diabetes mellitus and was hospitalized. The elevated value of the glycosilate hemoglobin (13.1) indicated that the disease had been active since a few months. The patient had not yet recovered. The case is closed. Other business partner number included: E200909862. Additional information has been requested.

MedDRA PT Acute disseminated encephalomyelitis, Facial palsy, No reaction on previous exposure to drug, Sensory loss

Symptom Text: Case received from a general practitioner on 16-OCT-2009: On 13-OCT-2009 in the evening, a 21 year old female patient had received the third dose of GARDASIL vaccine (batch # NH42160, lot # 1535U). On 14-OCT-2009 in the morning, she developed sensitivity disorder on the left hemicorpus. She found it difficult to whistle and she had the feeling that her smile was not normal. On 15-OCT-2009 everything was normal. On 16-OCT-2009 in the morning, there was a recurrence with a stronger sensation. She experienced facial paralysis with sensitivity disorder at the level of the left shoulder. An MRI was performed which showed a post-vaccinal acute disseminated encephalomyelitis. The patient was hospitalized to have neurological examination and lumbar punction. There was no associated sign. In particular, there was no mental deterioration, nor behaviour disorder. The patient was concomitantly taking a contraceptive pill. The first and second doses of GARDASIL vaccine had been well tolerated. Furthermore, she had also well tolerated her childhood vaccinations and hepatitis B vaccine that she had received in 2006. To be noted that her sister had experienced Kawasaki's disease during her childhood. It's noteworthy that the reporter doubted that the event was linked to the vaccine. At the time of reporting, the outcome was not provided. Other business partner numbers included: E2009-09686.

Other Meds: Hormonal contraceptives (unspecified)

Lab Data: magnetic resonance imaging, 16?Oct09, a post-vaccinal acute disseminated encephalomyelitis

MedDRA PT Condition aggravated, Idiopathic thrombocytopenic purpura

Symptom Text: Case received from a health care professional on 22-OCT-2009. Information has been received from a nurse concerning her adolescent daughter with no other relevant medical history who on an unspecified date was vaccinated with the first dose of GARDASIL (lot#, route and site of administration not reported). Unspecified time post vaccination laboratory values (not specified) showed thrombocytopenia (reported term: "slight signs of ITP"). After the second dose of GARDASIL (lot#, route, date and site of administration not reported) symptoms aggravated. Diagnosis of idiopathic thrombocytopenia was established. The patient was hospitalized. At the time of this report, the patient's outcome was unknown. The reporter felt that idiopathic thrombocytopenia and condition aggravated were related to GARDASIL. Other business partner numbers include: E2009-09932. Additional information has been requested.

MedDRA PT Anxiety, Dyskinesia, Fall, Feeling hot, Immediate post-injection reaction, Nausea, Nervousness, Pallor

Symptom Text: Immediately follow administration of 2nd vaccine(Hep A) child slumped forward with jerking motions of upper and lower extremeties for 3-5 seconds. Child then lifted head up with PHN asking child name and place. Child answered appropriately. She was pale, c/o being hot and feeling nauseated. PHN lay child on bed, applied cool cloth and fanned. Called Dr. Hensleigh's office and child carried to MD for evaluation. Child and child's mother returned to Clinic approximately 30 to 45 minutes later stating that Dr. Hensleigh evaluated and determined that this occurred due to child was very nervous and apprehensive before injections. No other problems occurred and child went to school the following day, 10/29/2009. PHN called to check on child again on 10/30/2009 with mother stating child having no further problems after leaving clinic the day vaccines given, 10/28/09.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Activities of daily living impaired, Angiogram normal, Headache, Migraine, Nuclear magnetic resonance imaging normal, Syncope, Thyroid function test normal

Symptom Text: Information has been received from a pharmacist concerning a 16 year old female patient with no pertinent medical history, who had received a dose of GARDASIL (dose, batch number not reported) approximately 6 months before this report (approximately in April 2009). Five days after vaccination, she experienced a syncope, which increasingly recurred. The patient had a scan, consulted a pneumologist and a cardiologist (date unspecified). Work-ups for cardiology were normal. The patient was hospitalized and had been off school for the last three months. No diagnosis was established. At the time of the report the outcome was not provided. Additional information was received through telephone call to the pharmacist on 28-OCT-209. The syncope was due to headaches, also reported as migraines and very severe. The events started after the second dose of GARDASIL, (lot number and batch number not reported). The patient was concomitantly taking a contraceptive pill that was stopped at the beginning of the symptoms. She was actually taking DOLIPRANE for her migraines, but it had no suppressive effect. MRI and angiography were normal. Thyroid work-up was normal too. The patient under went a session of hypnosis which was followed by period of 24 hours without symptoms. It was planned to put ear aerating device to test if the patient was suffering from undetected secretory otitis media. To be noted that the patient had experienced multiple otitis during her childhood. There was no history of migraine in her family. Other business partner numbers included E2009-09953. No further information is available.

MedDRA PT Non-Hodgkins lymphoma

Symptom Text: Information has been received from a registered nurse concerning her approximately 16 year old sister in law's daughter who on an unspecified date was vaccinated with a dose of GARDASIL (Lot number unspecified). The registered nurse reported that the patient was diagnosed with Non-Hodgkin's lymphoma after vaccination with GARDASIL. At the time of the report the status of the patient was unspecified. The patient sought medical attention. Upon internal review, Non'Hodgkin's lymphoma is considered to be an other important medical event. All telephone attempts to obtain follow-up information have been unsuccessful. Additional information has been requested.

MedDRA PT Coma, Neurological symptom

Symptom Text: Information has been received from a physician who heard from a Nurse concerning a young female who was vaccinated on an unspecified date with GARDASIL (Lot number was not available). The reporter stated that the patient experienced neurological side effects and entered a coma for a length of time after receiving GARDASIL. It also was stated that the patient "had gone through a lot of things but they felt it was from GARDASIL because of process of elimination". It was reported that "unspecified test" were performed on an unknown dates. The reporter mentioned that the patient was hospitalized for an unspecified length of time. At the time of reporting the patient had not recovered. "Attempts are being made to verify the existence of an identifiable patient". Additional information had been requested. Patient was hospitalized.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Failed induction of labour, Pre-eclampsia

Symptom Text: Information has been received from a physician for GARDASIL, a Pregnancy Registry product, concerning a 20 year old female with a history of polycystic ovarian syndrome who on 15-APR-2008 was vaccinated IM with the first dose of GARDASIL (655327/1287U). Concomitant therapy included PROMETRIUM and Metformin. The physician reported that the patient is pregnant (LMP = 23-MAR-2008) and that gestation is 2 days prior to vaccination. The patient sought unspecified medical attention in the physician's office. Prenatal labs were performed; results were normal. No adverse effects were reported. Patient outcome was not reported. Follow up information was received from a health professional who initially reported that the patient had a pregnancy and delivery with "no complications". The health professional later stated, "that the patient was not without complications since the patient had pre-eclampsia and also had a cesarean section." Follow up information was received from the physician who stated that the patient had a healthy and normal male, with no congenital anomalies. He was born full-term and weighed 6lb, 8oz. Additionally, the patient had a history of chronic hypertension and developed pre-eclampsia, for which she was induced at 37 weeks gestation. Her induction failed and as a result the patient had a cesarean section, from which she has recovered "just fine". At the time of the report the patient was pregnant again. Upon internal review cesarean section was considered to be an other important medical event. Additional information is not expected.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Cervical dysplasia, Papilloma viral infection, Surgery, Vaccination failure

Symptom Text: Information has been received from a physician concerning a 19 year old female patient with penicillin allergy who was vaccinated intramuscularly with 3 doses (0.5ml each one) of GARDASIL on 31-JAN-2008 (lot #659962/0571X) respectively. The physician reported that the patient had a PAP smear that was positive to all 4 types of GARDASIL. Prior to starting the GARDASIL vaccine the patient had a PAP smear that was negative to all 4 types of GARDASIL (date not reported). A biopsy from a PAP smear was done on 18-DEC-2008 showed the patient has 13 high risk types of HPV and 5 low risk types of HPV, this information came from the patient's obstetrics and gynecology physician. Also performed were "serologic test for other sexually transmitted diseases" but the results were not reported. The patient sought medical attention in the office visit. The outcome was reported as not recovered. Follow-up information was received from a physician via medical records. It was reported that the patient with a history of unspecified vaginitis and vulvovaginitis was vaccinated into the right arm with the first dose of GARDASIL (lot # 659962/1740U) on 31-JAN-2008 at 10:00, with the second dose of GARDASIL (lot # 659962/1740U) into the left arm on 15-MAR-2008 at 10:00 and with the third dose of GARDASIL (lot # 659962/0571X) into the right arm on 04-AUG-2008 at 10:30 respectively. The physician reported that the patient had a PAP smear that was positive for multiple papillomas strains of HPV; including the ones in the vaccine. The pap sample collected on 18-DEC-2008 was sent for HPV testing and results reported on 29-DEC-2008. The patient's test results were reported as (patient had Pap IG, HPV-h+Ir) Epithelial cell abnormality, atypical squamous cells of undetermined significance. HPV results: HPV, high-risk: positive; HPV low-risk: negative. The physician reported that event required medical/surgical intervention. Additional information was received from the physician. It was reported that the physician felt that "the vaccine did not wo

MedDRA PT Drug exposure during pregnancy

Symptom Text: LPN calls FBVHC on 29OCT09 re 23 y/o AD female SM who inadvertently received GARDASIL vaccine on 30SEP09 and the Live Intranasal Flumist vaccine on 08OCT09 before the SM knew she was pregnant. As of 29OCT09, when the SM's OB Intake/Registration was performed the SM was at 6 weeks, 3 days gestation / LMP 12SEP09 / EDC 19JUN2010. Age at first pregnancy: 20 years. Gravida 3, para 0 and 2 abortions/miscarrages one at 9 weeks and one at 5 months. No previous ectopic pregnancies. No h/o congenital malformations. No DES taken during pregnancy. Baby's father is 24 y/o. The SM currently denies any evidence of adverse events following immunizations received no spotting, cramping, pelvic or abdominal pain reported. Denies N or V. NKDA. The SM is scheduled to be seen at OB-GYN on 07DEC09 for specialty consult s/p vaccine exposure as noted above. SM advised to notify PCM of any new onset of spotting, pelvic or abdominal cramping or pain. Intractable N or B fever > 101F or any other changes in health status. FBVHC provided patient with online resources for MERCK GARDISIL PREGNANCY REGISTRY and will F/U with SM periodically throughout pregnancy to inquire re progress and reporting of any adverse events up through the delivery of the baby. Symptoms: Amenorthea.

Other Meds: Prenatal Vitamins w/ Ferrous Fumarate 28mg & Folic Acid 0.8mg.

MedDRA PT Abortion induced, Drug exposure during pregnancy, Fatigue, Myalgia, Nausea, Pain, Vomiting

Symptom Text: Information has been received from a medical assistant, for GARDASIL, a Pregnancy Registry product, concerning a 22 year old female with penicillin allergy who on 05-DEC-2008 was vaccinated with the first dose of GARDASIL (lot number unspecified). On 03-FEB-2009 the patient received the second dose of GARDASIL (lot number unspecified). On 10-JUL-2009 the patient received the third dose of GARDASIL (lot number: 661846/1312X, 0.5ml, IM. There was no concomitant medication. The patient's last documented period was 3 months ago, in approximately April 2009; however, the patient had sporadic periods. On 23-JUL-2009, the patient was seen in the office for symptoms of body aches, fatigue, nausea, vomiting and myalgia. On 23-JUL-2009 a urine pregnancy test was conducted and the result was positive for pregnancy. HCG quantitative test was ongoing (result unknown). The patient's estimated delivery date would be on 28-JAN-2010. At the report time the patient was pregnant. Follow up information has been received from a medical assistant concerning the 22 year old female who was vaccinated with 3 doses of GARDASIL on 05-DEC-2008, 03-FEB-2009 and 10-JUL-2009 respectively. The reporter noted that the patient terminated pregnancy on an unspecified date. The patient last menstrual period was on 27-APR-2009. The estimated delivery date (EDD) would be on 01-FEB-2010. At the time of the report, the outcome was unknown. No further information is available.

MedDRA PT Aphasia, Blood pressure decreased, Grand mal convulsion, Intensive care

Symptom Text: Information has been received from a physician concerning a female, without any allergy in medical history, who on 30-OCT-2009 was vaccinated with the first dose of GARDASIL. Concomitant therapy included THERAFLU. About 30 minutes after vaccination the patient experienced blood pressure decreased. About one hour after vaccination the patient experienced tonoclonic convulsions. The patient was admitted to the hospital (intensive care unit). The patient was conscious, she understand everything, she could write, but she could not talk (she experienced aphasia). The patient's tonoclonic convulsions and aphasia persisted. The reporter felt that blood pressure decreased, tonoclonic convulsions and aphasia were related to therapy with GARDASIL. Upon internal review tonoclonic convulsions were determined to be an other important medical event. Additional information has been requested.

MedDRA PT Amnesia, Asthenia, Confusional state, Hypertonia, Muscle rigidity, Petit mal epilepsy

Symptom Text: Case received by Health Authority (case # 104968) through (local case # IT434/09). Initial report received on 22-OCT-2009. Information has been received from a health authority concerning an 11 year old female patient with no medical history for intolerance and/or disease who on 17-SEP-2009 was vaccinated intramuscularly with the first dose of GARDASIL (batch# NK19200, lot# NJ29430). There were no drugs or vaccines administered during the 4 weeks prior to vaccination. On the same day, a few minutes post vaccination, the patient developed rigidity with hypertonia that lasted a few seconds, accompanied by apparent state of absence and asthenia, sub-confusional state and complete amnesia about the event. Health authority only code "absence seizure". She was laid supine with her legs raised. The event resolved spontaneously on 17-SEP-2009. The case was reported as not serious by both the reporter and the health authority and was updated to serious (other important medical event) by company upon medical review. The case is closed. Other business partner numbers included: E2009-09922. No further information is available.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT No reaction on previous exposure to drug, Rash maculo-papular

Symptom Text: Information has been received from Health Authorities (reference # C200909-1137) concerning a 17 year old female with no previous adverse reactions to GARDASIL and other drugs, who in June 2009 was vaccinated with a dose of GARDASIL (batch # not reported) IM. Five days after vaccination, the patient developed a maculo-papular exanthema which resolved after 10 days. The drug was suspended and the patient was given oral anti-histamines and topical corticosteroids as corrective treatment. To be noted that the case was received as a follow-up by the Health Authorities, although the initial version had not been received. Furthermore, after the meeting of the unit, the case was updated to serious by the Health Authorities (follow-up consisted in upgrading). At the time of the report, the patient had recovered. Maculo-papular exanthema was considered to be an other important medical event. Other business partner numbers included E2009-10100. Additional information is not expected.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Aggression, Amnesia, Asthma, Convulsion, Disorientation, Dizziness, Fatigue, Flat affect, Incoherent, Incontinence, Lacrimation increased, Unresponsive to stimuli

Symptom Text: Started passing out at school, incoherent and did not recognize people. Was taken to hospital emergency complete blood work including drug testing done, all came back negative. CAT scan done came back negative. Unable to recognize family member that came to hospital and friends. While in hospital she had what we now know 3 seizures. She becomes completely quiet, tears running down face and does not respond to any one. They released her saying it was a reaction to her asthma inhaler. Went to pediatrician next day who thought it may be drugs but drug panel at hospital was negative. Her personality completely changed went from outgoing and friendly, to quiet and tired. On Wednesday September 5 she returned to the pediatrician who suggested she see a specialist she suspected patient was having seizures and her memory had still not returned. Started seeing Dr. on Sept. 6 and he confirmed seizures put on meds. After seizures she becomes very aggravated and mean then take a nap that can last anywhere from a couple hours to all day. There were 2 occasions she lost control of her bodily functions. In October she started have short term memory loss and would ask the same question over and over again. She was taken out of school and put on hospital/home studies for the remainder of her sophmore year. She was taken off all med in the spring of 2008 and her last seizure was in Nov of 2008. 12/16/09 Medical records received for dates 9/16/07 to 3/14/08. DX: seizures. Multiple f/u appts for seizure monitoring. Pt w/ active seizure disorder. 12/17/09 ER records received for date 8/30/07. DX not documented. SX: c/o asthma attack, parents states pt not acting right since the asthma attack. Assessment: flat affect, disoriented. 1/4/2010 Ed note for 9/20/2007, patient with c/o's dizziness, no tx noted,

MedDRA PT Death, Drug exposure during pregnancy, Foetal disorder, Premature labour, Stillbirth

Symptom Text: Information has been received from a 22 year old female with a history of precancerous cells present (caused by HPV) in 2004 and partial cervicectomy who in approximately January 2008, was vaccinated with the first dose of GARDASIL, lot # not available. In approximately March 2008, the patient was vaccinated with the second dose of GARDASIL, lot # not available. In July 2008 the patient found out she was pregnant. In September 2008 the patient was vaccinated with the third dose of GARDASIL, lot # not available (on the recommendation of her physician). In approximately January 2009 the patient went into premature labor (at 23 and a half weeks gestation) and her son was still born. Upon internal review, 23 and a half weeks gestation and stillbirth were considered to be other important medical events. No further information is available. This is one of several reports received from the same source.

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Conversion disorder, Convulsion, Fall, Fatigue, Headache, Hyperventilation, Hypoaesthesia, Hypotension, Pain, Paraesthesia, Paraesthesia oral, Presyncope, Syncope, Tremor

Symptom Text: Patient came to parent reporting numbness and tingling of legs/feet. She fell to the ground and begin seizing. Her aunt, a nurse manager, recognized the symptoms of a seizure and accompanied parent to the ER. She was transported to another hospital and hospitalized 10/05-10/10/2009. Patient has continued to have unexplained seizures since that time. Other symptoms include: low blood pressure, headache, fatigue, hyperventilation, achy and shaky legs. 11/13/09: Discharge summary and hospital records received for dates of service 10/8/09 to 10/13/09. Dx: Psychogenic nonepileptic seizures. Assessment: Presented with episodes of lightheadedness, dizziness, near syncopy or syncopy, numbness of legs & feet, feelings of her lips tingling as well as episodes of hyperventilation. Eventually sx. increased to loss of awareness and seizure-type activity. Seen in the ED 3 times in 24 hrs. prior to admission for apparent seizure activity. Admitted to ICU for observation. Video EEG noted several events judged nonepileptic in nature. The apparent seizures were determined to be a conversion disorder. Pt. discharged to home with instructions to stay home from school, not drive, and to be supervised when bathing. 11/23/09 Hosp. records received for date 10/8/09. DX: Seizure vs pseudoseizure. Presenting SX in ER: active seizure several episodes, upper body shaking, crying. MD witnessed episode, no LOC. Pt. seen in ER 10/7/09 for episodes of hyperventilation. ICD9 codes: 786.01, 780.39, 782.0

MedDRA PT Convulsion

Symptom Text: Information has been received from a consumer via internet newspaper concerning her daughter, who on an unspecified date was vaccinated with a dose of GARDASIL. Subsequently the patient was suffering for seizures, a problem her parents were convinced was a result of GARDASIL "shots". It was stated that the Centers for Disease Control stand behind the vaccine, as a safe way to prevent cases of cervical cancer that health officials insist will otherwise kill thousands of women. At the time of the report the patient's outcome was unknown. It was unknown if the patient sought medical attention. Upon internal review seizures was considered to be an other important medical event. This is one of several reports from the same source. Additional information is not expected.

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abdominal discomfort, Activities of daily living impaired, Dehydration, Dizziness, Fatigue, Headache, Inappropriate schedule of drug administration, Influenza like illness, Photophobia, Pyrexia, Somnolence

Symptom Text: Information has been received from a physician and a registered nurse concerning an 18 year old female patient with shoulder injury who on 02-SEP-2008 was vaccinated with the first dose of GARDASIL (lot # 661530/0575X) and on 14-OCT-2009 received the second dose of GARDASIL (663452/0671Y). There was no concomitant therapy. On 15-OCT-2009, the next day after vaccination, the patient complained of headache, fever and general fatigue. The fever went away after about a day. The headache persisted. It was reported that there was stomach discomfort as well. On an unspecified date, the patient ended up being treated at urgent care with IV fluids for dehydration and IV TORADOL for headache. The physician stated that the patient has been out of school for this entire time and unable to drive because of dizziness and light sensitivity to the eyes. On 27-OCT-2009, the patient called to the office because she thought that she was sick with flu like symptoms. The physician also stated that the patient was debilitated and that she was sleeping 8 to 10 hours a day. It was also reported that the patient could not drive or do anymore of her normal activities. This had been ongoing for 2 weeks as of 28-OCT-2009. No laboratory or diagnostic tests were performed. At the time of reporting the patient was on around the clock pain relievers. Upon internal review the patient's experiences were considered to be disabling. Additional information has been requested.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Arthralgia, Erythema, Pruritus, Rash

Symptom Text: Information has been received from a consumer via CSL as part of a business agreement (manufacturer control #20091030KH2) concerning a 25 year old female patient with polycystic ovarian syndrome who on 02-Jul-2007 was vaccinated with the first dose of GARDASIL, on 28-Sep-2007, received her second dose of GARDASIL and on 12-Mar-2008 received her third dose of GARDASIL (Lot numbers not reported). There was on concomitant medication. In approximately January 2008 (reported as beginning of 2008), the patient experienced itchiness and red spots/rash near scalp between cheeks and eyes (developed itchiness and red spots on forehead and underneath eyes) after the administration of GARDASIL. The itchiness went away but redness remained after a while. The patient also experienced joint pain in ankles and wrists. In the beginning of 2009 an arthritis test was done and the results were normal. At the time of reporting on 30-Oct-2009, the patient's joint pain in ankles and wrists and itchiness and red spots persisted. The patient had many treatments, not specified, to no avail. The reporter felt that there was a reasonable possibility that joint pain in ankles and wrists, itchiness and red spots were caused by the therapy with GARDASIL. Joint pain in ankles and wrists were considered to be disabling as it impeded her everyday life. Joint pain in ankles and wrists, itchiness and red spots were considered as other important medical events by the reporter. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Autoimmune disorder, Joint swelling, Oedema peripheral, Psoriatic arthropathy

Symptom Text: Patient had vaccines on 12/17/2008, 2/23/2009, and 6/23/2009 and began experiencing a swollen finger in 5/2009. This proceeded over the next few months to her finger joints and down her tendon to her wrist. She is diagnosed with psoriatic arthritis because of her inflammation of joint and tendon (tenosynovitis) in her left hand. They want to treat her with methotrexate to attack this auto-immune disorder. 11/23/09 Medical records received for date 5/28/09. DX: left middle finger tenosynovitis. Pt presented w/ c/o left mid. finger swelling, unable to recall any injury. OV 8/4/09 Cont. c/o swelling left mid. finger no extends to palm of hand. Ref. to ortho.

Other Meds: Received tetanus shot and 1st dose of Gardasil on 12/17/2008. Received second dose of Gardasil on 2/23/2009 and third dose on 6/23/2009. Took Advil from May to June to try and decrease swelling of tendon and joint in finger.

Lab Data: MRI shows tenosynovitis, hospital has run many blood tests and x-rays. Visits to 2 orthopedic surgeons, 1 rheumatoid arthritis doctor, and 1 eye surgeon.

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Abnormal labour, Blood pressure increased, Blood test, Caesarean section, Chorioamnionitis, Drug exposure during pregnancy, Induced labour, Packed red blood cell transfusion, Postpartum haemorrhage, Pre-eclampsia

Symptom Text: Information has been received from a mother, for the Pregnancy Registry for GARDASIL, concerning her daughter, a 17 year old female with a history of antibiotic therapy and no known drug reactions/allergies, who on 22-APR-2008 was vaccinated (route unknown) with a 0.5 mL first dose of GARDASIL (Lot # unknown). Concomitant therapy included (BACTRIM, also reported as "Bectrum"). The mother reported the pregnancy for her daughter. The patient was administered with the first dose on 22-APR-2008 and as of 3-May-2008 she is 5 weeks pregnant (LMP "March 2008"). The lot # is not provided. No AE involved. A blood test was performed. Unspecified medical attention was sought. No product quality complaint was involved. Follow up information was received from the nurse who indicated that on approximately 23-DEC-2008 the patient had an induction of labor after she came into the office with some contractions and elevated blood pressure (bp). During the induction the patient "quit dilating" and at 38 +2/7 weeks had a Cesarean section. On 23-DEC-2008 the patient delivered a normal baby, with Apgars values of 8 and 9 at 1 and 5 minutes respectively and only required a bulb syringe suctioning, "but no further resuscitation", the nurse also reported "everything looked good" with the baby. The patient also had a postpartum hemorrhage, and was transfused two units of packed red blood cells. Post-operatively the diagnosis was pre-eclampsia and chorioamnionitis. She also received antibiotics (unspecified) for the chorioamnionitis. The nurse also reported that the baby had a sepsis workup due to the mother's chorioamnionitis, but he was asymptomatic and all of his laboratory tests were normal also. The baby was discharged home with his mother on 26-DEC-2008. At the time of the report, the outcome of the patient was unknown. Upon internal review pre-eclampsia, chorioamnionitis and patient quit dilating and having a C section were considered as other important medical event. Additional information is not expected.

Other Meds: BACTRIM

MedDRA PT Drug exposure during pregnancy, Intra-uterine death, Menstruation delayed

Symptom Text: Information has been received from a physician concerning a female who in approximately June 2009, was vaccinated with first dose of GARDASIL. Second dose was received on approximately August 2009. Subsequently, the patient had delayed menstrual period and was confirmed to be pregnant through ultrasound on approximately October 2009. It was also through the ultrasound that it was found out that the patient had conjoined twins. The patient requested for a second sonogram by a different sonologist on approximately October 2009 and it was during the second laboratory test that it was found that the conjoined twins were already dead. The patient is set to continue with her third dose which is scheduled on 10-NOV-2009. Upon internal medical review, intra-uterine death was considered to be an important medical event. Additional information has been requested.

Other Meds: Unknown

Lab Data: ultrasound, ??Oct?09, pregnant with conjoined twins; ultrasound, ??Oct?09, fetal death

MedDRA PT Arthralgia, Clonus, Dizziness, Gaze palsy, Headache, Malaise, Myalgia, Pyrexia, Syncope

Symptom Text: Case received from a health care professional on 30-OCT-2009 and transmitted by a distributor, under the reference SPV09009. An 18 year old female patient with no relevant medical history had received the first dose of GARDASIL (lot number 0773X, batch number NK19190) via intramuscular route on 09-OCT-2009. One minute after vaccination, she experienced dizziness, a fainting episode, mild clonic movements and eye rolling back. These initial symptoms lasted approximately 10 minutes. Then the patient experienced headache, myalgia, joint pain, fever and malaise. The symptoms lasted 72 hours. The patient was treated with acetaminophen (dose unknown). The patient was not hospitalized nor was she referred for any further testing. In addition, she refused to complete the vaccination schedule with this vaccine. She was not receiving any concomitant medication at the time of the event. At the time of reporting, the patient had fully recovered and was monitored by the reporting physician. She was currently in good health. Dizziness, fainting, clonic movements, eye rolling, headache, myalgia, joint pain, fever and malaise were considered to be other important medical events. No further information expected. Other business partner numbers include E2009-10288.

MedDRA PT Activities of daily living impaired, Antibiotic therapy, Asthenia, Breast swelling, Chest pain, Dizziness, Erythema, Fall, Fatigue, Feeling hot, Gait disturbance, Hypoaesthesia, Loss of consciousness, Pain, Paraesthesia, Syncope, Tenderness

Symptom Text: Initially after the vaccination Jasmyne felt hot and passed out. She was woozy and we waited until she was more stable so we could take her home. Within a week roughly she started to have random fainting spells which she had never experienced before. Additionally, she has numbness/tingling in arms and legs and intermittent chest pains. She is constantly fatigued and because we never know when she will have a fainting episode she is homeschooled. She tends to be very weak and dizzy after she faints and it can take a hour or so for her to regain any strength. Many times her legs give out when she is walking and she falls down. She has seen multiple doctors and specialists. We just monitor her condition and make sure stay hydrated and we also increased her sodium to try and combat the fainting which has been slightly effective. The biggest issue now is the constant fatigue and pain she experiences regularly. 11/16/09 Medical records received fro DOS 1/27/09. PCP notes documents vaccine dates and h/o beast pain, redenss, swelling. ABx therapy.

Other Meds:

MedDRA PT Amnesia, Convulsion, Dizziness, Fall, Fatigue, Headache, Nausea, Syncope

Symptom Text: Initial case was reported on 04-Nov-2009 by a health agency (HA ref. DK-DKMA-20092893). Upon internal review, the case was upgraded to serious as the patient was hospitalized and convulsion was considered a medically significant event. It was reported that a 14 year old female patient was vaccinated with a dose of GARDASIL (i.m. batch number and site of administration not reported) on 16-Jun-2009 at 14:40. Ten minutes post vaccination, the patient experienced dizziness and headache. Twenty minutes post vaccination the patient collapsed (reported as falling by reporter) and experienced 1 minute of convulsions. Since the episode of convulsions, the patient experienced nausea and tiredness. It was reported that dizziness lasted for 70 minutes and that the patient recovered from all other symptoms on 16-Jun-2009. The patient suffered from amnesia of the falling and convulsion episode. It was reported that the patient had not recovered from amnesia. The patient was hospitalized due to the convulsion episode (no dates reported). It was reported that objective examination was normal (not further specified). No blood samples were taken. The patient received no concomitant medicine. Other business partner's numbers included: E2009-10287.

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, LIFE THREATENING, PERMANENT DISABILITY, SERIOUS

MedDRA PT Caesarean section, Drug exposure during pregnancy, Neonatal disorder

Symptom Text: Information has been received from a physician for the pregnancy registry for GARDASIL concerning a 22 year old female who was vaccinated intramuscularly with the first 0.5 dose of GARDASIL in the left upper arm in August 2008 during her first month of pregnancy, reported in (WAES # 0809USA00445) the second dose of GARDASIL in her right upper arm in October 2008 with no other vaccines was given on this date and the third dose of vaccine on her left arm on 04-NOV-2009. Concomitant therapy included 250 mg FLAGYL for bacterial vaginosis infection and folic acid 3 weeks after the visit and the flu vaccine in her right arm. The patient delivered a male child by caesarean section due to gastroschisis 3 months ago. Child had complication gastroschisis, abdominal defect, which required surgery and a longer stay at the hospital after birth. child was being seen by specialist. Follow up information was received from the physician concerning the patient with no obstetric history as well as no medical history or concurrent conditions who was vaccinated with her first, second and third dose of GARDASIL on 05-AUG-2008, 09-OCT-2008 and 04-OCT-2009 respectively. Concomitant therapy included FLAGYL, folic acid from 07-AUG-2008 and influenza virus vaccine on 01-NOV-2008. Amniocentesis indicated that the patient had 4.5 months pregnancy (LMP: 12-AUG-2008; RDD: 19-MAY-2009). On 12-AUG-2009, at 35 weeks of gestation, the patient delivered a abnormal male baby weighting 4 pounds, 18 cm in length with head circumference of 35. The baby was born with gastroschisis. There were no complications or abnormalities for the baby. The mother had not complication during pregnancy and had complication during labor/delivery. The mother did not experienced any infections or illnesses during pregnancy. Amniocentesis indicated that the patient was at 4.5 months gestation. Other medication used during this pregnancy included. Follow up information was received from the physician via telephone on 09-NOV-2009 concerning the patient received the second p

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a licensed practical nurse, for the pregnancy registry of GARDASIL concerning a 17 year old female patient with no pertinent medical history and no drug reactions or allergic reactions, who on 04-DEC-2008 was vaccinated with the first dose of GARDASIL (lot number not provided) 0.5ml intramuscularly. There was not concomitant medication. Nurse reported that the patient was pregnant. Patient sought unspecified medical attention. No adverse effects reported. Follow up information was received from an obstetrician concerning a female patient with no pertinent medical history and no known drug allergies/drug reactions who on 04-DEC-2008 was vaccinated with the first dose of GARDASIL (Lot # not provided). It was reported that there were no complications, infections or illnesses during pregnancy. On 11-JUL-2009 the patient delivered a normal male baby (ID # 40105, weight 6 pounds and 14 ounces, length 19.5"). The patient was 40 weeks from her last menstrual period. There were no congenital anomalies or other complications. abnormalities. Follow-up information has been received via pediatric medical records from a physician concerning the patient's baby with passive smoke risk. It was reported that on 13-JUL-2009, at the age of 3 days, the baby underwent an ultrasound test in order to investigate a scrotal mass. On 13-Jul-2009 the following test results were obtained: blood lymphocyte count 25.0 %, blood segmented neutrophil count 65.0%; blood band neutrophil count 4%, slight anisocyte observation, slight poikilocyte observation, slight polychromatic erythrocyte observation, slight macrocyte observation. On 14-JUL-2009, the ultrasound revealed moderate right sided hydrocele. The baby's testicles appear to be normal with the right testicle measuring 1cm and the left testicle 9mm. Arterial flow was noted in both testicles. On 20-JUL-2009, the patient had a newborn exam which showed that the child was a little underweight at that time. The baby's weight was 5.13 lb and his height was 20 in

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician via a literature article, concerning a pregnant female who on an unknown date was vaccinated with the first dose of GARDASIL. The patient had a spontaneous abortion which occurred 47 days after vaccination with the first dose of GARDASIL. This report was part of a post-marketing surveillance program. The primary investigator felt that spontaneous abortion was possible related to the study therapy. Upon internal review spontaneous abortion was considered to be an other important medical event. This is one of several reports from the same source. No further information is available. A copy of the published article is attached as further documentation of the patient's experience.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Convulsion, Immediate post-injection reaction, Pallor, Syncope, Unresponsive to stimuli

Symptom Text: It was reported that a 12-year-old girl was vaccinated with GARDASIL (parenteral route, first dose) on 24-SEP-2009. Health Authority coded convulsion, syncope, pallor of skin and pallor facial (causalities possible) with onset immediate after vaccination. It was reported that the girl was not able to contact during the syncope which lasted for about 40 seconds. When she woke up, she was pale in the face for 15 minutes. The girl had previously had a similar attack (not further specified) once in school. The nurse advised her mother to get in contact with a doctor for further investigations. She also clearly said that there no signs of anaphylaxis. Form this description, the Health Authority reported that the reaction could possible be a vasovagal reaction. Since the patient had experienced a similar reaction before, the Health Authority also suggested further investigation to exclude possibly underlying neurological disease. The result of this investigation should be known before dose 2 of GARDASIL was given. The outcome was recovered. The events were reported to be other important medical event. Other business partner numbers include E2009-10364. No further information is available. Case is closed.

MedDRA PT Cough, Haematuria, Henoch-Schonlein purpura nephritis, Influenza, Kidney infection, Myalgia, Oedema peripheral, Pain in extremity, Pyrexia, Rash generalised, Rash macular, Staphylococcal infection, Streptococcal infection

Symptom Text: Information has been received from a health professional concerning an 11 year old female student with high blood pressure, an allergy to amoxicillin (hives) and no illness at the time of vaccination who on 20-AUG-2007, was vaccinated intramuscularly with the first dose of GARDASIL (lot# 658556/1060U) into the left thigh. On 06-NOV-2007, the patient was vaccinated intramuscularly with the second dose of GARDASIL (lot# 65435/1265U) into the left thigh and with a first dose of MENACTRA (lot# U2429AA), IM into the right thigh. Concomitant therapy included VASOTEC for blood pressure. On 15-NOV-2007 it was reported that the patient developed rash over her body which started on 08-NOV-2007 (2 days after the second dose of GARDASIL and MENACTRA). A rapid Strep test was performed in the office and was negative. On 16-NOV-2009, she then had a slight growth of Staph A. She was seen again and her feet were hurting, and her left foot had slight edema. Her urine had trace protein, but no blood. She was started on KEFLEX capsules, 500 mg BID for 10 days. She was diagnosed with Streph A and Henoch Schonlein Purpura (HSP) nephritis. It was reported on 27-NOV-2007, a rash developed all over her left foot, edema, and left calf muscle. On 02-JAN-2008, the rash reoccurred. The patient was seen on 04-NOV-2008. Her urine was okay, but both her feet had red maculas, but no blisters. She was to see a dermatologist on 09-JAN-2008. Her rash cleared and no kidney tests were done. On 12-AUG-2008, she had a well exam and laboratory tests were performed. Her urine had 4+ blood, 3+ protein and "urine hemoglobin ++. Her urine protein was over 50, throat culture negative, and urine culture negative. On 14-AUG-2008, she saw a dermatologist. Her BUN was 9, creatinine was 0.5 and blood pressure was 102/52. Relevant laboratory diagnostics performed indicated HSP nephritis most likely post Strep, however, she also had the immunizations. On an unspecified date, she was seen by a kidney specialist. The patient recovered on an unspecified date. Upon int

MedDRA PT Menorrhagia, Syncope, Vaginal haemorrhage

Symptom Text: Information has been received from a consumer concerning her 13 year old daughter who was vaccinated at a clinic with a dose of GARDASIL during a physical for her school on 25-AUG-2009. It caused a side effect, the patient fainted at school, and had to be rushed to the hospital. She was heavily bleeding from the vagina. The daughter was not bleeding until she took the shot. The patient went back to physician and the physician said she did not know talking (crazy) referred her to another doctor. The reporter noted that other female girls did not want the shot if it messed up her daughter's body. The daughter was afraid of getting more shots because of the damages that had been done to her with this shot. She is still bleeding. The mother was trying to talk to her about going to the doctor. Additional information has been requested. 12/15/09 Medical records, VAX records received for DOS 08/11/09. Well child physical; menarche 7/08. 12/22/09 Medical records received for DOS 10/06/09. Pt. presents with vaginal bleeding since 08/24/09: dark red blood, no clots. Referred to GYN specialist. Impression: menorrhagia

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Alopecia, Asthenia, Asthma, Asthma exercise induced, Blood pressure decreased, Chest discomfort, Condition aggravated, Confusional state, Convulsion, Dizziness, Dry eye, Ear congestion, Ear discomfort, Excoriation, Eye pruritus, Eye swelling, Fatigue, Feeling cold, Head injury, Headache, Hyporeflexia, Immune system disorder, Infectious mononucleosis, Lacrimation increased, Listless, Loss of consciousness, Malaise, Pallor, Productive cough, Sinusitis, Skin laceration, Syncope, Tongue biting, Wheezing

Symptom Text: Patient woke up feeling faint and cold. She was light headed and complained at school to several people that she felt faint. Then she did faint and she had a seizure that lasted 2 minutes. She was taken to the hospital by the paramedics. MRI, EEG all tests were normal. No explanation for this event. Next shot is June 2008. Patient appears immune-compromised. She is constantly sick and complains of fatigue. She returns to college. She is sick from Sept thru Dec. No amount of antibiotics helps. Her hair is falling out. She is pale, listless, without energy. On Dec 27, 2008, she passes out again, first thing in the morning after feeling cold and faint. Again she suffers a seizure and is unconscious for 2 minutes. She is taken to the hospital and no explanation can be found for this drop in blood pressure, syncope and seizure. Eleven months later she has another episode exactly like the first two. Throughout the year she has suffered from unexplained drops in blood pressure. She has never regained her energy level and is often sick with sinus infection like symptoms, but her sinuses are clear (x-ray) and no amount of antibiotics help. When she received the second Gardasil shot she also received the Menactra vaccine. 12/29/09 Pediatric Medical records received for DOS 01/02/08-01/05/10. PCP notified by school that pt. had first seizure activity on 01/18/08 and was transported by ambulance to hospital. DC home to f/u with neurologist, MRI and EEG. Reported instances of seizure activity on 12/30/08, 01/01/09 and 11/25/09. Referrals to allergist, cardiologist and neurologist. ```1/29/10 allergy notes rec'd from 4/2008-6/2009 with dx: Increased BA (bronchial asthma). Increased EIA (exercise induced asthma). Pt initially presented in 4/2008 with c/o increased asthma sx. C/o dry eyes, productive cough, wheezing and chest tightness with exercise. Reports Mono in 1/2008. RTO 5/29/09 with persistant cough, H/A QOD, itchy watery eyes, ear fullness and congestion since 11/08.-additional dx: sinusitis.

Other Meds:

Lab Data: No diagnosis to date. All tests are inconclusive for any problems. Clear EEGs. No heart problem. Never used any drugs. Always healthy until this. 12/29/09 Diagnostics: Normal MRI and EEG ```LABS and DIAGNOSTICS: CT Head - Abnormal.

History: none 12/29/09 PMH: Asthma; Allergic to Bactrim. ```PMH: Dry skin. Abnormal menstrual bleeding.

MedDRA PT Abasia, Gait disturbance, Hemiplegia, Hyporeflexia

Symptom Text: Information has been received from a physician concerning a 17 year old female patient who on 04-Nov-2009 was vaccinated IM with the first dose of GARDASIL (manufacturer, batch number and site unknown). It was reported, that the female patient was vaccinated with a second vaccine on the same day (manufacturer and type of vaccine unknown). It was reported that the patient developed 15 minutes after vaccination a hemiplegia (left side) in arm, leg and face. The patient was unable to walk. It was reported that the patient went to the physician 5 days post vaccination. The physician strongly recommended the patient to visit the neurologic ambulance. It was reported, that at this time, the palsy was recovering and the patient was able to walk again. The physician diagnosed marginal reduced reflexes, slight insecurity in walking, but no strength difference left to right side. The female patient has partly recovered. The patient's Hemiplegia (left) was considered to be an other important medical event by the reporter. Other business partner numbers include E2009-10462.

MedDRA PT Condition aggravated, Throat tightness, Trismus

Symptom Text: Information has been received from a 23 year old female with penicillin, ibuprofen, and Amoxicillin allergy and a history of temporomandibular joint disorder who was vaccinated with GARDASIL in 2007 and in July 2007 after the third dose she went to the emergency room because her jaw locked. The therapy started at "the beginning of 2007". There was no concomitant medication. The consumer reported that she did not stay over night but they gave her anesthesia at the hospital and knocked her jaw back in place. The consumer reported that about four months ago she had her latex gloves on, since she works at a dentist office, and later that night her throat closed up and she went to the emergency room and was there for 6 hours and was given corticosteroids (manufacturer unspecified) and BENADRYL (manufacturer unspecified) and then she was fine. The consumer reported that another time her throat closed up again and at the hospital they gave her an epinephrine (manufacturer unspecified) pen and then she was fine. There were no labs and diagnostic tests performed. This is one of several reports received from the same source. Upon internal review the event of throat tightness treated with an EPI pen was considered to be an other important medical event. No further information is available.

MedDRA PT Anaphylactic reaction, Food allergy, Inappropriate schedule of drug administration, Rash

Symptom Text: Information has been received from a pharmacist concerning her 21 year old daughter with polycystic ovarian syndrome and no known allergies who in March 2009, was vaccinated with the third dose of GARDASIL (lot number not reported). Concomitant therapy included DESOGEN. It was reported that the patient has started having severe food allergy reactions to foods that in the past she could eat with no problem after the vaccination in March of 2009. These food reactions started as rash reactions, but have become anaphylactic reactions in recent episodes. The pharmacist stated that her daughter has been in the emergency room three times in the past month. EPIPEN and oxygen were used. The patient was not admitted. At the time of the report, the patient had not recovered. The rash and anaphylactic reactions were considered to be disabling, life threatening and other medical events by the reporter. Follow-up information has been received from a registered nurse at whose office the patient received her doses of GARDASIL. On 10-SEP-2007 the patient was vaccinated with the first dose of GARDASIL (lot number unspecified) on 16-NOV-2007 the patient was vaccinated with the Second dose of GARDASIL (lot number 655154/1210U), on 08-MAY-2009 (previously reported as in March 2009) the patient was vaccinated with the third dose of GARDASIL (lot number 661953/1130X). The patient did not receive any concomitant vaccinations when GARDASIL doses was administered. The patient was taking birth control pills LOESTRIN 24. The R.N. stated that the patient had not seen in the office since 08-MAY-2009. Additional information has been requested.

MedDRA PT Transaminases increased

Symptom Text: Information has been received from a general practitioner concerning an 18 year old female patient who had received the first dose of GARDASIL (Batch number not reported) in July 2009. 15 days after vaccination, the patient was found to have a very significant increase of transaminases, i.e. 363 for a normal range at around 54. There was no suspected viral hepatitis as all serologies were negative. The patient's transaminases rate progressively returned to normal. Everything was normal at the end of September. Upon internal review the events were considered medically significant. Other business partner numbers included: E2009-10404. Additional information has been requested.

MedDRA PT Pancreatitis

Symptom Text: Information has been received from a physician concerning a 15 year old female patient with obesity and no drug reaction or allergies who in 2009 (approximately September), was vaccinated intramuscularly with the second 0.5 ml dose of GARDASIL. There was no concomitant medication. Six-eight weeks ago (approximately October 2009), the patient developed idiopathic pancreatitis one month after her second vaccination. The patient sought unspecified medical attention. The physician suggested that the patient continue with the series, but the consumer's parent decided to discontinue it. The patient had been hospitalized three times for this adverse event. At the time of the report, the patient was recovering. Additional information has been requested.

MedDRA PT Abortion, Drug exposure during pregnancy, No adverse event

Symptom Text: Information has been received from a physician for GARDASIL, a Pregnancy Registry product, concerning a 10 year old female with no medical history or drug allergies who on 03-FEB-2009 was vaccinated intramuscularly with her first 0.5 ml dose of GARDASIL (lot# 661530/0575X) and then discovered that she was pregnant. No adverse effects were reported. The patient sought medical attention by visiting the physician's office. There was no concomitant medication. On 16-MAR-2009 pregnancy test showed positive (LMP: 17-FEB-2009, EDD =24-NOV-2009). Follow-up information has been received from a nurse practitioner. It was reported the patient had not returned to the office for follow up. The patient had an abortion performed on 17-APR-2009. When the office contacted the patient to arrange for the second dose of GARDASIL, the patient told the nurse practitioner, "I will not be getting anymore of those shots. I have been through enough with the abortion". Follow-up information has been received from the nurse practitioner. It was reported that the patient was 20-year-old not 10-year-old as previously reported. The patient had recovered from the abortion on an unspecified date. The patient had the abortion for a number of reasons including that "she was not married and was exposed to the GARDASIL. Upon internal review, "abortion" was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Embolism venous, Visual impairment

Symptom Text: Information has been received from a physician concerning a >40 year old female, who in August 2009, was vaccinated IM with 0.5 ml first dose of GARDASIL (dose and lot number not reported). This report was part of a study. Two months after the vaccination (approximately in October 2009), the patient had a visual problem that after consulting with her ophthalmologist, the patient was diagnosed with eye thromboemboli. The patient went to the physician for medical care and the visual problem was only recovered by 10%. In October 2009, the patient went again to the physician for medical care but seeing a different doctor and the patient was diagnosed with venous thromboemboli. At the time of the report the outcome of the patient was not recovered. At this time, relationship of eye thromboemboli vena to study therapy is unknown. The physician felt that the Thrombo emboli vena was considered to be disabling. Additional information has been expected.

MedDRA PT Apgar score normal, Caesarean section, Drug exposure during pregnancy, Foetal disorder, Streptococcal identification test positive

Symptom Text: Initial case report received from a physician and registered nurse via Vaccine Adverse Event Reporting System (VAERS) on 06 NOV 2009. A 17-year-old female patient was vaccinated with FLUVIRIN (batch no. unknown) and GARDASIL (first vaccination) on 1 MAR 2008. The patient became pregnant, last menstrual period (LMP) was on 10 SEP 2008. The delivery date was estimated for 08 JUN 2009 by early ultrasound. A caesarean section due to non-reassuring fetal heart rate was performed on 01 JUN 2009. The patient was tested positive for group B streptococcus and was treated with intravenous antibiotics during labor. The baby's apgar scores were 7 at one minute, 8 at five minutes and 9 at ten minutes. The patient had recovered at the time of the report.

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, LIFE THREATENING, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abasia, Asthenia, Back pain, Blood product transfusion, Demyelination, Dysphagia, Dyspnoea, Dysstasia, Eating disorder, Endotracheal intubation, Feeling abnormal, Gastrointestinal tube insertion, Guillain-Barre syndrome, Heart rate increased, Hypoaesthesia, Intensive care, Mobility decreased, Muscular weakness, Pain, Pain in extremity, Paraesthesia, Paralysis flaccid, Plasmapheresis, Pneumonia, Posture abnormal, Pyrexia, Respiratory failure

Symptom Text: Information has been received from a physician's assistant who received an e-mail from a family friend, concerning a 12 year old female patient who a "couple of weeks before" in approximately June 2009, was vaccinated with a dose of GARDASIL vaccine. On approximately 30-JUN-2009, the patient was diagnosed with Guillain Barre syndrome. The patient was admitted to the hospital the night of 30-JUN-2009. As of 01-JUL-2009, the Guillain Barre syndrome continued to move throughout the patient's body, affecting her lungs. The patient's parents consented to induce her into a coma. Per the patient's father, his daughter has been moved to a more restrictive area of the Pediatric Intensive Care Unit and was intubated in the morning of 02-JUL-2009. It was reported that with the "machine assisting the patient in breathing", she is getting more oxygen and resting more comfortably which is a "good thing", since before of the intubation she was expending all of her energy just trying to breath, and she could not get in a comfortable position with the constant pain. In the patient's current semi comatose state, she has opened her eyes and has moved her limbs a little bit. It was reported that the patient has run a fever so she has been started with antibiotics. The patient's father stated that the longer his daughter is assisted in breathing, the greater the chances are that she will need a tracheotomy and she might be hospitalized for an additional month. The reporting physician's assistant's friend stated that there is a good chance that the patient's Guillain Barre syndrome was an adverse reaction to the immunization with GARDASIL vaccine. At the time of reporting the patient had not recovered. The health care professional contacted during telephone follow-up could not supply the following information: date of birth, exact date (s) of vaccination, dose number, lot number, healthcare provider name and contact information. Guillain Barre syndrome and fever considered to be disabling, life threatening and required intervention to

MedDRA PT Condition aggravated, Convulsion, Gaze palsy, Loss of consciousness, Malaise, Presyncope

Symptom Text: Information has been received from a general practitioner concerning a 14.5 year old female with a history of vagal malaises and described as a neurotonic patient, who on 05-NOV-2009 was vaccinated with the first dose of GARDASIL (route and LOT# not reported). Three minutes after vaccination, the patient experienced a loss of consciousness associated with convulsive and ocular revulsion. Vagal malaise (or impressive malaises) or convulsive seizure were two evoked diagnoses. Constants were correct. The loss of consciousness lasted for 10 seconds. There was no sequelae, no pain at the moment of the injection. The patient consulted to the Emergency Unit Care where the diagnosis of vagal malaise was established without exam. A neurological consultation was planned to assess whether it was a convulsion or not. To be noted that when the patient described the events to her mother, the latter experienced a vagal malaise. At the time of reporting, the patient had recovered. The AEs were considered to be serious as other medical important events. Other business partner numbers included: E2009-10520. No further information is available.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a general practitioner, for the Pregnancy Registry for GARDASIL, concerning a 15 year old female patient with no relevant medical history and no treatment who received the first dose of GARDASIL (Batch No. not reported) on an unspecified date while she was 3 month pregnant. She consulted with the reporter to receive the second dose of GARDASIL as she was in her 5th month of pregnancy but she still did not know that she was pregnant. She went abroad to have an induced abortion practiced as she was beyond her 5th month of pregnancy. There was no medical cause which justified the induced abortion. No reaction was reported after the first dose of GARDASIL. It was noted that the case was not enrolled in the GARDASIL registry (patient's initials and date of birth are unknown). Induced abortion was considered to be an other important medical event. Other business partner numbers include: E2009-10515. No further information is available.

MedDRA PT Condition aggravated, Epilepsy

Symptom Text: Information has been received from a healthcare professional concerning a 15 year old female patient who received the first dose of GARDASIL (batch number LH42160) on 10-NOV-2009 in the evening and 10 hours later, in the morning of 11-NOV-2009, she experienced a seizure of rolandic epilepsy. The reaction was described as moderate. The patient recovered within an unspecified period of time. The patient had experienced three seizures of rolandic epilepsy three years before. She had not experienced other isolated seizures until then. She was taking no treatment: No adverse reaction had occurred following childhood vaccinations. It is noteworthy that she had come back from holiday with a jet lag and therefore she was tired, and she had worked late on computer. These risk factors were reported to be the usual triggering factors for that kind of seizures. Seizure of rolandic epilepsy was considered to be an other important medical event. Other business partner numbers include E2009-10519.

MedDRA PT Arthralgia, Arthritis, Eosinophil count, Eosinophilia, Fatigue, Haematuria, Hypoaesthesia, Joint stiffness, Joint swelling, Leukocytosis, Myalgia, Neutropenia, Oropharyngeal pain, Paraesthesia, Pyrexia, Red blood cell sedimentation rate decreased, Red blood cell sedimentation rate increased, Testicular swelling, Thrombocytosis

Symptom Text: sore throat, high fever followed by total body joint pain and swelling. treatment began with a prednisone shot 11/25/09 ED Notes for DOS 01/17/09. Final DX: Inflammatory arthritis, systemic symptoms of fever and fatigue, sore throat self-limiting, leukocytosis infcluding eosonophilia/neutrophilia, and microscopic hematuria. Pt presented to ED with 2 wk hx of joint pain, swelling and stiffness. The pain started in her hands and generalized to her jaw. Pt did not have fever, but had sore throat for 3 days, which went untreated. Pt noted that she was unable to form a fist. On 01/14/09, Pt was seen in urgent care and tests confirmed leukocytosis, elevated ESR, and hematuria. NSAIDs, Vicodin and prednisone did not resolve the arthralgias. Upon physical assessment, Pt was found to have a recent numbness, tingling of hands that resolved. Pt's physician suspected a diagnosis of possible adult onset of Still disease based on her symptoms, although the Pt did not meet all the criteria. Prednisone 20 mg/day was started. Pt scheduled for a follow up visit in 1 month. 11/25/09 Follow up visit notes for DOS 04/29/09. DX: Inflammatory arthritis, leukocytosis, thrombocytosis, recent microscopic hematuria. Pt complained of ongoing difficulties with wide spread joint pain and fatigue. Pt did not have visible swollen joints and prednisone was thought to have resolved this event. Physician reduced prednisone dose to 15 mg/day. Follow up visit was scheduled for 2 months. 11/25/09 Follow up visit notes for DOS 06/26/09. DX: Inflammatory arthritis and microscopic hematuria, indeterminant significance. Pt complained of uncontrolled pain and swollen joints of hands with morning stiffness that improves as the time goes on. Follow up visit scheduled for 2 months. 11/25/09 Follow up visit notes for DOS 07/02/09 DX: Hematuria. Pt felt better with no pain or swelling and wanted to be off prednisone. Follow up visit scheduled for 2 months. 11/25/09 Follow up visit notes for DOS 09/04/09 DX: Inflammatory polyarthritis

MedDRA PT Abdominal pain, Cell death, Henoch-Schonlein purpura, Leukocytoclastic vasculitis, Necrosis, Petechiae, Purpura, Skin lesion

Symptom Text: Case received from the health authorities (reference number 2009-03529) on 10-NOV-2009, and transmitted by SPMSD. A 13 year old female patient had received the first dose of GARDASIL (Batch # NM55660) via intramuscular route on 06-FEB-2009, and the second dose of GARDASIL (Batch # NS35180) via intramuscular route on 07-APR-2009, date on which she also received a dose of RECOMBIVAX HB (Batch # not reported) via intramuscular route. On 19-APR-2009, she developed patechiae and purpura on both lower limbs. The events resolved spontaneously. On 24-APR-2009 and 25-APR-2009, the patient experienced mild abdominal pain without nausea, vomiting or diarrhea. She "denied sore throat". On 27-APR-2009, there was a major recurrence on lower limbs, asymptomatic. The patient was admitted to the hospital from 30-APR-2009 to 03-MAY-2009 on dermatology ward. The patient's general health was reported as good, blood pressure was normal, heart rate was normal, there was no fever, heart beating was normal too. Cardio respiratory auscultation was normal. The abdomen did not show any abnormalities. There was no lymph node enlargement, and no abnormalities on the oral cavity. On a dermatological level, pupuric lesions were palpable on the lower limbs below the knee. The diagnosis was leukocytoclastic vasculitis in henoch-scholein purpura, probably postvaccinal. The diagnosis was confirmed by histological examination on 30-APR-2009. There were a few areas of basal keratinocytic necrosis, in the superficial and middle dermis, substantial extravasation of erythrocytes and some perivascular and partly interstitial neurophilic infiltrate, with karyorrhexis. Signs of fibrinoid necrosis were present on the wall of a few small blood vessels. There was no thrombosis, but some eosinophils in the infiltrate, which confirmed leokocytoclastic vasculitis. Antinuclear, anti-DNA and anti-neutrophil cytoplasmic antibodies (ANCA) tests were negative. Direct inmmunofluorescence was negative. Throat swab and antistreptolysin antibody test were both normal. A

MedDRA PT Dermatitis atopic, Diarrhoea, Nausea, No reaction on previous exposure to drug

Symptom Text: Case received from a health care professional on 14-NOV-2009. This case is poorly documented. It was forwarded too late by a pharmacist. It was reported by a gynecologist that a 16 year old female patient with history of neurodermatitis who was vaccinated with the first and the second dose of GARDASIL on 14-JUL-2007 and 25-SEP-2007 and were all well tolerated. On 29-JAN-2008 the patient was vaccinated with a third dose of GARDASIL (batch # NG20180, lot # 0510U, injection route not reported) into the left upper arm. Unspecified time p.v. the patient developed diarrhoea, persistent nausea and as written atopic dermatitis (not otherwise specified). At the time of completing the reporting form (Date 26-APR-2008) she was hospitalized and had not recovered. Other business partner numbers include: E2009-10554. No further information available.

MedDRA PT Arthralgia, Asthenia, Diplegia, Dizziness, Fatigue, Monoplegia, Muscle spasms, Myalgia, Pain in extremity, Vaccine positive rechallenge

Symptom Text: Information has been received from a published article, concerning a female patient (age not stated) who on an unspecified date was vaccinated with the first dose of GARDASIL. One week later developed dizziness, muscle pain, joint pain, weakness and cramps. Before administration of the second dose, she had experienced both recovery and recurrence of her symptoms. A neurological examination showed marked fatigue and near paralysis of her legs and arms. Her symptoms recurred 2 to 3 weeks after her third dose of vaccine. She recovered within a few days but, approximately 6 weeks after her third dose, she experienced a fourth attack marked with only dizziness and pain in hands during physical activity. At the time of reporting the patient's outcome was no stated. Upon internal review paralysis was considered to be an other important medical event. This is one of several reports received from the same source. Additional information has been requested. A copy of the published article is attached as further documentation of the patient's experience.

MedDRA PT Arthralgia, Clonus, Condition aggravated, Fatigue, Fibromyalgia, Headache, Loss of proprioception, Musculoskeletal pain, Pain in extremity, Pharyngitis streptococcal, Photophobia, Sleep disorder, Tremor, Vaccine positive rechallenge, Weight decreased

Symptom Text: First administration of Gardasil in 07/08 with bilateral hand tremor beginning 08/08. Second administration on 12/31/08 with hand pain beginning 02/09 and extending to wrists, elbows, shoulders, back, hips, knees, ankles, feet and toes by 04/09. Final administration is 07/09 with immediate increase in pain. The physician was asked about possible reaction after the first dose. The physician advised there was no connection. Patient has been dx with fibromyalgia; however, no successful tx at this time. Along with the tremor, other neurological involvement is indicated by bilateral clonus and proprioceptive symptoms in her legs. Patient also suffers headache and significant fatigue. Patient has been unable to sleep in bed for several months and does not get solid, consecutive hours of sleep. She has lost 20 pounds since this past Spring. There are days patient requires moderate assistance for sit-to-stand. 12/04/09 Consult note for DOS 01/30/09. DX: Essential tremor Pt c/o hand tremor that is bothering when writing for 4-5 mos. On neurological exam: weight, head and height were all above 90th percentile; mild postural tremor BUE. Physician considered this diagnosis of essential tremor as benign and suggested reducing caffeine and stress. Pt to follow up prn. 12/08/09 Follow up consult for DOS 11/09/09. DX: Fibromyalgia Pt c/o L knee pain, neck pain, inguinal pain, finger joint pain, hand pain, wrist joint pain, elbow joint pain, shoulder joint pain, back pain in Lumbar spine, buttock pain, and hip. Musculoskeletal exam: confirmed joint pain in L fingers, shoulder, L and R knees, L and R ankles; tx: Soma. Pt c/o pain continuing.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Arthralgia, Cough, Dizziness, Fibromyalgia, Insomnia, Oropharyngeal pain, Pain, Sinus disorder, Tremor

Symptom Text: Information has been received from a physician concerning a female with rhinitis allergic and allergic reaction to antibiotics who on 29-SEP-2008 was vaccinated with the first dose of GARDASIL (lot# not reported) and on unspecified dates vaccinated with the second and third dose of GARDASIL (lot# not reported). Concomitant therapy included ALLEGRA and NASONEX. It was unspecified if any other vaccines were administered. After the first dose of GARDASIL, unknown how long post vaccination, the patient experienced pain at multiple sites, dizziness, and insomnia. Unspecified medical attention was sought. The patient was diagnosed by rheumatologist with fibromyalgia. It was also reported that the patient will also have follow up consult with a neurologist. Follow up information has been received from a registered nurse and a licensed practical nurse concerning the 13 year old female patient. The registered nurse reported that the female patient was with a concurrent condition of allergic rhinitis. The patient on 29-SEP-2008, 31-DEC-2008 and 23-JUL-2009 was vaccinated with her first, second and third dose of GARDASIL respectively. The patient was first seen in their office on 02-DEC-2009. The patient was scheduled to see a pediatric neurologist. The licensed practical nurse provided additional information. She confirmed that the patient was on concomitant medications ALLEGRA and NASONEX for the concurrent condition of allergic rhinitis. The patient's antibiotic allergies were to amoxicillin, AUGMENTIN and ZITHROMAX. The patient was vaccinated on 29-SEP-2008, 31-DEC-2008 and 23-JUL-2009 with her first, second and third dose of GARDASIL (lot numbers were 660618/0572X, 660618/0572X and 661952/1129X) respectively. The nurse reported the patient was seen on 02-DEC-2008 with "hand shaking" that started five weeks prior. At the January 2009 office visit, the problem persisted. Other office visits were on 13-APR-2009 for a sinus problem, 02-SEP-2009 for a sore throat, and 18-SEP-2009 for a cough. The patient was last seen in th

Symptom Text: Information has been received from a physician concerning a female "sophomore in high school" student patient who on an unspecified date was vaccinated with the first 0.5 mL GARDASIL and on unknown date received the second dose of GARDASIL. It was reported that the patient developed rash after getting two doses of GARDASIL. The patient sought unspecified medical attention. At the time of reporting the patient had not recovered. Follow up information has been received from a physician via medical records, concerning a 16 year old female student with allergy to DILAUDID, and a medical history of adenoidectomy, endotracheal intubation insertion, tonsillectomy, PE tubes and an orthopedic surgery (internal fixation of left arm fracture), who on 03-NOV-2008, was vaccinated with the first dose of GARDASIL (Lot No: 657737/0522U), in the left arm. On 20-JAN-2009. the patient was vaccinated with the second dose of GARDASIL (Lot No: 659437/1266U), in the left arm. Concomitant medications included doxycycline, TYLENOL and ZYRTEC. In February 2009, the patient experienced costochondritis. On 02-APR-2009, the patient presented for evaluation of one month of sickness with hives and then migrating joint pain. The patient presented with complaints of pain to all the joints and muscle pain. On of a scale of 10 the pain was 7. The severity of her fatigue on a scale of 10 was 7. The patient experienced morning stiffness duration 10 minutes. The physician reported that the patient stated that this condition started suddenly. The symptoms had been intermittently present for the last one month, with waves of hives and overall aching and now with recurrent erythema but without itching. The patient noted fevers as coming off the MEDROL and had sweats when on the steroids. The physical exam did not show any abnormality, except for the musculoskeletal exam that showed joints affected primarily in the ankle, and possible inflammation of the MTP. The skin exam showed scattered macules of the arms and more confluent itchy area of the skin on

MedDRA PT Confusional state, Cyanosis, Headache, Hemiplegia, Hypersomnia, Loss of consciousness, No reaction on previous exposure to drug, Pallor, Presyncope, Syncope

Symptom Text: Initial case was reported on 17-Nov-2009 by health Authority (HA ref. DK-DKMA-20093679). It was reported that a 12 year old female patient was vaccinated with the second dose of GARDASIL (yeast) (intramuscularly, batch and site of administration not reported) at 14:00 on 03-Nov-2009. Fifteen minutes later, the patient suddenly experienced lipothymia and collapsed. It was reported that the patient was pale and cyanotic around lips, and lost consciousness for a couple of minutes. Subsequently, the patient was confused for a couple of hours and experienced paralysis of left side and left side headache. It was reported that the patient slept deeply for hours and was admitted to hospital in the afternoon on 03-Nov-2009. Examination revealed paralysis of left lower extremities. It was reported that the patient received treatment with mild antihistamines (no further specified). The next day the patient was recovering. Duration of the hospitalization was not reported. The patient had a medical history of feeling unwell in connection with taking blood samples. The patient had no medical history of feeling unwell in connection with vaccination. The patient was vaccinated with the first dose of GARDASIL (yeast) (intramuscularly, batch number and site of administration not reported) on an unreported date. No adverse reaction was reported.

MedDRA PT Cat scratch disease, Lymphadenopathy

Symptom Text: Information has been received from a health authority (HA ref. DK-DKMA-20090510) concerning a 13 year old female who on 01-OCT-2008 was vaccinated IM with the first dose of GARDASIL. On 01-NOV-2008 the patient developed swollen glands on right groin. The patient was admitted to hospital (date and duration not reported). At the time of the report, the patient was not recovered. Follow-up information received on 12-NOV-2009 from Health Authority. Blood samples taken on 18-MAR-2009 revealed Bartonella Henslae infection. It was reported that swollen glands on right groin was due to Bartonella Henslae infection and not related to the vaccination. Outcome was not reported. Case is closed. No further information is available. Other business partner numbers include E2009-02176.

MedDRA PT Abasia, Arthralgia, Balance disorder, Delirium, Dizziness, Dysarthria, Eye rolling, Immediate post-injection reaction, Injection site haemorrhage, Pain in extremity

Symptom Text: On Thursday Oct. 1st, I answered the clinic phone for a "question about vaccinations" per front desk. The phone call was from mother. She reported that she brought her 16 year old daughter to hospital for "immunizations." Mother reported that daughter was given Hepatitis A, HPV, and Meningitis vaccine at about 5pm on Tuesday 09/29/09. Mother commented " they talked to me into getting the meningitis one." She said that daughter got "dizzy" right away and had commented that she felt the meningitis shot "in elbow." Mom reported that daughter said her knees hurt on the way home and was rubbing her knees and legs in the car. Mother took daughter to the ER at around 9pm. She said that daughter was "delirious", she "couldn't walk or talk" and her "eyes were rolling back in her head." Mom denies fever, respiratory distress or seizure activity in her daughter at that time. Pt was admitted to hospital on 09/29/09 and kept for 24 hours while "tests" were run. Mother stated that doctor was called in "consult" and that her daughter's MRI showed "fluid in the brain". Her symtomology resolved spontaneously according to her mother, "going backwards" with the last symptoms resolving first and finally the pain in legs, knees, and her arm resolving. Mother said that doctor told her this could only happen if the meningitis vaccine had been give "direct IV". At this time mother is mainly concerned because daughter's arm bled and she didn't know if that meant the shot went into her vein or not. I reassured mother that bleeding from the injection site after an immunization is not uncommon and does not mean that the vaccine accessed the vein. She seemed to be calmer after that, talking a little slower and with less emphasis. I told her I would check with my superior and call her back. Discussed the reaction with PNP. She suggested I file VAERS report and encourage mother to do the same. Called mother at home and asked if she still had the VIS sheets given at time of daughter's vaccinations. She did, I asked her to look at the back of th

MedDRA PT Delivery, Drug exposure during pregnancy, Pneumonia

Symptom Text: Information has been received from a nurse, for the pregnancy Registry for GARDASIL, concerning a 21 year old female with a history of a "rash from PERCOCET" who was vaccinated with first (lot # 659182/1757U), second (lot # 660389/1968U) and third (lot # 660557/0072X) doses of GARDASIL on 24-MAR-2008, 28-MAR-2008 and 17-SEP-2008 respectively. There was no concomitant medication. Subsequently the patient was vaccinated with 3 doses of GARDASIL and was pregnant. The patient's last menstrual period was in question but may have been on 06-SEP-2008. The patient was not experiencing any problems. A urine pregnancy test was performed on 13-OCT-2008 and the result was positive. The patient sought medical attention. Follow up information has been received from a certified nurse midwife and a licensed practical nurse concerning a 21 year old female with a history of a "rash from PERCOCET", asthma, appendectomy and no previous pregnancy who was vaccinated with first (lot# 659182/01757U), second (lot# 660389/1968U) and third (lot# 660557/0072X, IM in deltoid) doses of GARDASIL on 24-MAR-2008, 28-MAY-2008 and 17-SEP-2008 respectively. Concomitant therapy included prenatal vitamins (unspecified), daily. The patient did ultrasound on 20-Oct-2008 for dating and the result was 6.5 weeks intrauterine pregnancy. The patient did maternal serum alpha fetoprotein on 19-Dec-2008 and the results was within normal limits. The patient did first trimester screening on 01-Dec-2008 and the result was within normal limits. The patient did ultrasonography on 15-JAN-2009 and the result was 20 weeks intrauterine pregnancy. Follow up information has been received from a certified nurse midwife concerning a 21 year old female tobacco user who was pregnant. Subsequently, in approximately October 2008 the patient developed pneumonia and was treated with AVELOX, 400 mg daily, from 10-OCT-2008 to 17-OCT-2008. On 17-JUN-2009, the patient delivered a normal 5 pound 15 ounce male infant. There were no congenital anomalies or any complications during pre

MedDRA PT Drug exposure during pregnancy, Hydronephrosis

Symptom Text: Information has been received from the pregnancy registry for GARDASIL from a 23 year old female patient, with no pertinent medical history and no drug reactions/allergies, who on 26-JUN-2008, was vaccinated with the first dose of GARDASIL. Concomitant therapy included cephalexin. A few days later after receiving the first dose of GARDASIL, the patient found out she was pregnant. The patient sought medical attention. The last menstrual period was six weeks from 23-JUL-2008 (approximately on 11-JUN-2008). On an unspecified date, was performed a pregnancy test resulting positive. Estimated date of delivery approximately 18-MAR-2009. No adverse reaction was reported. Follow up information received from the patient indicated that on 12-MAR-2009 she gave birth to baby girl. It was reported that the baby had "some problems"; the baby was born with hydronephrosis in her kidneys and had two surgeries. The baby was "doing fine now". Additional information has been requested.

MedDRA PT Fatigue, Laboratory test, Pancreatectomy, Systemic lupus erythematosus

Symptom Text: Information has been received concerning a female patient "maybe college-age" with unspecified medical history, drug reactions or allergies, who in 2008 was vaccinated with a dose of GARDASIL (route and lot # unknown). Concomitant medication unspecified. On 17-NOV-2009, a news station reported that the patient reported that she received GARDASIL and on an unspecified date she became tired all of a sudden, she also suddenly developed lupus and her pancreas had to be taken out. She possibly might need chemotherapy in the future. Unspecified lab diagnostic studies performed. The patient sought unspecified medical attention. At the time of this report the patient had not recovered. Attempts are being made to verify the existence of an identifiable patient. No further information is available.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Inappropriate schedule of drug administration

Symptom Text: This is a case of pregnancy misuse (off label use, 33-year-old female vaccinated with a vaccine indicated for women under 26 years old). Initial information received on 10-MAR-2009 by a consumer, regarding his wife, for the pregnancy registry of GARDASIL. The 33-year-old female patient who was vaccinated on the 07-FEB-2009 with the second dose of GARDASIL (batch# and site not reported). It was reported that shortly after vaccination, the patient found out that she was pregnant, probably since the 14-FEB-2009. LMP date was 29-JAN-2009 and the patient was administered the vaccine on 07-FEB-2009. No adverse events have been reported. The patient has had a previous pregnancy. It is reported that the patient gave birth to a healthy child. Further information received from the patient's husband reported that on 19-JUN-2009, a high definition sonogram was performed with 20 weeks gestation with normal results. Next appointment with gynaecologist was scheduled on 30-JUN-2009. On 01-JUL-2009, the reporter was contacted again. Finally the appointment with gynaecologist was scheduled on the 02-JUL-2009. Further information reported by the patient's husband reported that the patient went to the social security gynaecologist, as scheduled, in mid July 2009. According to the reporter she was expecting a healthy male baby. Additional information was received from the patient's husband who reported the results of the blood work performed three weeks ago were normal. The result of the glucose screening test performed was also normal. It has been reported that delivery was expected on 04-NOV-2009. Follow-up information was received from the patient's husband who reported that the patient gave birth, without fetal suffering on 05-NOV-2009 a healthy male baby, 3.500 kg, 49 cm, 1 minute Apgar test score 09, 5 minute Apgar test score 10. The baby was born by cesarean section without postnatal complications. Upon internal review cesarean section was considered to be an other important medical event. Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Antibiotic therapy, Deep vein thrombosis, Feeling cold, Feeling hot, Hyperaesthesia, Lymphadenitis, Oedema peripheral, Paget-Schroetter syndrome, Pain in extremity, Paraesthesia, Thoracic outlet syndrome

Symptom Text: 07/12/2008 presented to doctor office with hx 5 days of "Right arm aching/swelling". Diagnosis? Rt. axillary adenitis placed on KEFLEX 500 mg tid. No known Hx trauma. Has sensation to touch/heat/cold etc.; yet "tingly". Dx DVT and Paget Schroetter syndrome Aug 08. I called Mom this evening to discuss further her question regarding patient's Gardasil vaccine series and her n/o blood clot. Patient has had something called Paget Schroetter syndrome which is a subset of thoracic outlet syndrome. This is usually due to inadequate space for the subclavian vein to run through at the shoulder due to anatomic variations in the 1st rib and clavicle (thus causing blood clot) or can also be from anterior scalene hypertrophy from repetive UE use. Patient used to participate in karate so this possibly may have put her at risk for this. I also reviewed office visit notes. I also reviewed the time course of patients Gardasil vaccines. Her initial visit here for RUE swelling was 6-7 mos following her 3rd Gardasil vaccine. I researched Gardasil and blood clots over the weekend and most of the alleged cases of causality are in clots that occurred within days to weeks following Gardasil vaccine. I reviewed this w/Mom and advised that, given the cause of patient's clot being an anatomic etiology, and the fact that her Gardasil series was several months prior to her blood clot, I don't think the two are related. However I again emphasized that we may never know the true answer and I am only relating my observations based on my research into Paget Schroetter Syndrome and Gardasil/blood clots. Mom said she was relieved to hear this, I think she was experiencing alot of guilt for having patient complete the Gardasil series, in light of the complications patient has had from surgery for the aforementioned syndrome (had a pneumothorax as a complication from surgery to remove part of a rib to make room for her R subclavian vessel). I also disc'd the VAERS reporting service and advised that we would submit patient info to them which may hel

MedDRA PT Drug exposure during pregnancy, Neonatal disorder

Symptom Text: Information has been received from a physician via CSL as part of a business agreement (manufacturer control # 20090513JV1) concerning a 15 year old female patient who on 10-JAN-2009 had her last menstrual period and then on 11-FEB-2009 received the first dose of GARDASIL (Lot not reported), and on 12-MAY-2009 received the second dose of GARDASIL (Lot not reported). Subsequently the patient was found to be pregnant. The patient's estimated date of delivery is 17-OCT-2009. Follow up information has been received from the physician via Pregnancy Questionnaire, concerning the patient who on 11-FEB-2009 was vaccinated with the first dose of GARDASIL (Lot number659659/0055X and Batch number K3111) and on 11-MAY-2009 (previously reported as 12-MAY-2009) with the second dose of GARDASIL (Lot number 660614/0241X and Batch number K2557). The vaccination occurred 4.5 weeks and 17.5 weeks after the last menstrual period. The pregnancy was confirmed by a clinical ultrasound. The patient did not had previous pregnancies. It was reported that the patient had excess alcohol use until pregnancy discovered. Follow up information was received which reported that the patient on an unknown date underwent a ultrasound which showed she was 18 weeks and 5 days. It was reported that the patient did not have infections/illness during pregnancy, did not take prescriptions drugs and did not have complications during pregnancy, labor or delivery. On 15-OCT-2009, the patient delivered a normal male child weight at 10 days of age was 3.2 Kg (birth weight not provided). The infant was born with a hypospadias, there were no other complications reported. It was reported that the discharge summaries were not available. Additional information has been requested.

Other Meds: unknown

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Systemic lupus erythematosus

Symptom Text: Information has been received from a physician concerning an approximately 25 year old female who in June 2009, was vaccinated with first dose of GARDASIL. The second dose was received on August 2009. There were no concomitant medications at the time of the vaccination. In approximately August 2009, the patient experienced an adverse effect. The patient consulted with a rheumatologist and was advised that she experienced drug induced SLE. Subsequently, the patient recovered from drug induced SLE. The patient refused to receive the third dose due to the event. The relationship of drug induced SLE to therapy with GARDASIL was unknown by both the rheumatologist and the reporter. The rheumatologist, however, advised the patient that although SLE can caused by other factors, drug induced SLE may be ascribed to the vaccine. The patient requested the reporter for a certification that she received two doses of the suspect therapy. Upon internal medical review, drug induced SLE was considered an other important medical event. Additional information is not expected.

MedDRA PT Arthralgia, Arthritis, Movement disorder

Symptom Text: Information has been received from a Health Authority under the reference number LY20091042 AM0910017, concerning a 17 year old female patient, described as an "adolescent in crisis", with psychiatric history but not treated, and with a difficult medical follow up, had received the first dose of GARDASIL (lot number 0153X, batch number NJ14700) via intramuscular route on 09-jun-2009. On 13-JUL-2009 she was hospitalized due to a violent pains in the right hip and a functional impairment. The presence of an articular effusion was noticed. Hip arthritis was diagnosed. The patient was given analgesics and anti-inflammatories, and was prescribed rest. Painful sedation was obtained. The patient was discharged on 16-JUL-2009, with a prescription of rest. The second dose of GARDASIL was planned in OCT-2009, but it was cancelled as the pain in the hips was still present. The following biological work-ups were performed: 13-JUL-2009: accelerated ESR, polynucleosis. 15-JUL-2009: erythrocyte serum in culture showed the absence of germs. 02-NOV-2009: Blood count and differential white count was normal, antinuclear antibodies were negative, c-reactive protein was normal and ESR was at 21. At the time of the report the patient was recovering. The health authority assessed the causal relationship between the reported events and the vaccination as "doubtful" (C2, S1, I1) according to the method of assessment. Other business partner numbers include E2009-10613. No further information is expected.

MedDRA PT Abnormal faeces, Decreased appetite, Diarrhoea, Dizziness, Dry mouth, Dyspepsia, Gastric disorder, Gastroenteritis, Gastrooesophageal reflux disease, Irritable bowel syndrome, Mucous stools, Nausea

Symptom Text: Information has been received from a healthcare professional on 17-SEP-2009. Case additional received from Health Authority (reference # PEI200902051) on 23-SEP-2009. It was reported by a gynaecologist that a 24 year old female was vaccinated with a first dose of GARDASIL (lot #1068U, batch #NH06410, route not reported) into the left upper arm on 27-MAR-2009, the second dose (lot #1427U, batch #NH17960) into the left upper arm on 25-MAY-2009. On an unspecified date in April 2009, the patient developed anorexia, dry mouth, abnormal stools with mucous stools, dizziness and relapsing nausea. Colonoscopy and gastroscopy showed no pathological findings. Neurologic psychiatric examinations were planed. Unspecified treatment was carried out. At time of report, symptoms were still ongoing. Follow-up information received on 18-NOV-2009. Several examination reports were provided. The case has to be updated due to hospitalization of the patient. Since beginning of June 2009 the patient complained of typical signs of gastroesophageal reflux disease. Under treatment with omeprazol symptoms did not improve. On 24-JUN-2009 a gastroscopy was carried out and showed no pathological findings. The diagnosis of "non-erosive reflux disease" was established. Histological examination showed normal results. On 11-JUL-2009 the result of a stool sample showed no evidence of salmonella, shigella, yersiniae and campylobacter. On 21-JUL-2009 a coloscopy was carried out and also showed normal results. No histological findings in iliac mucosa. On 07-AUG-2009 a thoracic radiological imaging was carried out and showed normal results for heart and lung. From 09-JUL-2009 to 10-JUL-2009 the patient was hospitalized because of changing stools and mucous diarrhea. A non-infectious gastroenterocolitis was diagnosed. The patient was treated with spasmolytics and not specified infusional therapy and recovered quickly. On 28-AUG-2009 a blood sample was taken and showed following normal result for gliadin antibodies in serum: Gliadin IgA 1.1 u/ml (normal:

MedDRA PT Drug exposure during pregnancy, Stillbirth

Symptom Text: Information has been received from an investigator concerning a female who entered a study, title as stated above. On 23-APR-2009 was vaccinated with the first dose of GARDASIL (LOT# not reported). The patient's last menstrual period was last week of April 2009. The pregnancy is normal to date. Patient will be followed by study, but not receive any other doses of GARDASIL. Follow-up information was received from a caller who wanted to report a pregnancy registry for a clinical trial for GARDASIL. Unable to confirm information. In the follow-up the investigator stated they were no longer giving the patient GARDASIL and asked if it would be okay to only report the information to their contact for the clinical trial and if they need to call again. In the follow-up the investigator stated that the patient who had been approximately 28 weeks pregnant had a stillbirth on 21-NOV-2009. The relationship between the stillbirth at 28 weeks and GARDASIL was not reported. Upon internal review stillbirth at 28 weeks was considered to be an other important medical event. No further information was reported.

MedDRA PT Arthralgia, Condition aggravated, Cough, Headache, Iron deficiency anaemia, Joint stiffness, Lupus nephritis, Nasopharyngitis, Pleurisy, Pyrexia, Renal impairment, Steroid therapy, Systemic lupus erythematosus

Symptom Text: Initial case was reported as serious on 19-NOV-2009 by Health Authority (093799). It was reported that a 16-year-old girl was vaccinated with the second (batch number NH01650, Lot # 1145U, route and dose not reported) and the third dose (batch number NJ03220, i.m. route 0.5 ml) of GARDASIL on 29-DEC-2008 and 05-MAY-2009 respectively. HA coded SLE (systemic lupus erythematosus) (causality unclassifiable due to no supporting documentation of a causal relationship except for a relationship in time) with onset on unspecified date in June 2009. In February 2009 the girl went to the doctor due to recurrent headache. Iron deficiency anemia was established and DUROFERON (GSK) was prescribed as treatment. At the end of April 2009, prior to vaccination with dose three, the girl caught a cold with fever and non productive cough. Shortly after vaccination with the third dose the girl experienced arthralgia in hands, finger and knees. Progressive problems with joints (stiffness), kidney dysfunction and affected hematology (no details specified) quickly followed. Investigation at the hospital established SLE and SLE-nephritis stage III based on her symptoms (not specified which) in combination with a positive ANA test and pulmonary X-ray that showed left sided pleurisy. The patient is put on treatment with CELLCEPT (mfr Roche) and steroids (not specified, mfr unknown). No adverse event was reported following vaccination with dose of GARDASIL on 30-OCT-2008 (Batch # NH01650, lot #1145U). The outcome is not yet recovered. No further information is available. Case is closed. Systemic lupus erythematosus was considered to be an other important medical event. Other business partner numbers include E2009-10760.

MedDRA PT Abasia, Activities of daily living impaired, Dizziness, Electrocardiogram ambulatory, Palpitations, Ventricular extrasystoles

Symptom Text: Information has been received from a cardiologist and a receptionist concerning a 17 year old female with no pertinent medical history or drug reactions/ allergies who on 20-NOV-2009 was vaccinated with a dose of GARDASIL. Concomitant therapy included SEASONALE. The patient was nasally vaccinated on 19-NOV-2009 with H1N1. The reporter mentioned that on 20-NOV-2009 the patient received GARDASIL and within minutes could not walk out of the office. It was stated that the patient had premature ventricular contractions. The physician felt a significant disability was the patient "can not drill team". The receptionist stated that the patient was a new patient of the cardiologist and was first seen on 24-NOV-2009. The patient sought a physician in office for medical attention. The patient had the following lab/diagnostics tests: CBC, telemetry, PSH and troponin all of which were normal. At the time of reporting the patient had not recovered. The physician considered the patient unable to walk out of the office, premature ventricular contractions and can't drill team" as disabling. Additional information has been requested. 12/3/2009 Cardio Consult records for 11/24/2009, patient seen for c/o's palpitations and lightheadedness. EKG done at PCP office was abnormal noting PVC's, Tx Holter monitor, recommended addition of fish oil and magnesium

MedDRA PT Congenital anomaly, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician concerning a female who in approximately 2009 was vaccinated with all three doses of GARDASIL. About one month after third dose of vaccine the patient experienced drug exposure during pregnancy. Pregnancy ultrasound revealed congenital anomalies of the fetus - one leg is shorter, one hand without fingers. The physician is not sure if congenital anomaly was related to therapy with GARDASIL. Additional information has been requested.

Other Meds: Unknown

Lab Data: Ultrasound, 09?, anomaly- one leg is shorter, one hand without fingers

MedDRA PT Anogenital warts, Neoplasm malignant, Papilloma viral infection, Vulvovaginal human papilloma virus infection

Symptom Text: Information has been received from a physician concerning a 38 year old female with no medical history or drugs allergies, who in April 2009, was vaccinated with a 0.5 mL first dose of GARDASIL. In June 2009 the patient received a second dose of GARDASIL. There was no concomitant medication. The patient had a routine pap smear in October 2009 which came back positive for HPV in the cervical area and condyloma in vaginal area and were considered to be cancer. The patient received laser treatment as an outpatient. The patient sought unspecified medical attention. At the time of this report the patient was recovering. Upon internal review pap smear positive for HPV and condyloma were determined to be an other important medical events. Additional information has been requested.

MedDRA PT Decreased appetite, Fatigue, Nausea, Weight decreased

Symptom Text: Information has been received from a physician on 23-NOV-2009 concerning an 18 year old female patient who on 25-FEB-2009 was vaccinated with the first dose of GARDASIL (lot# and site of administration not reported). She received the second dose and the third dose of GARDASIL (lot# s and sites of administration not reported) on 24-APR-2009 and late AUG-2009 respectively. Concomitant therapy included hormonal contraceptives (unspecified). At the beginning of AUG-2009, date before the third vaccination, the patient experienced significant fatigue, nausea followed by anorexia with loss of weight from 51kg to 47.5kg ie loss of 3.5kg in three months. After the third dose, the patient was still loosing weight. No myalgia, diarrhea, lymph node or tachycardia were observed. In AUG-2009 complete blood count, transaminases and C-reactive protein (CRP) were normal. In Nov-2009, complete blood count, CRP, serologies for toxoplasmosis and infectious mononucleosis and liver parameters were normal. The patient should be hospitalized in the following days (week 48) to perform additional work-up to explore the loss of weight. At the time of this report, the patient had not yet recovered. The patient's adverse events were considered to be other important medical events. Other business partner numbers included: E2009-10881. Additional information has been requested.

Other Meds: hormonal contraceptives (unspecified)

MedDRA PT Angioedema, Eye swelling, Lip swelling, Pruritus generalised, Swelling face

Symptom Text: This case was initially reported by the health authority on 24-NOV-2009. ADR 20529946. Information has been received from a health professional concerning a 17 year old female patient with no known prior allergies who on 12-NOV-2009 was vaccinated intramuscularly with a dose of GARDASIL (lot# and site of administration not reported). On an unspecified date, the day after having the vaccination in school, the patient had woken up with facial, periorbital and lip swelling, and widespread itching. The reporter stated that the events implied a significant allergy to GARDASIL. On an unspecified date, the patient recovered. The reporter considered the events to be serious as they were medically significant. The agency coded the events angioneurotic oedema, facial swelling, itching generalized, lip swelling and periorbital swelling. Case is closed. Other business partner numbers included: E2009-10879. No further information is available.

MedDRA PT Optic neuritis, Visual impairment

Symptom Text: Information has been received from the health authority (HA) under the reference number MA20091961 concerning a 16-year-old female patient who had received the second dose of GENHEVAC B (batch number not reported) on 03-JUL-2009 and the second dose of GARDASIL (batch number not reported) on 12-AUG-2009 and in late August 2009, she experienced the first signs of retrobulbar optic neuritis. Retrobulbar optic neuritis was diagnosed on 12-NOV-2009. The Health Authorities coded also subjective visual disturbances as manifestation. Cerebral MRI was normal. The patient had received the first dose of GENHEVAC B (batch number not reported) on 23-APR-2009 and the first dose of GARDASIL (batch number not reported) on 25-MAY-2009. The patient had a family history of epilepsy in a sister and mental retardation in another sister. The Health Authorities assessed the causal relationship between the reported reaction and vaccination as "doubtful" (C1 S1 I1) according to the method of assessment. The patient's optic neuritis retrobulbar was considered to be an other important medical event. Other business partner numbers include E2009-10982.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician through the pregnancy registry for GARDASIL, concerning a 17 year old female patient with no know drug allergies who on 28-JUL-2008 was vaccinated with the first dose of GARDASIL (Lot #660391/0063X) IM 0.5 mL. On 29-SEP-2008, the patient was vaccinated with the second dose of GARDASIL (Lot 661442/0527X) IM 0.5 mL. Concomitant therapy included YAZ. The physician reported that the patient was pregnant. No adverse effect was reported. The patient not had any labs test done. The patient's LMP was 01-AUG-2008 and EDD 08-MAY-2009. The patient sought medical attention at office visit. There was no product quality complaint. Follow-up information was received from a certified physician's assistant who reported that the patient had a spontaneous abortion 1 week following vaccination (approximately on 06-Oct-2008). Upon internal review "spontaneous abortion" was considered an other important medical event. Additional information is expected.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a gynaecologist via SPMSD concerning a 15-year-old female patient who was vaccinated with a first dose of GARDASIL (lot#, injection route and site not reported) on 19-JAN-2009. On 19-JAN-2009 pregnancy test was negative. Pregnancy test was positive now. Her last menstrual period was mid of Dec- 2008. The reporter assumed that GARDASIL was vaccinated during early pregnancy. No adverse effect was seen at the time of reporting. The estimated end of pregnancy will be on 08-Oct-2009. Follow-up information received on 27-NOV-2009. Case was upgraded due to pregnancy termination. Information received by a phone call with the reporting physician. A voluntary termination of pregnancy was performed in 11th week of gestation due to personal reasons and the juvenile age of the patient. Up to this time the course of pregnancy was normal. Pregnancy termination and drug exposure during pregnancy were considered to be other important medical events. Case is closed. Other business numbers include E2009-01146.

MedDRA PT Abortion induced, Anaemia, Drug exposure during pregnancy, Pregnancy

Symptom Text: Information has been received from a 24 year old female patient, for the Pregnancy Registry for GARDASIL, who on 04-AUG-2009 was vaccinated with a first dose of GARDASIL (route and lot # unknown). On approximately 20-AUG-2009, the patient became pregnant after receiving GARDASIL. The LMP was on approximately 20-AUG-2009 and EDD was on approximately 27-MAY-2010. The patient sought unspecified medical attention. At the time of this report the patient's outcome was unknown and the patient had 7 weeks gestation. Follow up information has been received from the nurse practitioner, for the Pregnancy Registry for GARDASIL, concerning the 24 year old female (patient 4 of 4) without pertinent medical history, no drug reactions or allergies reported, who on 04-AUG-2009 was vaccinated with a 0.5 mL first dose of GARDASIL, intramuscular route (lot # unknown) No concomitant medication. The patient elected to abort the pregnancy on 19-OCT-2009. There was no congenital anomaly known related to the baby. The patient also experienced anemia related to the abortion. The nurse practitioner reported that this was the second patient's abortion and it was determined that she was RH negative and she was treated with RHOGAM. The LMP was on 21-AUG-2009. Additional lab diagnostic studies performed were unspecified. The patient sought medical attention at the physician's office. At the time of the report the patient was fine. Upon internal review, the abortion was considered to be an other medical event of medical importance. Additional information has been requested.

MedDRA PT Abortion missed, Drug exposure during pregnancy

Symptom Text: Information has been received from a specially trained medical technician for the Pregnancy Registry for GARDASIL vaccine, concerning a 26 year old female with diabetes and no drug reaction/allergies, who on 21-Jun-2007, 25-Aug-2007 and 28-May-2008 was vaccinated intramuscularly with 0.5 ml of first (lot# 660389/1968U), second (lot# 658100/0525U) and third (lot# 658556/1060U) doses, respectively, of GARDASIL vaccine and is pregnant. Concomitant therapy included NOVOLOG. On 07-Jun-2008 the patient took home pregnancy test that tested positive (LMP = 05-May-2008). Unspecified medical attention was sought, the patient was seen in office. No adverse event reported. At the time of this report the outcome is unknown. Follow-up information has been received from a person in the physician's office on 24-NOV-2009 who reported that on 21-JUL-2008 the patient had an ultrasound performed which identified a "missed AB", which was dated at 11 weeks gestation by LMP. The patient did "fine" after that, recovered. Upon internal review, "missed AB" was determined to be an other important medical event. This is one of two reports concerning the same patient (WAES#0911USA04901). A lot check has been initiated. No further information is available.

Other Meds: NOVOLOG

Lab Data: Ultrasound, 07/21/08, identified a "missed AB"; beta-human chorionic, 06/07/08, positive

History:

Prex Illness: Pregnancy NOS (LMP = 5/5/2008); Diabetes

MedDRA PT Hypotension, Loss of consciousness

Symptom Text: Case received from Health Authorities on 23-NOV-2009 under the reference number N200911-448 and transmitted by SPMSD. Case received from the Health Authority, having a follow up in the narrative, even though the initial version was never received. A female patient received the third dose of GARDASIL (Lot number: NJ28290, Batch number NK30860) by intramuscular route on 12-OCT-2009. The patient had no adverse reaction history to vaccinations with GARADASIL. Adverse reaction history to other drugs was unknown. Few minutes after vaccination, the patient experienced severe hypotension with loss of consciousness. The adverse events evolved positively, without any drugs being used. At the time of reporting, the patient had recovered. Follow up received by the Health Authorities on 12-NOV-2009; upon contact with the reporter, the seriousness criteria was changed to serious. Other business partner numbers include E2009-10984. Hypotension and loss of consciousness was considered to be as other important medical event by the reporter. No further information expected.

MedDRA PT Gastrointestinal disorder, Myelitis transverse, Neurological symptom, Nuclear magnetic resonance imaging abnormal, Paraplegia

Symptom Text: Information has been received from Health Authority, (H.A. reference #: DK-DKMA-20093924), concerning a 12 year old females patient (weight: 55kg, height: 169 cm) with no concurrent disease who was vaccinated IM with the third dose of GARDASIL (lot number: 0747X, batch number NJ38950, site of administration not reported) on 13 JUL-2009. On 05-AUG-2009, the patient developed myelitis transverse and subsequently and subsequently incomplete paraplegia at neurological level Th9. The patient was admitted to hospital (date and duration not reported). The score according to ASIA impairment scale was AIS-B. The patient's bladder and colon were affected, in addition to muscle function and sensibility (not further specified). MR scan column throacalis was performed on 05-AUG-2009 and 11-AUG-2009. It was reported that the result of the MR scan revealed signal changes on medulla and on conua medullaris that were consistent with myelitis transverse. Signal fluid was examined for Herpes Simples virus type 1 and 2, varicella zoster virus, enterovirus, Hycoplasma pneumoniae and adenovirus. Spinal fluid was negative for all tests, except Mycoplasma pneumonaie IgG. Faeces were negative for enterovirus. A swab of tonsillis was negative for Mycoplasma pneumoniae. Aquaporin antibody test, Ana Hep-2-screening, gliadin antibody IgA and IgG tests, tissue glutaminase antibody test, Chlamydia test, GQlb gangliosid antibody test were all negative. The patient had not concurrent disease. The patient was vaccinated with the first and second dose of GARDASIL (lot number, batch number and site of administration not reported) on 15-Jan-2009 and 12-Mar-2009, respectively. No adverse reaction was reported. It was reported that the patient had not recovered. Other business partner number is included E2009-10977. No further information is available.

Other Meds: Unknown

Lab Data: magnetic resonance imaging, 05Aug09, Columna thoracalis, see narrative; magnetic resonance imaging, 11Aug09, Columna thoracalis, see narrative; spinal tap, For enterovirus: negative; diagnostic laboratory test, Aquaporin 4 antibody test:

MedDRA PT Condition aggravated, Convulsion, Syncope

Symptom Text: Information has been received from a nurse practitioner concerning "several patients" who were vaccinated with GARDASIL. The nurse reported that after receiving GARDASIL the patient fainted. The patients sought unspecified medical attention. Follow-up information has been received from the nurse practitioner. One patient (age and gender not reported) had a known seizure disorder. The nurse practitioner could not confirm that these events were definitely related to vaccination with GARDASIL. The practice began observing the patient for 15 minutes after the patient received vaccination as a result of the event. Upon internal review, seizure disorder was determined to be an other important medical event. This is one of three reports received from the same source. Additional information has been requested.

MedDRA PT Abdominal pain, Appendicectomy, Appendicitis, Blood test normal, Colonoscopy normal, Constipation, Diarrhoea, Endoscopy upper gastrointestinal tract, Food allergy, Frequent bowel movements, Headache, Histamine intolerance, Hordeolum, Lactose intolerance, Lip dry, Muscle spasms, Nasal congestion, Nausea, Oropharyngeal blistering, Parosmia, Stool analysis abnormal, Vomiting

Symptom Text: Information has been received from a gynaecologist concerning a 15 year old female patient who in December 2007 was vaccinated with the third dose of GARDASIL (lot#, injection route and site not reported). The gynaecologist provided a summary created by the patient in which she described the course of her medical report. Following the vaccination she complained of abdominal pain and cramps with increased frequency. In August 2008, the patient experienced appendicitis. In September 2008, the patient developed diarrhoea, obstipation, stye, dry lips, swollen nasal mucosa, headache, nausea, vomiting, sensitivity to smells and blistering of mouth. In the end of October 2008, the patient had an appendectomy but symptoms persisted. A colonoscopy and gastroscopy were carried out on unspecified dates and showed no pathological findings. Also blood analysis (no further specified) showed normal results. In March 2009, a blood and stool sample were taken and showed allergy to several foods and a lactose and histamine intolerance. After corresponding diet, symptoms improved. The final outcome was not reported. The physician stated that the mother of the patient considered a causal relation between vaccination and the symptoms. Other business partner number included: E200911051. Case closed. No further information is available.

MedDRA PT Convulsion, Dizziness, Fatigue, Headache, Nausea, Tremor

Symptom Text: Information has been received from SPMSD as part of a business agreement. Initial case reported on 30-NOV-2009 by the mother of the patient to SPMSD. Additional information was received from HCP on 01-DEC-2009. Case was considered serious due to other medically important condition (seizure). It was reported that a 13-year old girl was vaccinated with GARDASIL (MSD, first dose, batch number NJ33910, route not reported) on 09-OCT-2009. Three weeks after vaccination, on 30-OCT-2009, the girl experienced a seizure with convulsions, shaking, headache, dizziness and nausea. The attack lasted for one hour. According to the mother, the girl was never unconscious nor did she experience any convulsions, but according to the medical record, the patient did experience convulsions during the seizure. At the time of the event, the patient was visiting with a friend's family. The girl went to the hospital where she was treated with sedatives (mfr unknown) and headache tablet (mfr unknown). Blood and urine samples (no details reported) taken on 30-OCT-2009 could show no finding. Afterwards she was tired, but then ok. The girl has no memory from the actual seizure. Some days later, on 04-NOV-2009, the girl experienced the same seizure once again, same symptoms, this time during school hours. The school phoned her father, who came and saw the daughter in convulsions. The girl went to the emergency room in an ambulance. Blood tests (no details reported) taken on 04-NOV-2009 showed no finding. An MR taken on 06-NOV-2009, found nothing un-normal. Today the girl is feeling ok, but is under investigation for epilepsy. The outcome is recovered. Case is closed. This was originally reported by a health care professional. Other business partner numbers include E2009-11039.

MedDRA PT Clonus, Laboratory test normal, Nuclear magnetic resonance imaging brain normal, Partial seizures, Pyrexia, Vaccine positive rechallenge, Virus serology test negative

Symptom Text: Information has been received from a Health Authority (case no. 107477, local case n. IT561/09) concerning a 20 year old female who on 20-NOV-2008 the patient was vaccinated with the third dose of GARDASIL (batch number not reported). On 21-DEC-2008 the patient presented with high fever and clonus to the fingers of the right hand. It was also reported that the patient was vaccinated the first dose of GARDASIL on 02-MAY-2008 following which on 12-JUN-2008 she experienced clonus of the head towards the right side and on 03-JUL-2008 a feeling of the face pulling to the right and aphasia with loss of consciousness. The second dose of GARDASIL vaccine was administered on 17-JUL-2008 and the patient experienced a similar reaction. The patient was hospitalized, routine labwork within normal limits; cerebrospinal (CSP) exam with serology for neurotropic viruses was negative; magnetic resonance imaging (MRI) brain negative; electroencephalography (EEG) showed continuous partial epilepsy. She was treated with KEPPRA. The reported outcome is not recovered. The case is closed. Other business partner number included E2009-11086.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Antiphospholipid syndrome, Asthenia, Autoimmune disorder, Bronchospasm, Dizziness, Dyspnoea, Headache, Heart rate increased, Hyperventilation, Hypoglycaemia, Malaise, Oxygen saturation decreased, Pallor, Palpitations, Presyncope, Pulmonary embolism, Syncope, Thrombosis, Vertigo, Vision blurred, Wheezing

Symptom Text: My daughter was a freshman (2006) in college when she fainted outside in the snow on campus in the month of January. She was taken to the student health center, then the hospital and released. She was mistakenly diagnosed with anxiety. The college nurse contacted me and insisted that something else was very wrong because my daughter's oxygen level was below normal. Upon the nurse's urging, I took my daughter to a pulmonologist. She was given a chest scan. I was told to admit her to the hospital immediately due to multiple pulmonary embolisms in her lungs. She was hospitalized for 5-7 days. She was then under the care of a hematologist who diagnosed her with an auto-immune disorder called anti-phospholipid antibody syndrome. Neither side of the family has any type of auto-immune disorder. Three years later she continues to take a blood thinner. We do not know how long she was functioning with the clots in her lungs before the fainting incident. I believe that the college nurse saved her life. This past August on the news, it was mentioned that GARDASIL has been found to cause fainting, clotting and auto immune disorders. I was suspicious that the vaccine caused this disorder in my daughter so when I heard the news report, my fears were confirmed. This clotting diagnosis occurred within 6 months of the time frame that she had the 2 of 3 recommended series of this vaccine. (The first dosage was in August. The second dosage was given in November). The manufacturer of this vaccine continues to aggressively market this product despite the problems associated with it. ```records received 12/10/09. Immunization rec. for DOS 11/03/06. Rec. reflects no illness on date of immunization. ```records received 12/10/09. Student health clinic rec. for DOS 01/17/07-04/19/07. MedDRA PT Back pain, Convulsion, Dizziness, Headache, Neck pain, Tonic clonic movements

Symptom Text: Information has been received from a physician concerning a 17 year old female patient who started GARDASIL on an unknown date. The patient has no relevant medical history, and past drug includes no prior reactions to GARDASIL. On 01-DEC-2009 the patient was vaccinated with her third dose of GARDASIL (lot # 661703/0651X) in the right deltoid. Concomitant therapy included hormonal contraceptives (unspecified). After getting this injection, the patient reported feeling faint to the nurse who was still in the room, the nurse observed the patient to have tonic-clonic movements. The patient's blood pressure and pulse were monitored and reported to be normal, she was observed by the physician to be doing well and he felt that she was okay to go home. On 02-DEC-2009 a follow-up phone call was made to the physician's office stating that the patient had a severe headache, back ache and neck pain. He did not get to speak directly to the patient or her mother. Upon internal review, seizure/convulsion was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Blood test, Caesarean section, Drug exposure during pregnancy, Labour complication

Symptom Text: Information has been received from a nurse practitioner and a 26 year old female consumer for the Pregnancy Registry for GARDASIL concerning herself who on 19-MAY-2008 was vaccinated intramuscularly in the deltoid with her first dose of GARDASIL (lot# not reported) and became pregnant. There was no concomitant medication. The patient's LMP was 19-MAY-2008 and EDD was 23-FEB-2009. Subsequently the patient experienced no adverse symptoms. The patient sought medical attention with an office visit on an unspecified date. The patient had blood work and a urine pregnancy test to confirm the pregnancy. The patient's outcome was not reported. Follow-up information was received from the consumer who stated that she had a baby boy who is now nine months old; healthy and normal with no problems. She also said her pregnancy was "very good", and she was one week overdue when she went into labor. Additionally she reported an "emergency" cesarean section during labor because the baby "wasn't coming down" and had the umbilical cord wrapped around his arm and after a while" he couldn't take it any more". The reporter stated the baby was fine after he was born and she recovered very well from the surgery. Upon internal review, umbilical cord abnormality was considered an other important medical event. Additional information is not expected.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Hypoaesthesia oral, Swollen tongue, Vaccination complication, Vision blurred

Symptom Text: Information has been received from a certified medical assistant concerning a 21 year old female with asthma and no known drug allergies who on 23-Nov-2009 was vaccinated intramuscularly with her second 0.5ml dose of GARDASIL (lot number 661046/0381X). On 23-NOV-2009, after receiving the vaccine, the patient experienced tongue swelling numbness and blurred vision. Subsequently, the patient recovered from tongue swelling numbness, tongue swelling numbness and blurred vision on the same date. The patient sought medical attention by making a phone call and by contacting the emergency squad. Follow up information was received from a certified medical assistant concerning the 21 year old female. She reported that the patient received GARDASIL vaccination on the following dates: dose # 1 was given on 10-AUG-2009, lot number 661046/0381X and dose # 2 was given on 23-NOV-2009 at 1:45p.m., lot number 661046/0381X (into the left deltoid). The patient did not receive any concomitant vaccinations when the GARDASIL vaccinations were administered. The C.M.A stated that the patient had the reaction to the second dose of GARDASIL when she went back to school. The patient was complaining of tongue swelling, numbness and blurred vision. The patient was a student at the University. The patient called the physician's office and was advised to go to the nearest Emergency Room. An Ambulance was called to take the patient to the Hospital and stabilized the patient. The patient was treated for her reaction to the GARDASIL vaccination (treatment unknown to the reporter). The patient did not go to the Hospital. The patient recovered on 23-NOV-2009. The patient stated that she would not receive the third dose of GARDASIL. The C.M.A. stated that she called the patient to inquire how she was doing and the patient did not return the phone call. The patient did say she received a shot but was not sure. The reporter considered that tongue swelling, numbness and vision blurred required intervention to prevent serious criteria. Additional informa

MedDRA PT Bronchospasm

Symptom Text: This case was reported by a regulatory authority (# ES-AGEMED-908985234) and described the occurrence of bronchospasm in a 13-year-old female subject who was vaccinated with (ENGERIX B, GlaxoSmithKline), (non-gsk) (GARDASIL). On 7 August 2009 the subject received unspecified dose of ENGERIX B (intramuscular), 1st dose of GARDASIL (intramuscular). On 7 August 2009, less than one day after vaccination with ENGERIX B and GARDASIL, the subject experienced bronchospasm. The regulatory authority reported that the event was clinically significant (or requiring intervention). On 7 August 2009, the event was resolved. The regulatory authority reported that the event was possibly related to vaccination with ENGERIX B and GARDASIL.

MedDRA PT Solar urticaria, Vaccine positive rechallenge

Symptom Text: Case received from the Health Authorities under the reference number L200911792 on 30-NOV-2009: This case may be a duplicate of a non serious case E2009-02047 but no confirmation was obtained to date. A 16 year old female patient with medical history of vertiginous syndrome had received the first dose of GARDASIL (batch # NJ040530, lot # 0747X) via intramuscular route on 04-FEB-2009. On 05-FEB-2009 the patient presented with urticarial reaction on the parts of the body exposed to the sun (including face). Event maintained without recovery (clarification has been requested). The patient received a corrective treatment with desloratadine, dimetindeno, hydroxysine, dexamethasone and ebastine 10 mg. On 22-APR-2009, the patient received the second dose of GARDASIL (batch # NJ46700, lot # 0773X) and she experienced the same urticarial reaction. The reaction persisted without recovery. The Health Authorities considered the case as 'other medically important condition'. Other business partner numbers include: E2009-11415.

MedDRA PT Gastrooesophageal reflux disease, Labour complication

Symptom Text: Information has been received from a nurse, for the Pregnancy Registry for GARDASIL, concerning a baby whose mother was vaccinated with a first dose of GARDASIL (Lot# 660553/0070X) on 21-JUL-2009 and on 18-SEP-2008 was vaccinated with a second dose of GARDASIL (660616/0570X). The baby's mother LMP was on 20-AUG-2008. It was reported that the baby was born via c-section on 09-JUN-2009 (WAES# 0810USA02706). The baby's birth weight was 6 lbs 11oz. The nurse indicated that the baby had "intolerance to the labor" and problems with gastroesophageal reflux disease but otherwise "was a well baby, no congenital anomalies". At the time of this report, the outcome of the baby was unknown. Upon internal review intolerance to labor was considered to be an other important medical event. Additional information is not expected.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Pregnancy test urine positive

Symptom Text: Information has been received from a physician assistant, for GARDASIL, a Pregnancy Registry product, concerning a 15 year old female patient with AMOXICILLIN and PENICILLIN allergies and no medical history who on 28-SEP-2009 was vaccinated with the first 0.5ml dose of GARDASIL (lot# 661531/1311X) in the left arm. Concomitant therapy included FLUMIST intranasal. On 16-OCT-2009, the patient was seen for a regular check up and her blood was drawn. The physician assistant reported that the patient must had thought the blood work was a pregnancy test because she told her mother she was pregnant. On 22-OCT-2009, the patient and her mother came to the clinic. Urine pregnancy test was taken with a positive result. Her LMP was 28-AUG-2009. Expected date of delivery was 04-JUN-2010. The patient was not experiencing any adverse effects. At the time of the report, the patient's outcome was unknown. Follow-up information has been received from a physician assistant who reported that the patient experienced a miscarriage on 07-NOV-2009. At the time of the report, the patient's outcome was unknown. Upon internal review, miscarriage was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Amnesia, Confusional state, Loss of consciousness, No reaction on previous exposure to drug, Tonic clonic movements

Symptom Text: Information has been received from a Health Agency (Case No. 107870), concerning an 11 year old female who was vaccinated on 11-NOV-2009 with the third dose of GARDASIL (Lot No. NJ37700) via intramuscular route. On the same day, a few minutes post-vaccination, she presented with generalized tonic-clonic jerks accompanied by loss of consciousness (lasting a few seconds), followed by slight confusional state and amnesia of the event. She was laid down with her lower limbs raised, her vital signs (blood pressure and cardiac frequency) were monitored and were within normal range. She was held for about 80 minutes. The event resolved in a few minutes. It was also reported that the patient did not experience any adverse effect after the 2 previous doses of GARDASIL. The event was reported as not serious by both Health Agency and the reporter and upgraded to serious by the Company. To note, Health Authority and coded only "tonic-clonic" epilepsy. The outcome is recovered on 11-NOV-2009. Case is closed. The originally reporting source was unknown. Other business partner numbers include E2009-11213. No further information is available.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Amnesia, Asthenia, Complex partial seizures, Depressed level of consciousness, Eye movement disorder, Headache, Loss of consciousness, Neurosensory hypoacusis, Tonic convulsion

Symptom Text: Information has been received from Health Authority (reference number ES-AGEMED-908461236) on 10-DEC-2009 concerning a 14 year old female patient who on 05-NOV-2009 was vaccinated with a dose of GARDASIL (lot#, route, site of administration not reported). It was reported that after vaccine administration, the patient presented a deterioration of consciousness presenting rhythmic oscillating ocular movements, tonic movements in right upper limb, distal movements in lower limbs and loss of consciousness (GSC<8). In the emergency room she recovered consciousness presenting with amnesia of the episode, headache and generalized weakness. Afterwards, during the patient's hospitalization (hospitalization date not reported), she showed a satisfactory evolution and was discharged without symptoms (discharge date not reported). A magnetic resonance imaging (MRI), electrocardiogram (EKG) and electroencephalography (EEG) (date not reported) were performed without findings. Left neurosensory hypoacusis was observed, possibly related with an auditory neuropathy. Neurosensory hypoacusis and complex partial seizures were considered to be other medically important events by the reporter. Other business partner number included: E200911419. No further information is available.

MedDRA PT Gastroschisis, Intensive care, Premature baby, Small for dates baby

Symptom Text: Information has been received from a physician for the pregnancy registry for GARDASIL concerning a 22 year old female with bacterial vaginosis who was vaccinated intramuscularly with the first 0.5 dose of GARDASIL in the left upper arm in August 2008 her first month of previous pregnancy, reported in (WAES # 0809USA00445), the second dose of GARDASIL in her right upper arm in October 2008 with no other vaccines was given on this date and the third dose of vaccine on her left arm on 04-NOV-2009. Concomitant therapy included 250 mg FLAGYL for bacterial vaginosis infection, folic acid 3 weeks after the visit and the flu vaccine in her right arm. The patient delivered a male child by caesarean section due to gastroschisis 3 months ago. Child had complication gastroschisis, abdominal defect, which required surgery and longer stay at the hospital after birth. Child was being seen by specialist. Follow up information was received from the physician concerning the patient with no obstetric history as well as no medical history or concurrent conditions who was vaccinated with her first, second and third dose of GARDASIL on 05-AUG-2008, 09-OCT-2008 and 04-NOV-2009 respectively. Concomitant therapy included FLAGYL folic acid from 07-AUG-2008 and influenza virus vaccine on 04-NOV-2009. Amniocentesis indicated that the patient was 4.5 months pregnant (LMP: 12-AUG-2008; EDD: 19-MAY-2009). The results of the amniocentesis were "negative". On 12-AUG-2009, at 25 weeks of gestation, the patient delivered an abnormal male baby weighting 4 pounds, 18 cm in length with head circumference of 35. The baby was born by caesarean section with gastroschisis. The mother had not complication during pregnancy and needed caesarean section because of the baby's gastrochisis. The mother did not experience any infections or illnesses during pregnancy. The infant was still in NICU as of today. Other medication used during this pregnancy included prenatal vitamin, 1 tablet, daily. Follow up information was received from the physician via telephone

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Cleft lip and palate, Congenital anomaly, Drug exposure during pregnancy, Myringotomy

Symptom Text: Information has been received from a health professional, for the Pregnancy registry for GARDASIL, concerning a male baby patient whose 24 year old mother with tobacco use and a history of 1 pregnancy and 1 live birth was vaccinated intramuscularly with the first, second and third 0.5 ml doses of GARDASIL on 03-DEC-2007, 04-FEB-2008 and 04-JUN-2008, respectively (lot # of the 2nd dose: 655327/1287U; lot # of 3rd dose: 655604/0052X). There was no concomitant medication. The mother was two weeks pregnant while receiving the third dose of GARDASIL. The pregnancy test was positive. On 23-SEP-2008, ultrasound was performed with normal result. On 15-OCT-2008, maternal serum alpha-fetoprotein (MSAFP) was performed with negative result. On 13-FEB-2009 (Weeks from LMP: 39), the baby was born with congenital anomaly cleft palate, weight: 8 pounds 3 oz and Apgar score 8/9. As of 01-JUL-2009, the outcome of cleft palate was unknown. Follow-up information was received from a nurse who reported that the baby was born with congenital anomaly cleft palate and cleft lip, height: 22 inch. The baby visited a cleft craniofacial center on 18-FEB-2009 and visited an audiology center on 09-JUN-2009. At the time of reporting, the outcome of cleft palate and cleft lip were unknown. Follow-up information was received from a nurse via medical records indicating that the baby's Apgar was 8 at 1 minute, 9 at 5 minutes. Birth weight was 8 pounds and 5 ounces. He failed the newborn hearing screen of the left. The baby was born with cleft lip unilateral complete and cleft palate unilateral complete. On 25-FEB-2009, the infant was 12 days old. This was a well visit. It was noted that the cleft lip and palate would be repaired when the child was 4-6 months of age. On 04-SEP-2009 the patient had cleft lip repaired and had myringotomy with tubes. On 17-NOV-2009 the patient presented for a scheduled 9 months well child visit. He had ear tubes. Physical exam showed tympanic membranes normal landmarks, no fluid or erythema bilaterally. At the time of

Seriousness: HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abdominal pain, Activities of daily living impaired, Back pain, Bedridden, Bowel movement irregularity, Constipation, Diarrhoea, Diplegia, Fall, Haematochezia, Haemorrhoids, Hypoaesthesia, Mass, Nausea, Ovarian cyst, Pain, Staphylococcal infection, Swelling, Syncope, Tachycardia

Symptom Text: Information has been received from a physician's administrator, a registered nurse, a medical assistant and a consumer concerning her 17 year old daughter with seasonal allergies and allergy to BENADRYL and BACTRIM who on 14-MAR-2007 was vaccinated with a first 0.5 ml dose of GARDASIL (Lot No. 655618/0186U) administered in her left arm. On 09-JUL-2007 the patient received a second dose of GARDASIL (Lot No. 654272/0319U) administered in her right arm and on 09-JAN-2008 received a third dose of GARDASIL (Lot No. 657872/0515U) administered on her left arm. Concomitant medication included NUVARING. On 26-MAR-2008 the patient developed a "bump" on her thigh. In June 2008 the patient developed a MRSA infection, confirmed on 29-SEP-2008. On 02-JUL-2008 the patient experienced bowel movement issues. The patient's mother mentioned that the patient is in constant pain which she described as 6 on a scale of 1-10. She also had periodic paralysis of her lower extremities and her "muscles go numb and she falls all the time". She had abdominal pain and nausea and had developed ovarian cysts. The patient saw a pediatric surgeon for her ovarian cysts. The physician's administrator indicated that the condition had "nothing to do" with GARDASIL. The mother mentioned that the patient was almost completely bedbound. It was reported that the patient's boyfriend had a breakout of MRSA on 17-FEB-2009. The medical assistant stated that in March 2009 the patient was seen for the last time after a "well check-up". The patient was hospitalized twice in the summer of 2009 for an unknown reason (length of stay unspecified). The patient had been to the neurologist and had tests done on her muscles and her bones and no one could "figure out what's wrong with her". The medical assistant did not have any information surrounding the patient's paralysis, ovarian cysts, or hospitalizations. Bone scan, colonoscopy, CT scans and MRI tests were performed with no results provided. On 18-NOV-2009 the patient was seen by a neurologist. An EMG was done alo

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Arthritis, Psoriatic arthropathy, Steroid therapy, Wheelchair user

Symptom Text: Information has been received from a physician concerning her 12 year old daughter who on 05-MAR-2009 was vaccinated IM with the first 0.5 ml dose of GARDASIL (lot # unknown) and concomitantly received (DTaP) (manufacturer not reported). On 16-MAY-2009, the patient received the second dose of GARDASIL (lot # unknown) with no concomitant vaccinations administered at that time. On 19-SEP-2009, the patient received the third dose of GARDASIL (lot # unknown) with no concomitant vaccinations administered at that time. Three weeks after the patient's second dose of GARDASIL on approximately 06-JUN-2009, she developed chronic arthritis and was seen by an orthopedist (name of orthopedist not reported) for arthritis-type symptoms. The patient was placed on MOTRIN. The patient developed psoriatic arthritis and initially needed a wheelchair. The patient was seen by a rheumatologist affiliated with a hospital. The patient had an MRI and a bone scan and was diagnosed with psoriatic arthritis. The patient was placed on sulfasalazine and therapy with prednisone for six weeks. The patient was not hospitalized. Within 2 days after starting the medications the patient's symptoms had resolved. The patient was back to her normal activities. The rheumatologist was definitely related to GARDASIL and the physician thought her daughter's arthritis was related to receiving GARDASIL. Psoriatic arthritis was considered to be disabling by the physician. The Health Care professional contacted during telephone follow-up could not supply the following information: lot number. No further information is available at this time. Additional information has been requested.

MedDRA PT Abdominal pain, Abdominal tenderness, Acne, Activities of daily living impaired, Alopecia, Back pain, Decreased appetite, Depression, Diarrhoea, Dizziness exertional, Dyspnoea, Enteritis, Fatigue, Feeling abnormal, Heart rate increased, Hypertrichosis, Migraine, Nausea, Neck pain, Weight increased, Weight loss poor

Symptom Text: My entire life I have been very active, worked out every day of my life since 15, never ever in my life had any sort of acne...no health problems. About a year ago everything changed, in the past year I have gained exactly 27 pounds and although I continue and try to workout I am unable to lose this weight...I am so fatigued to the point I cant get out of bed most days which has affected a few semesters of college and I have lost a few jobs due to this fatigue which I cannot control. I am unable to bend over and pick anything up without getting dizzy and any activity as simple as running up the stairs my heart speeds up and I am out of breath and need to sit. I have consistently had a minimum of 2 migraines a week in which I am unable to leave the house this has been for the past year, and prior to these migraines I have extreme back and neck pain which painkillers cannot even help. I have been to numerous dermatologists trying to resolve 2 issues, adult acne AND excessive facial hair growth on my jawline, chin and under chin to the point Ii just use a razor now to remove the hair as I am unable to afford full laser hair removal and insurance does not cover. My entire life I have had beautiful thick hair, in fact so thick I would get stopped by people with compliments however the past year I pull chucks of hair out in the shower and it is very thin and brittle now. I have done so much blood work and every test in the book. In the past year I have been to a heart doctor, dermatologists, chiropractors, endocrinologist, natural homeopathic doctor, and 3 different physicians and NO ONE has a solution...my mom has been very down as she is upset for me and with me we feel so lost nobody has any idea what is going on. The past year I have consistently described myself as "this is not me and this is not my body". I now get depressed as I have no control of the weight gain or acne or facial hair or hair loss or any of this. My numerous doctor visits and mental pain I have endured have left a hole in my family's w

MedDRA PT Amino acid level normal, Drug exposure during pregnancy, Hydrocele, Laboratory test normal, Metabolic function test normal

Symptom Text: Information has been received via pediatric medical records from a physician concerning a newborn patient with passive smoke risk who's mother was vaccinated IM on 04-Dec-2008 with a 0.5ml first dose of GARDASIL while pregnant (WAES#0812USA1628). It was reported that on 13-JUL-2009, at the age of 3 days, the baby underwent an ultrasound test in order to investigate a scrotal mass. The ultrasound revealed moderate right sided hydrocele. The baby's testicles appeared to be normal with the right testicle measuring 1cm and the left testicle 9mm. Arterial flow was noted in both testicles. The epididmyides appear normal. On 13-JUL-2009 the following test results were obtained: blood lymphocyte count 25.0%, blood segmented neutrophil count 65.0%; blood band neutrophil count 4%, slight anisocyte observation, slight poikilocyte observation, slight polychromatic erythrocyte observation, slight macrocyte observation. Also performed on this day were congenital hypothyroidism, hemoglobinopathy, galactosemai, biotinidase deficiency, congenital adrenal hyperplasia, cystic fibrosis, amino acid profile, fatty acid profile and organic acid profile. All reported as normal. The baby was seen for multiple well visits where the genitalia was reported as normal. At the time of this event, the patient recovered from Hydrocele. No further information is available. All available medical records will be provided upon request.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician, for GARDASIL, a Pregnancy Registry product, concerning a female patient who was vaccinated with a dose of GARDASIL (no lot number provided). At "some point in the past" after receiving GARDASIL, the patient became pregnant and subsequently experienced miscarriage. At the time of reporting, the outcome was unknown. The patient sought unspecified medical attention. Upon internal review, miscarriage was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Caesarean section, Cardiac septal defect, Congenital anomaly, Cough, Diarrhoea, Drug exposure during pregnancy, Ear pain, Hyperbilirubinaemia, Irritability, Jaundice, Upper respiratory tract infection

Symptom Text: Information has been received from a respiratory therapist, pediatrician, nurse and office assistant via pediatric medical records concerning a newborn male patient with no known drug allergies who was born on 04-MAY-2009 by C-section (WAES# 0908USA03124). It was reported that on August 2008, the mother was vaccinated with a dose of GARDASIL (lot not reported) while pregnant. According to the reporter, the patient was born with "3 holes in his heart". It was unknown if the patient and her baby sought medical attention. The respiratory therapist stated that her baby was "doing OK right now". Nurse did confirm patient had a caesarian delivery on 04-MAY-2009 and he was a healthy male child. On 07-May-2009, a direct bilirubin test was performed with results of 0.23. Also on this day a blood urea nitrogen was performed with results of 7 and a total bilirubin was performed with results of 8.39. On 08-MAY-2009, a total bilirubin (7.73), direct bilirubin (0.19) and indirect bilirubin (7.54) were performed. There was no concomitant medication reported. It was reported that on 11-May-2009 that the baby experienced jaundice. According to the office assistant who pulled the baby's chart it was reported that at the office they had a report verbal only, noted in the chart from the pediatric cardiologist. It was reported that the baby was seen on 17-May-2009 and had a septal defect. The reporter stated that the cardiologist was going to "give it time to see if it was self-correcting, and scheduled a follow-up evaluation for the baby in six months". At that day the physician's office did not have any follow-up evaluation from the cardiologist. The office assistant provided cardiologist information. On 29-May-2009, the patient had a well child visit with no complaints. On 02-June-2009, the baby was seen for loose stools and fussiness. On 10-JUL-2009, the patient had his 2 month well child visit. On 31-JUL-2009 the baby was seen for upper respiratory infection and cough, which resolved on approximately 14-AUG-2009. On 21-AUG-2009

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Autoimmune thrombocytopenia, Blood product transfusion, Contusion, Cough, Diarrhoea, Dyspnoea, Epistaxis, Fatigue, Feeling hot, Haematochezia, Hypoaesthesia, Idiopathic thrombocytopenic purpura, Injection site pain, Lip disorder, Migraine, Monoplegia, Muscular weakness, Oral contraception, Paraesthesia, Petechiae, Respiratory tract congestion, Stomatitis

Symptom Text: I received one (1) shot of the HPV vaccine Gardasil on 09/25/09. Two months later, on 11/19/09, I went into my doctor with petechiae (red blood dots) on my legs, excessive bruising on my legs and arms, and mouth lumps (inside lower lip). I took a blood lab and when the results came in, I was at 8,000 platelet count and told to go to the ER right away. Treatment (steroids alone) lasted for 2 days, and had to go back to the ER, this time with arm numbness/temporary paralysis added to the issue. Treatment with a stronger medication (Anti-D) was administered, but again, two days later, I was back in the ER. A third treatment was administered (IVIG), and it lasted two weeks. Now I am scheduled to go back to the hospital for admission to do another dose of this. Aside from pain at the injection site for over a month, I have also now been diagnosed with the autoimmune disease thrombocytopenia (low blood platelets) which I have been dealing with for over a month at an aggressive level, and it shows no signs of getting better. During this condition, I have had arm numbness/temporary muscle paralysis, as well. 12/23/09 PCP medical records received. Service dates 11/19/09 to 12/21/09. Includes ED visit 11/21/09. Assessment: Idiopathic Thrombocytic Purpura. Patient c/o feeling warm, fatigue. Cough, congestion. Oral contraceptive use. Hematochezia. Paresthesia. Bruising on forearms. Presents at ED with petechiae. Multiple bruises thighs and feet. Bright red blood from nose. Tired. Diarrhea. Bumps in lower lip. Thrombocytopenia. 12/28/09 Discharge summary, hospital records received. Inpatient Service dates 12/8/09 to 12/11/09. Includes Labs from 11/23/09 to 12/22/09. Assessment: Thombocytopenia, Idiopathic Thrombocytopenic Purpura. Prior hospital admissions 11/19/09 to 11/23/09 for Thrombocytopenia / Idiopathic Thrombocytopenic Purpura. 12/2/09 to 12/3/09 for Thrombocytopenia, weakness, heaviness. Patient presented after follow up labs showed a platelet count of 20. (R) arm subjective weakness, headache, nose

Other Meds: Trivora Birth control (oral pill taken 1x per day) Albuterol inhaler (taken as needed for seasonal and pet allergies)

Lab Data: Thrombocytopenia. I have been now been admitted into the hospital 3 times, and have to go back again in a few days, as I have dropped again. My levels have been at 8,000, 3,000, and 12,000 (normal levels are 150,000 - 450,000) at the time

History: No. 12/28/09 Discharge summary, hospital records received. Service dates 11/23/09 to 12/22/09. Asthma. Allergies to erythromycin, penicillin.

MedDRA PT Caesarean section, Drug exposure during pregnancy

Symptom Text: Case of pregnancy follow-up received from a specialist through the Sanofi Pasteur MSD GARDASIL Pregnancy Registry on 11-MAR-2009. A 19 year old female patient with diabetes treated with insulin injection, received the first dose of GARDASIL (batch number not reported) on 15-FEB-2009 while she was pregnant. Her estimated date of last menstrual period was on 12-JAN-2009 and the estimated time of conception was 26-JAN-2009. At time of reporting the patient had no adverse effect. Echography performed on 03-MAR-2009, revealed a uterine sac of 25 mm with cardiac activity. The patient desired to go on with the vaccination. She had no previous pregnancy. There was no familial history of diabetes. Follow up information received by telephone on 14-DEC-2009: Case upgrade to serious upon the basis of the following information: The patient gave birth on 16-SEP-2009 a baby girl by cesarean delivery. The baby weighed 3.840 Kg and was in good health. There was no problem during the pregnancy. The patient was primipara and had no spontaneous abortion. Other business partner numbers included: E2009-02115. No further information is available.

MedDRA PT Arthralgia, Hypoaesthesia, Inflammation, Multiple sclerosis, Paraesthesia

Symptom Text: Information has been received from a health professional on 14-DEC-2009 concerning a 16 year old female patient with a history of migraine with aura who on 29-JAN-2009 was vaccinated intramuscularly with the first dose of GARDASIL (lot# 1400U, batch# NH38400) into the upper arm. Concomitant therapy included acetaminophen. On 05-Feb-2009 the patient experienced abdominal feeling of numbness (from TH9 to TH12) and both thighs, first just ventral, then also dorsal. The same day the patient was admitted to hospital. Neurological examination revealed a questionable pyramidal sign right, paraesthesia in both thighs (left > right) and left-sided paraesthesia of the body from TH 9 to TH 12. On 06-FEB-2009 MRI of cervical and thoracic spine showed no indication for inflammatory lesions. Cranial MRI showed suspicious lesions frontal right and in the left pons. VEP (visual evoked potentials) and SEP of tibial nerves (somatosensory evoked potentials) were normal. SEP of medial nerves showed reduced amplitudes on the left side and raised the question of an axonal lesion. CSF showed leucocytes 44/3 cells, protein 342 mg/l, albumin 195 mg/l, (albumin in the serum 39.3 g/l), IgG 43.1 mg/l, (IgG in the serum 9.5g/l), glucose 58 mg/dl, (glucose in the serum 98 mg/dl), lactate in CSF 1.24 mmol/l, oligoclonal bands in CSF detectable, intrathecal IgG-synthesis In Reiber-scheme IgG synthesis without barriers functional disorder. Normal values for: VZV (varicella zoster virus), HSV (herpes simplex virus), FSME (spring-summer encephalitis). Lab findings were normal for electrolytes, CK, transaminases, blood count, coagulation parameters, CRP, TSH, ANA<1:20, folic acid and vitamin B12 level were normal. Anti-HCV and anti-HIV were negative. The hospital physicians assumed a clinical isolated syndrome or a paravaccinal myelitis as adverse event after GARDASIL. The patient was treated with cortisone stosstherapy and subsequent oral tapering. Two days after discharge (12-FEB-2009) the symptoms resolved. During the further course the patien

MedDRA PT Blood test, Caesarean section, Cholecystectomy, Cholelithiasis, Drug exposure during pregnancy, Streptococcal identification test negative

Symptom Text: Information has been received from a registered nurse, for the Pregnancy Registry for GARDASIL, concerning a 27 year old female with PENICILLIN allergy and no other medical history who was intramuscularly vaccinated with the first and second 0.5 ml doses of GARDASIL on 14-July-2008 and 15-Sep-2008 (1st lot #660557/0072X) 2nd lot #659184/0843X), respectively. Concomitant therapy included diphtheria toxoid/tetanus toxoid which was vaccinated with the first dose of GARDASIL. Subsequently the patient became pregnant after receiving GARDASIL. The due date of pregnant gestation reported as 13-May-2009. No adverse effect reported. Laboratory diagnostic studies included prenatal blood tests. The patient sought unspecified medical attention. Follow up information was received from the registered nurse who reported that the patient had a history of irregular periods and she had reported that she was not pregnant at the time of her vaccination with GARDASIL in September 2008. The reporter administered the vaccine to the patient and estimated that the patient was approximately 5 weeks pregnant at the time of vaccination. On 30-Apr-2009 this patient delivered her baby by c-section following spontaneous rupture of membranes. Amniotic fluids were clear. Patient was GBS negative. Gestational age was 38 weeks +. It was also reported that the patient experienced cholelithiasis during pregnancy on 23-Mar-2009 and underwent a cholecystectomy on 27-May-2009. Upon internal review, c-section following spontaneous rupture of membranes was considered to be an other important medical event. The baby's experience has been captured WAES # 0901USA00343B1. Additional information has been requested.

MedDRA PT Bronchoscopy, Congenital myopathy, Hypotonia, Intensive care, Laryngomalacia, Mechanical ventilation, Pneumonia, Pneumonia aspiration, Respiratory disorder neonatal, Respiratory failure

Symptom Text: Information has been received from a registered nurse concerning a male baby whose mother was vaccinated with two doses of GARDASIL on 14-JUL-2008 and 15-SEP-2008 and was pregnant. On 30-APR-2009, the infant was born with problems. He had no respiratory effort at birth and required mechanical ventilation at a couple hours of life. The infant was admitted to a neonatal intensive care unit (NICU), then was transferred to another neonatal intensive care unit (NICU) and again transferred to another neonatal intensive care unit (NICU) for additional work-up on 05-MAY-2009, a pulmonologist performed a flexible bronchoscopy on the baby which showed mild laryngomalacia with normal vocal cord function. On 31-JUL-2009, the infant had suspected pneumonia, respiratory syncytial virus (RSV) was negative, influenza was negative. Respiratory cultures were positive for Ecoli. The infant alternated between being stable on room air and requiring respiratory assistant by bi-pap or nasal cannula through August 2009, remaining in the neonatal intensive care unit. In September 2009, the baby had suspected aspiration pneumonia with migrating infiltrates on chest x-ray. The baby was ultimately diagnosed with low respiratory muscle tone, respiratory failure and congenital myopathy. The baby had been referred to a children services at this time. The mother's experienced has been captured in WAES #0901USA00343. Additional information has been requested.

Other Meds: Unknown

Lab Data: bronchoscopy, 05/28/09, mild laryngomalacia with normal vocal cord function; diagnostic laboratory, 07/31/09, influenza was negative; chest X-ray, 09/??/09, migrating infiltrates; nasopharyngeal RSV, 07/31/09, negative; upper respiratory, 0

MedDRA PT Grand mal convulsion, Syncope

Symptom Text: Information has been received from a physician concerning a patient who on an unspecified date was vaccinated with the first dose of GARDASIL vaccine (lot#, route and site of administration not reported). Subsequently, the patient has a syncopal episode. At the time of this report, the patient's outcome was unknown. Follow up information has been received from a physician concerning a 16 year old female patient with no other relevant medical histories who on 09-DEC-2009, at 11:30, was vaccinated with the second dose of GARDASIL vaccine (lot#665547/1318Y) into the left arm, a second dose of VARIVAX vaccine (Oka/Merck) (lot# 665040/1086Y) into the right arm and a second dose of ADACEL (lot# UF460CA) into the right arm. On 09-DEC-2009 the patient developed syncope and a brief tonic clonic seizure that lasted 5-10 seconds. The patient was having her annual physical examination at time of vaccination. No medical attention was sought. There were no laboratory diagnostics studies performed. On 09-DEC-2009 the patient recovered. Upon internal review, tonic clonic seizure was considered to be an other important medical event. This is one of several reports from the same source. Additional information is not expected.

MedDRA PT Acne, Dizziness, Headache, Hypoaesthesia, Insomnia, Nausea, Neuropathy peripheral, Paraesthesia, Visual impairment, Vomiting

Symptom Text: I received the Guardasil shot series over the course of 6 months. After the first shot given in May, I was nauseous and vomited. I also developed severe facial acne that I'm still experiencing, two weeks after the first shot. I don't remember any problems after the second shot in August. Severe symptoms started on the evening the third shot was administered December 14, 2009. I had constant tingling in my right limbs (arm, all the way down to the tips of my fingers, and leg, from the knee down to the foot): the shot was given in my right arm. I was still able to walk and use my arm. It was not a sharp pain, just constant. By Thursday, Dec. 17 at 4 A.M., the tingling was prevalent in all my limbs and my feet felt numb. I went to the emergency room on Thursday, Dec. 17, 3 days after the shot as the tingling was worse and not subsiding. They ran a CT scan to rule out shunt problems since I have a VP shunt. All was fine with the shunt. On Friday Dec. 18, I went to another emergency room so I could be evaluated by a neurologist. He ran reflex tests and everything was working well. He diagnosed neuropathy and said he thought it would eventually subside. That night I experienced swimming vision for a few minutes and a headache. I had trouble sleeping each night, unable to get comfortable in bed; the tingling seemed to be worse when lying down. The next day I felt dizzy, had an intermittent headache, and experienced vision problems if there were bright lights. By Sunday, the symptoms became less severe and over the course of the next week, diminished completely. ```MR received 11/29/09, 11/30/09 and 12/28/09 for DOS 12/17/09 and 12/18/09. DX: Neuropathy. Pt c/o tingling in R side extremities for 3 days. Neuro exam wnl. Pt to follow up with neurologist. Pt discharged home. Pt was seen by a neurologist the next day and cleared of GBS. Impression: subjective numbness of L extremities and R U E. Pt seen on 12/28/09 and tingling had resolved.

Other Meds:

Lab Data: I had also received the H1N1 vaccination as well as the flu shot, about a month a before taking this final Guardasil shot. ```Lab and DX studies: Pain 6/10, CT wnl.

History: Codine, Hydrocephalus, VP Shunt ```PMH: hydrocephalus, ventriculoperitoneal shunt. Allergies: Codeine.

MedDRA PT Central nervous system inflammation, Multiple sclerosis

Symptom Text: Information was reported in a newspaper article via media monitors and CSL concerning a female patient (age was reported as a teenager to a woman in her early 20's) who could have been predisposed to multiple sclerosis (MS) or who had a prior history of symptoms was vaccinated with a dose of GARDASIL. Within three weeks of vaccination the patient experienced multiple sclerosis symptoms. The symptoms lasted from weeks to months. The patient had recovered. It was reported that GARDASIL may have triggered multiple sclerosis (MS) symptoms in some girls, who later recovered. A neurologist reported that five cases were reported in a journal article in January. Another five have since emerged. The neurologist stated GARDASIL was not the cause of MS; whether or not it was a trigger for episodes for inflammation in the brain in these rare cases is unclear. All cases were aged under 26. Symptoms began within three weeks of vaccination and lasted from weeks to months. The physician stressed that all those affected had recovered. Attempts are being made to obtain additional identifying information to distinguish the individual patients in the newspaper article. Additional information will be provided if available. No further information is available. The article also discussed the experience of other 9 patients while on therapy with GARDASIL (WAES 0912USA01664, WAES 0912USA02322, WAES 0912USA02324 and WAES 0912USA02325, WAES 0711AUS00143, WAES 0807AUS00041, WAES 0807AUS00274, WAES 0807AUS00280, WAES 0807AUS00277 and the auto-immune symptoms of a 14 year old on therapy with GARDASIL (WAES 0912USA02326).

MedDRA PT Chest discomfort, Chest pain, Dehydration, Dizziness, Echocardiogram, Malaise, Palpitations, Presyncope, Sinus congestion, Sinus tachycardia, Tachycardia, Viral infection

Symptom Text: Information has been received from a physician concerning a 24 year old female patient with no known drug allergies or pertinent medical history who on 12-DEC-2008 was vaccinated with the first dose of GARDASIL (Lot number 661764/0650X). Concomitant therapy included birth control pills. The patient developed SBT (Supra Ventricular Tachycardia) and she was hospitalized. The patient could not remember the exact date of her hospital confinement when she reported the event to the physician she thought it to be two weeks after the vaccination. The patient told her physician she underwent an electrocardiogram (EKG), echocardiogram (ECHO) and exam with no results provided to the reporting physician. No surgery was performed. On an unspecified date the patient was discharged from cardiologist's care. The patient will not receive further doses of GARDASIL as the patient believed the event was caused by the vaccine. The physician reported that there was no association between SVT and GARDASIL. At the time of the report the patient had recovered. "Supra Ventricular Tachycardia" was considered by the physician to be life-threatening. No further information is available. ```12/30/2009 ER records rec'd for DOS 1/5/2009 with dx: Presyncope. Chest pain. Pt presented to the ER after an episode of heart paplitations, tachycardia, dizziness and chest tightness. Pt in sinus tach at 143 which reduced to 102 after IVF bolus. Mildly dehydrated. Also c/o feeling unwell, and sinus-infection type sx. MD suspects sx r/t viral syndrome.

MedDRA PT Cold compress therapy, Dizziness, Dyskinesia, Eye rolling, Feeling abnormal, Hyperhidrosis, Hypotension, Loss of consciousness, Muscle twitching, Posture abnormal

Symptom Text: My daughter was told by a nurse to sit for 2-3 minutes after the injection of Gardasil. My daughter did this, slowly stood upright to make sure she felt alright after 3 minutes. She felt fine, stood by exam table for another 2 minutes and then we proceeded to check out at desk. We headed for the exit door of the pediatricians office, my daughter stopped walking, said she didn't feel right, felt very dizzy, her eyes rolled up into the back of her head several times, her head was wobbling (like she couldn't support it), her legs were like rubberbands and she started collapsing in my boyfriends arms. He layed her down on the office floor. My daughter was completely passed out, sweating, and her legs and arms were jerking and twitching like she was having a seizure!! I immediately got the nurse who administered the shot, and they took her blood pressure and said it was very low and I asked for cold compresses for her head. This all happened within 10-15 minutes after the vaccination of Gardasil!!

Other Meds: Microgestin FE Tabs 28

Lab Data:

History: No pre-existing medical conditions.

Prex Illness: No Illness at time of vaccination. Healthy teenage girl.

MedDRA PT Anal abscess, Chorioamnionitis, Drug exposure during pregnancy, Fungal infection, Funisitis, Infection, Labour complication, Vasculitis

Symptom Text: Information has been received from a nurse for the Pregnancy Registry for GARDASIL concerning a 21 year old female with no medical history or drug allergy who on 05-DEC-2008 was vaccinated with the second dose of GARDASIL (0947X). There was no concomitant medication. The patient's LMP was on 14-NOV-2008 and then the patient came into the clinic to receive the second dose of GARDASIL. Before the second dose of GARDASIL the patient was given a pregnancy test which came back negative and therefore the patient was given the second dose of GARDASIL. The patient came back into the clinic on 29-JAN 2009 and the patient found out she was pregnant. The nurse reported that the patient was approximately about a week to three weeks pregnant at the time she received the second dose of GARDASIL on 05-DEC-2008. No AE involved. The patient performed urine pregnancy test. The patient sought medical attention. Follow up information has been received from a registered nurse, concerning the patient with no illness at the time of vaccination or no pre-existing allergies or birth defects on 13-AUG-2008 received the first dose of GARDASIL and on 05-DEC-2008 AM received the second dose of GARDASIL IM on deltoid. The patient with 5 previous pregnancies had 1 full term delivery at 42 weeks from LMP, no pre-term delivery, 1 spontaneous abortions at 16 weeks from LMP, 3 elective terminations at unknown weeks from LMP and no fetal death. There was no birth defects in previous pregnancies. It was unknown if there any infant complications in previous pregnancies. Concomitant therapy included vitamins (unspecified). On 05-DEC-2008 the patient did a colposcopy pasts due for the second dose of GARDASIL. On 05-DEC-2008 pregnancy test was negative - specific gravity of urine was 1.025. The patient returned to office on 29-JAN-2009 and pregnancy test positive. On 23-MAR-2009 the patient did ultrasound for fetal structure scan and results indicated no abnormal findings. On 02-JUL-2009 the patient was treated with KEFLEX 500 mg 4 x/day for 7 days for

Other Meds: vitamins (unspecified)

Lab Data: colposcopy, 12/05/09; ultrasound, 03/23/09, fetal structure scan: no abnormal findings; urine beta-human, 01/29/09, pregnant; urine specific gravity, 12/15/09, 1.025; urine beta-human, 12/05/08, negative

MedDRA PT Drug exposure during pregnancy, Sepsis, Tachypnoea

Symptom Text: Information has been received from a registered nurse concerning a male patient whose mother on 13-AUG-2008 received the first dose of GARDASIL and on 05-DEC-2008 AM received the second dose of GARDASIL IM on deltoid. The patient was delivered on 15-AUG-2009, at 39 weeks from LMP. The patient weight 3628gm, length 51cm, Apgar score 8/9 and head circumference 33. Subsequently the baby developed tachypnea and presumed sepsis and was hospitalized. Course of IV antibiotics for 10 days. The baby was discharged on 25-AUG-2009. At the time of the report the outcome of the patient was unknown. No further information is available. The mother's experience has been captured in WAES0902USA02182.

MedDRA PT Epstein-Barr virus infection, Fatigue

Symptom Text: Information has been received from a physician concerning an 18 year old female patient with fatigue, depression and insomnia who was vaccinated with the first, second and third dose of GARDASIL on 06-AUG-2007, 06-NOV-2007 and 04-MAR-2008 respectively. Concomitant therapy included ZOLOFT, SEROQUEL and maybe CORTEF. The physician reported that after the third dose vaccination with GARDASIL, the patient experienced chronic fatigue and EPSTEIN-BARR syndrome. The physician also reported that about two weeks after the vaccination, on approximately 18-MAR-2008, the patient was diagnosed with EPSTEIN-BARR syndrome. Thyroid test(results not provided) and EPSTEIN BARR test were performed. The EPSTEIN-BARR test was positive. The patient sought medical attention in the office. It was reported that the patient was unable to attend her last semester of high school due to fatigue. At the time of the report the patient had not recovered. All telephone attempts to obtain follow-up information have been unsuccessful. The patient's chronic fatigue and EPSTEIN BARR syndrome were considered to be disabling by the physician. Additional information has been requested.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a 16 year old female consumer with no drug reactions/allergies and a history of asthma, for GARDASIL, a Pregnancy Registry product. It was reported that on 03-JUL-2009 the patient was vaccinated with the first dose of series of GARDASIL. There was no concomitant medication. The patient reported that at the end of July 2009 she found out she was pregnant. The consumer reported that on 04-Aug-2009 she had terminated the pregnancy and had recovered. The consumer reported that she had not received any additional doses of GARDASIL. No adverse event was involved. It was reported that therapy with GARDASIL was discontinued and that the patient recovered on an unspecified date while on therapy. Therapy with GARDASIL was not reintroduced. The patient sought unspecified medical attention. No laboratory diagnostics studies were performed. Upon internal review abortion induced was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Body temperature fluctuation, Fatigue, Pharyngeal erythema, Pyrexia

Symptom Text: Information has been received from a physician in a foreign country on 16-DEC-2009 concerning a 15 year old female who had received the first dose of GARDASIL in October 2009. The day following vaccination, the patient presented with very high fever and was hospitalised. Several blood and serological work-ups were performed, nothing was found. Fever lasted for more than three weeks. At the time of reporting the evolution was unknown. To be noted that this adopted patient with unknown family medical history often presented with very elevated bout of fever during childhood. Additional information received by telephone on 21-DEC-2009: The patient presented with bout of fever up to 40 degrees C during several days. Fever was irregular: down to 38 degrees C. resolved for one or two days, increasing again. The patient went on a visit to hospital twice before being admitted for a few days. Work-up was negative. Influenza was ruled out. Fever was final diagnosis. The day post vaccination the patient also presented with a red throat that lasted 8 days and fatigue that lasted one month. The patient received a corrective treatment with paracetamol and ORELOX for eight days for pharyngitis. At the time of reporting, the patient had recovered. Other business partner numbers include E2009-11691.

MedDRA PT Anxiety, Aura, Dizziness, Dyskinesia, Dyspnoea, Erythema, Facial palsy, Fatigue, Feeling abnormal, Feeling hot, Flushing, Heart rate increased, Hyperventilation, Hypoaesthesia, Hypokalaemia, Joint contracture, Loss of consciousness, Memory impairment, Muscle spasms, Musculoskeletal stiffness, Myalgia, Palpitations, Panic attack, Paraesthesia, Postictal state, Presyncope, Respiratory rate increased, Sinus bradycardia, Somnolence, Speech disorder, Staring, Tachypnoea, Tremor, Unresponsive to stimuli

Symptom Text: Information has been received from a physician concerning a 15 year old female patient, who on 22-JUN-2009 was vaccinated with the first 0.5 ml dose of GARDASIL, intramuscularly. Concomitant therapy included ALEVE and ALLEGRA. On 25-JUN-2009 the patient had a 5 minute period where she was unresponsive, her fingers were stiff and she was generally dazed. On 18-AUG-2009 the patient was given a second 0.5 ml dose of GARDASIL, intramuscularly. On 20-AUG-2009 she had a similar episode that lasted 15-20 minutes. On 06-SEP-2009, the patient had another episode that lasted 30-40 minutes. She was brought to an ER. The hospital staff told her that they thought that is was a panic attack and told her to take potassium supplements. The mother decided to not complete the series. At the time of reporting the patient had recovered. Follow up information has been received from a physician via medical records concerning the patient with penicillin allergy and smoker who on 22-JUN-2009 was vaccinated with the first dose of GARDASIL (Lot number 0702X) IM in the left deltoid and on 18-AUG-2009 with the second dose of GARDASIL (Lot number 0162Y) IM in the right deltoid. Concomitant therapies included albuterol and multivitamin. On 06-SEP-2009, the patient presented to the emergency room with chief complaint of possible anxiety, trouble breathing. The patient was sitting in church and began having trouble breathing. Patient began increased breathing. The patient began tingling of face and contracture of hands. The patient had trouble talking. The episode resolved after breathing slowed. At the ER, the patient felt hot. The patient had similar episode recently at school, 2 weeks ago stated by the mother and lasted 10 minutes. The patient's initial temperature was 99.4, pulse 115, respiration 28, blood pressure 142/105 and SaO2 100 and the discharge pulse rate was 62, respiration 16, blood pressure 124/84 and SaO2 was 100. Electrocardiogram was performed and showed sinus bradycardia with a heart rate of 58 bmp. The neurological/physiolo

MedDRA PT Drug exposure during pregnancy, Hydronephrosis, Surgery

Symptom Text: Information has been received from a consumer concerning her baby daughter who on 26-JUN-2008 was exposed via her mother who was intramuscularly vaccinated with her first dose of GARDASIL vaccine. Concomitant therapy included cephalexin. The consumer reported that, on 12-MAR-2009, she had her baby girl "but she had some problems"; the baby had hydronephrosis in her kidneys and had two surgeries. The baby was "doing fine now". The mother's experience has been captured in WAES 0807USA04523. Additional information has been requested. This report was previously sent to the PLA V501 on 25-NOV-2009 in WAES #0807USA04523.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Apnoea, Immediate post-injection reaction

Symptom Text: Information has been received from an agency concerning a female patient with no previous medical history reported who on 24-Sep-2009 was vaccinated with a second dose of GARDASIL (Lot # 0772X, Batch # NK15900). On the same day, immediately after vaccination, the patient lamented lack of breath. The outcome was not reported. The case is closed. Upon internal review, a corrective version was created on 29-DEC-2009. The case was reported as non serious by both HA and the reporter and upgraded to serious by company based on internal rules. Upon internal review apnea was considered to be an other important medical event. No further info is available. Other business partner included E2009-11483.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain, Dyspnoea, Throat irritation, Urticaria

Symptom Text: Initial case was reported as serious on 30-DEC-2009 by Health Authority (NO-NOMAADVRE-FHI-2009-8819/FHI09-2869). This case was also reported as part of a line listing after administration of GARDASIL during the period 15-NOV-2009 to 30-DEC-2009 (same HA ref). It was reported that an 11 year old girl was vaccinated with GARDASIL (second dose, batch number not reported, parental route, 1 DF) on 25-NOV-2009. HA coded abdominal pain, breathing difficult, itching (verbatim: itching throat) and urticaria (causalities possible) with onset on 25-NOV-2009, except for the breathing difficulty which lasted for 30 minutes. Tests performed on 25-NOV-2009: thrombocyte count 226 (no unit reported), eosinophil count 0 (no unit reported), hemoglobin 12.3 (no unit reported), blood pressure normal, pulse rate 90 (no unit reported), neutrophil count 3.2 (no unit reported), white blood cell count 6.5 (no unit reported) and oxygen saturation normal. Respiratory sound normal. The girl was treated with antihistamine (manufacturer unknown) (information not reported), PREDNISOLON (information not reported) and AIROMIR (information not reported) (no indications specified). GARDASIL, dose one, was given without any adverse events (no details on date etc. reported). The patient had previously experienced episodes of urticaria, unknown cause. The outcome is recovered. No further information is available. Case is closed. Other business partner numbers included: E2009-11928.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Dyskinesia, Familial risk factor, Loss of consciousness, Malaise, Muscle spasms, Muscular weakness, Myalgia, Nausea, Tetany, Vertigo

Symptom Text: Case received from a pharmacist in a foreign country on 30-DEC-2009: The reporter's daughter, a 16 year old female patient experienced tetany and spasmophilia after she had received the first dose of GARDASIL (batch number not reported) on 16-DEC-2009. She had no history of sleep disorder. Her father had a history of tetany and spasmophilia. The patient was practicing ski at the time of events but did not fall. Four days after vaccination she presented with vertigo, malaise, loss of consciousness, feeling like vomiting, muscle weakness, muscle pain and abnormal movement of the arms and legs. She could not stay on her feet. Each time she stood up, she experienced vertigo or lost consciousness. On 25-DEC-2009 she was hospitalized for three days. Tests found normal blood sugar, normal calcium and magnesium levels; EEG was normal. Inflammatory markers, CPK, bacterial and viral serologies were not tested. Diagnoses of tetany and spasmophilia were suggested in hospital. As the symptoms persisted, the paediatrician was called for further investigations. At the time of report the patient had not recovered. Other business partner numbers included: E2009-11935.

Other Meds: Unknown

Lab Data: Electroencephalography, normal; Blood glucose, normal; Plasma calcium, normal; Serum magnesium, normal

Symptom Text: About a week after the first shot I started to have Achilles pain which I had never had before. Several weeks later, I started having problems controlling my bladder. I had increased frequency and urgency. I had to start wearing diapers because I kept losing control. Muscle soreness also increased all over my body. My body was very stiff. I was a collegiate athlete and suddenly I felt like a prisoner trapped in my own body, unable to move. After each shot, my symptoms worsened. I became increasingly tired all of the time and only wanted to sleep during the day. My eyes were also extremely dry and I would get cuts all over my hands-signs of arthritis. ```MR received 1/14/10 for dates 3/11/08, 4/22/08. DX: overactive bladder syndrome, UTI. CC: pt states had UTI in 11/07, tx and resolved, then 2 months later had reoccurrence of sx but negative urine culture, and again in April 08. Currently, less burning sensation but pt c/o frequency/urgency, pressure, nocturia. Recently pt had inability to control leakage. OV 3/11/08: DX: food intolerance/malabsorption, asthma, rhinitis, steatorrhea. CC: pt c/o possible multiple food allergies causing abdominal pain, gas pain. Poss dust allergy w/ c/o wheezing.

Other Meds: Adderall 20mg

MedDRA PT Caesarean section, Drug exposure during pregnancy, Foetal disorder, Pulse absent

Symptom Text: Information has been received from a nurse for the Pregnancy Registry for GARDASIL concerning a 15 year old female who on 17-MAR-2009 was vaccinated with the first dose of GARDASIL 0.5ml IM (therapy site unknown) (Lot # 661760/0652X). The nurse reported that the patient received her first does of GARDASIL and then discovered she was pregnant. She sought medical attention. Urine test performed at the office on 04-MAY-2009 (results positive). No adverse effects reported. Follow-up information has been received from a physician concerning a 15 year old female who on 17-MAR-2009 was vaccinated with the first dose of GARDASIL 0.5ml IM (therapy site unknown) (Lot # 661766/06652X) and VARIVAX (MSD) (therapy dose, route and site unknown) (Lot#661558/1005X). The patient's last menstrual period (LMP) was on 01-MAR-2009 and the estimated delivery date is 06-DEC-2009. The patient had no previous pregnancies, spontaneous abortions, or fetal deaths (stillbirths). Follow-up information has been received from a physician. The patient's last menstrual period (LMP) was changed from 01-MAR-2009 to 20-FEB-2009 and the estimated delivery date was changed from 01-DEC-2009 to 27-NOV-2009. Follow-up information has been received from a physician concerning a 15 year old female with no significant concurrent conditions or medical history who on 17-MAR-2009 was vaccinated with the first dose of GARDASIL 0.5ml IM (therapy site unknown) (Lot # 661766/0652X) and VARIVAX (MSD) (therapy dose, route and site unknown) (Lot # 661558/1005X). On 09-JUN-2009 prenatal testing ultrasound was performed (results unknown). The patient's last menstrual period (LMP) was changed from 20-FEB-2009 to 01-FEB-2009 and the estimated delivery date was changed from 27-NOV-2009 to 06-DEC-2009. The physician noted the patient had no previous pregnancies. Follow-up information has been received from a physician concerning a 16 year old female student who on 17-MAR-2009 was vaccinated with the first dose of GARDASIL IM (therapy site unknown (Lot # 661766/0652X). On 16

MedDRA PT Grand mal convulsion, Headache, Injection site pain, Vaccine positive rechallenge

Symptom Text: Information has been received from a pharmacist concerning a 17 year old female who in July 2009 was vaccinated with the first dose and September 2009 was vaccinated with the second dose of GARDASIL, lot number(s) not available. In July 2009 the patient experienced headache and pain at injection site. In September 2009 the patient experienced headache and pain at injection site. On 27-DEC-2009 the patient experienced a GRAND mal seizure (reported as since December 27 has had four Grand mal seizures). On approximately 27-DEC-2009 the patient experienced Grand mal seizure. On approximately 28-DEC-2009 the patient experienced Grand mal seizure. On approximately 29-DEC-2009 the patient experienced a Grand mal seizure. The pharmacist reported that the patient had no history and a clean CAT scan (no other details provided) and that she was looking at all possibilities. Upon internal review, Grand mal seizure was considered to be an other important medical event. No further information is available.

MedDRA PT Cleft palate, Drug exposure during pregnancy

Symptom Text: Initial case was reported on 19-AUG-2009 by consumer to company representative. Further information was received from a nurse on 20-AUG-2009. It was reported that a baby was born on 03-APR-2009 through a normal and uncomplicated birth. He weighted 3440g and was 49cm tall. The boy was born with cleft palate and will undergo some surgery for event in the near future. His mother was vaccinated with GARDASIL, dose 1 (batch number NE43150, lot # 654883/0870F) on 12-SEP-2007, dose 2 (batch number NF27900, lot# 1537F) on 15-NOV-2007 and dose 3 (batch number NG22850, lot# 0510U) on 12-MAR-2008. A few months later she got pregnant. During the pregnancy she developed a facial paresis. Cleft palate was considered to be a congenital anomaly. The mother's experience has been captured in WAES# 0908USA03588. No further information is available. Case is closed. Other business partner numbers include E2009-08171.

MedDRA PT Abdominal distension, Ovarian cancer, Ovarian cyst, Surgery

Symptom Text: Information has been received from a general practitioner concerning a 17 year old female patient with no family history of ovarian cancer who on 15-NOV-2008 and on 06-FEB-2009 was vaccinated with the first and second doses of GARDASIL (batch number, lot number not provided). The patient was not on contraceptives at time of reporting. On an unspecified date, the patient experienced significant abdominal distension. MRI was very suggestive of a malignant lesion. Ovarian cancer was consequently suspected. The patient underwent surgical operation in December 2009: genital organs were preserved and the surgeon specified that it was probably a non-malignant cyst. Anatomopathological results were awaited. The outcome was not reported at the time of reporting. The patient's ovarian cancer, abdominal distension, and ovarian cyst were considered other important medical events. Other business partner number included: E200911947. Additional information has been requested.

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Arthralgia, Arthropathy, Headache, Hypoaesthesia, Myalgia

Symptom Text: Information has been received from a physician concerning a female patient with no pertinent medical history and no known allergies who on an unknown date was vaccinated with a second dose of GARDASIL (Lot # not reported). Concomitant therapy included isoniazid, 2 months prior to getting first dose of GARDASIL, had been on isoniazid for 4 months total. A few days after receiving the second dose of GARDASIL, the patient experienced diffused muscle pain, arthralgia, knees hurt, difficulty with joints and had headaches. The physician believed significant disability because the patient "could not function anymore and not getting out of the house". The physician also mentioned that the patient did not have any problems after the first dose of GARDASIL. The patient sought medical attention by an office visit. A "blood work" test was performed which was normal. At the time of the report, the outcome of the patient was not recovered. The health care professional contacted during telephone follow-up could not supply the following information: dates of vaccination, lot numbers and date of event. No further information is available. ```MR received 01/20/10 and 01/22/10 for DOS 01/04/10. DX: Pt presented to ED with hand numbness, HA, pain in both wrists, arthalgias, myalgias, arthropathy. Tx: Aleve.

Other Meds: Isoniazid

Lab Data: Hematology, "blood work" was normal ```DX studies: CXR: negative, Rheumatoid factor: negative.

History: ```PMH: Allergies: none.

MedDRA PT Dizziness, Headache

Symptom Text: Information has been received from a physician and a nurse concerning a 15 year old female patient with unspecified psychological trauma, with a medical history of positive varicella and low vitamin D and with no known drug allergies, who on 10-SEP-2009, was vaccinated with the first dose of GARDASIL (663451/0216Y). Concomitant vaccine therapies included : RECOMBIVAX HB (manufacturer unknown) (Lot No: 664738/0650Y) and Td (Lot No: A023B). No problems were noted after vaccination. On 05-JAN-2010, the patient was vaccinated with the second dose of GARDASIL (Lot No: 665547/1318Y). Concomitant vaccine therapies included influenza virus A (antigen type unspecified) vaccine (H1N1) (Lot No: UP057AA) and influenza virus vaccine (unspecified) (Lot No : U3366AA). The physician reported that after the patient received her second dose of GARDASIL, on 05-JAN-2010, she curled into the "fetal position" and stated that she could not get up". She was also experiencing dizziness and a headache. The physician also reported that after 2 hours, the patient still could not get up so she was taken to the ER by an ambulance. On the same day, 05-JAN-2010, blood pressure and pulse were taken (no results were reported). No treatment was given in the office. The nurse reported that she did not see any "patient's fetal position curling" and she stated that the patient may had been dramatizing for the physician. In the ER, the patient was observed for four hours and no treatment was required. The patient was not admitted. The nurse also reported that on 07-JAN-2010, she spoke to the patient's mother and stated that her daughter recovered except for a minor headache. The patient sought medical attention and was seen by the physician at a hospital. The physician considered "Curled into the fetal position and could not get up", dizziness and headache as other important medical events since the patient was rushed to the hospital in an ambulance. No further information is available.

MedDRA PT Back pain, Body temperature normal, Cough, Diarrhoea, General physical health deterioration, Headache, Hypokinesia, Influenza like illness, Meningism, Muscular weakness, Musculoskeletal stiffness, Pain in extremity, Pharyngeal erythema, Rhinitis

Symptom Text: Case received from the Health Authority on 07-JAN-2010. It was reported by a pediatrician that a 17-year-old patient was vaccinated with a dose of GARDASIL (manufacturer unknown, lot no. not reported). I.M into the right arm and concomitantly with a booster dose of diphtheria toxoid and pertussis acellular vaccine and poliovirus vaccine inactivated and tetanus toxoid (manufacturer unknown, lot-no. not reported) I.M. into the left arm on 11-Aug-2009 in the afternoon. In the evening post vaccination the patient began to developed increasing pain and weakness in both arms, especially at the right site and in the night post vaccination she experienced severe back pain. The next day in the morning she additionally experienced headache and impaired movement of both arms and upper body. She was hospitalized on 12-AUG-2009. Physical examination revealed subfebrile temperature, a reduced general condition, a reddened throat, mild neck stiffness and inability to do the "knee kiss". The ophthamological examination was without pathological findings. The patient was treated with PERFALGAN, DORMICUM and ibuprofen infusions. Different diagnoses of a vaccination reaction or viral infection were assumed by the hospital physicians. The paediatrician stated the symptoms as meningeal irritation with positive meningitis signs. On 13-AUG-2009 the symptoms improved and on 14-AUG-2009 the girl had completely recovered and was discharged. The patient had been in a foreign country from 01-AUG-2009 to 08-AUG-2009. Within that time she experienced flu-like symptoms with cough, rhinitis, diarrhoea and pain in limbs for just one day. File is closed. No further information is available.

Other Meds: Unknown

Lab Data: Laboratory results were pathological for CRP (6.0 mg/L), hemoglobin (7.8 g/dl), leukocytes (13.0/nl) and MCHC (22.3 g/dl). No normal values were reported. IgG, IgA, IgM and labumin were without pathological findings (no values reported). CS

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Amnesia, Fall, Head injury, Loss of consciousness

Symptom Text: It was reported by a healthcare professional via foreign company representative on 18-NOV-2009. This case in linked with non-serious case (corrected on 13-JAN-2010) E2009-10746. (same reporter, different product, corrected on 13-JAN-2010), that a female patient had received a first dose of GARDASIL (batch number not reported) on an unspecified date. Three days after vaccination, the patient fell off her bicycle and lost consciousness. She could not remember anything and was not able to say whether she had fallen accidentally or had a malaise. Neurological test were performed but the result were not reported. The reporting investigator physician believes there was no connection between the event and the vaccination. Follow up information received from the Health Authorities on 07-JAN-2010: Case upgraded to serious according to the Foreign Health Authorities. The patient was 14 years old. She had received the first dose of GARDASIL on 27-OCT-2009, i,e 3 days after vaccination, she experienced loss of consciousness and cranial trauma as she fell from her bike. However, the patient presented with a full amnesia of the event and consequently could not tell whether she first fell from her bike and experienced loss of consciousness and cranial trauma, or if she lost consciousness as she was riding her bicycle and then experienced a cranial trauma. There was no witness of this event. Malaise was no longer mentioned. Cardiological and neurological examinations were normal. At the time of reporting, the outcome was not provided. To be noted that the linked cases was non-serious and concerned a different product, as corrected in the introductory sentence. Other business partner's numbers included: E2009-10741. No further information is available.

Seriousness: ER VISIT, HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Drug exposure during pregnancy, Induced labour, Pre-eclampsia

Symptom Text: Information has been received from a physician concerning a 17 year old female patient with no pertinent medical history and no known allergies who on 12-NOV-2009 was vaccinated with a 0.5ml IM dose of GARDASIL (Lot# 663453/0249Y) and a meningitis vaccine (manufacturer unspecified) while pregnant (third trimester). There was no concomitant medication. On 12-NOV-2009 an ultrasound test was performed which showed the patient was 31 weeks of gestation. Her due date was 13-DEC-2009. Subsequently the patient experienced preeclampsia and was admitted in the hospital. Labor was induced and the child was healthy. At the time of the report the patient had recovered. The reporting physician considered preeclampsia to be immediately life-threatening. A lot check has been initiated. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Blood test, Condition aggravated, Convulsion, Grand mal convulsion, Hyperhidrosis, Hypotonia, Loss of consciousness, Neurological examination normal, Pallor, Syncope

Symptom Text: Information has been received from an advanced registered nurse practitioner concerning an 18 year old female patient with history of fainted in the past after seeing needles who on 11-JAN-2010 was vaccinated with a first 0.5 ml dose of GARDASIL. The nurse practitioner reported that "as she was withdrawing the needle from the patient's arm, she went limp and went back on exam table, then seized loss of consciousness, came to conscious and reported seizure activity. She left in ambulance to a hospital (stayed in hospital was unknown) and she was stable. Neurological evaluation was negative. Follow up information has been received from an advanced registered nurse practitioner concerning the patient on 11-JAN-2009 was vaccinated with the first dose of GARDASIL (Lot # 661954/1131X), 0.5 ml, IM. The patient did not received any concomitant vaccinations at that time. When the registered nurse withdrew the GARDASIL needle from the patient. the patient became limp and had a tonic- clonic seizure with loss of consciousness that lasted about 60 seconds. The patient regained consciousness and had another tonic- clonic seizure with loss of consciousness that lasted about 40 seconds. The patient regained consciousness and was pale and diaphoretic. Oxygen was administered and the patient's blood pressure was 80/40. The paramedics were called to the office and the patient was transported to the Emergency Room (ER) at a hospital. At the time the patient refused intravenous (IV) therapy. Blood laboratory tests were drawn in the ER and the patient fainted. The patient regained consciousness and recovered. The patient was not admitted to the hospital; she was kept in the hospital for one hour and was sent home. On 12-JAN-2010 during a conversation with the registered nurse the patient reported that she had recovered. The patient had a scheduled appointment to see the advanced registered nurse practitioner on 14-JAN-2009 for routine physical. Upon internal review tonic-clonic seizure was considered an other important medical event.

MedDRA PT Abdominal pain upper, Crohns disease, Diarrhoea, Haematochezia, Reaction to previous exposure to any vaccine

Symptom Text: Information has been received from a physician concerning adolescent female patient aged 15 or 16 year old who on 30-APR-2008 was vaccinated with the third dose of GARDASIL (batch number NH06740, lot number 1147U). In August 2008, i.e. four months after vaccination, the patient developed stomach ache. In September 2008, she also presented with repeated diarrhoeas. The patient was hospitalized. Blood was found in her stools. Different examinations were performed (no further specification). The diagnosis of Crohn's disease was established. The patient was treated with PENTASA and corticosteroids. To be noted that after receiving the first dose of GARDASIL, she had experienced in December 2007 malaise, vertigo, nausea, lose of consciousness, cephalgia and hypotension at 10/6. She had been hospitalized. vagal malaise had been diagnosed. She had recovered on an unspecified date. Case linked with serious case E2010-00198 (same reporter, same patient, same product, but different dose and different reaction). The patient had received second dose of GARDASIL in December 2007 and had developed stomach ache which had been treated with SPASFON. At the time of reporting, the patient was doing better but pain still persisted.

Symptom Text: Information has been received from a neurologist concerning a 15 year old female patient who on 16-APR-2009 and on 16-JUN-2009 was vaccinated with the first dose (lot# 1477U, batch# NH25390) and second dose (lot# 1400U, batch# NH38400) of GARDASIL which were well tolerated. On 03-NOV-2009, the patient was vaccinated with the third dose of GARDASIL (lot# 1695U, batch# NH25730) (injection route and site not reported). About three weeks post vaccination, the patient underwent a laparoscopic appendectomy. One week later, that is about four weeks post vaccination, the patient developed hemiplegia and urine retention. Initially suspicion of GUILLAIN-BARRE syndrome was raised. The patient was hospitalized in a neurological department for clarification. Several examinations were carried out including MRI which showed active inflammatory lesions in spinal cord and brain. All virological serologies (not otherwise specified) showed negative results. Lumbar puncture showed increased cells at the beginning of hospitalization, afterwards results normalized. Diagnosis of encephalomyelitis was established. The patient was discharged on 13-JAN-2010 in a good general condition but with slight signs of hemiplegia in both hips. The hospital report was requested. Other business partner number included: E2010-00173. Additional information has been requested.

MedDRA PT Headache, Loss of consciousness, Vision blurred

Symptom Text: This case was reported by a pharmacist (subject's mother) and described the occurrence of loss of consciousness in a 11-year-old female subject who was vaccinated with TWINRIX (GlaxoSmithKline), (non-gsk) GARDASIL. On an unspecified date the subject received 2nd dose of TWINRIX (unknown), 2nd dose of GARDASIL. At an unspecified time after vaccination with GARDASIL and TWINRIX, the subject experienced loss of consciousness, blurred vision and headache. This case was assessed as medically serious by GSK. At the time of reporting the headache was unresolved. No further information was expected, therefore this case has been closed.

MedDRA PT Abdominal pain upper, Acute stress disorder, Conversion disorder, Crying, Dizziness, Dyskinesia, Fall, Hypoaesthesia, Loss of consciousness, Malaise, Migraine, Mydriasis, Panic disorder, Restlessness, Syncope, Tremor

Symptom Text: Three weeks after Taylor's first Gardasil shot Taylor started having tremors and shaking in her legs. On 9/11 the school called. she was shaking violently all over and was crying because she couldn't stop. We took her to the doctor who checked for low blood pressure, low blood sugar and a few other tests. After the second and third shots she got worse. She started getting dizzy and many times fainting and having seizures. She even started wandering with pupils fully dialated and wasn't "there". Her legs would often go numb and she has had many migraine headaches that would last as long as a week. Also stomach pains and sickness. Her seizures have lasted up to 45 minutes and she is unconsious the entire time. She has had at least 90 episodes! ```1/25/10 Received PCP, Psych & multiple Neuro consults (last 6/10) medical records FINAL DX: non-epileptic seizure-like activity; pseudoseizures; acute stress disorder; conversion disorder; panic disorder w/o agoraphobia; migraine HAs. ```1/25/10 Received hospital medical records for 5/12-13/09. Records reveal patient experienced episodes of dizziness, falls w/jerking movements since beginning 9/2007. Not epileptic, possibly anxiety related. Tx w/meds & counseling which started 10/08. Initially improved then recurred & increased in frequency. Sent by psychiatrist for repeat 24-hour video EEG on 5/12/09.

Other Meds:

Lab Data: Taylor has had multiple tests. EEG's EKG's, full blood work, MRI's, and a Video EEG. CAT scan. All came back normal. Dupont Hospital, Fort Wayne Fort Wayne Neurological Center Lutheran Hospital Fort Wayne Fort Wayne Pediatrics ```1/25/

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Activities of daily living impaired, Anxiety, Convulsion, Headache, Impaired work ability

Symptom Text: My granddaughter had the 3 shot series of GARDASIL approximately 2-3 yrs ago. She was a perfectly healthy normal teenager. Then you had the GARDASIL. Since then she continues to suffer from debilitating headaches and has seizures - she had been seen by a neurologist and there tests show no signs of Epilepsy, just some sort of "seizure disorder". This has made a drastic change in her lifestyle. She no longer goes out with her friends for fear of having a seizure, finds it impossible to hold a job because of these problems, and lives with constant anxiety over what will happen next. Also, she has a younger sister who had two of the shots and ever since has had problems with dizziness and blacking out. These were both perfectly healthy young girls before these shots.

Other Meds:

Lab Data: Patient has been in and out of the hospital for the last couple of years since having the GARDASIL shots. I would have to contact her doctor or hospital for exact dates.

History: The only pre-existing medical condition was Asthma, she has had no pregnancies, does not smoke or use alcohol or illegal drugs.

MedDRA PT Antibody test, Blindness, Borrelia burgdorferi serology, Chest X-ray, Chorioretinal scar, Choroiditis, Differential white blood cell count, Full blood count, Fundoscopy abnormal, Inflammation, Retinal pigment epitheliopathy, Syphilis test, Tuberculin test, Visual acuity reduced

Symptom Text: It was reported in a published article, title as stated above that a 17 year old female who was vaccinated with GARDASIL. The patient was referred for new onset vision loss in both eyes 3 weeks after being vaccine. A standard dose of 0.5 ml was injected intramuscularly into the left deltoid without any resulting skin reaction. Her medical history was significant for depression treated with quetiapine. Three weeks following vaccination, she developed painless vision loss in the left eye followed 2 days later with painless vision loss of the right eye. The patient denied any viral prodrome. On examination, visual acuity measured 20/60 in the right eye and 20/100 in the left eye. Intraocular pressure measured 14 mm Hg in both eyes, and there was no conjunctival injection, no anterior chamber cells and no anterior vitreous inflammation on dilated fundus exam she was found to have multiple creamy chorioretinal infiltrates in the macula extending into the id-periphery, left eye greater than right. On fluorescein angiography, the lesions demonstrated early hypofluorescence and late hyperfluorescence. Systemic evaluation was within normal limits and included a complete blood count with differential, tuberculin skin test, chest radiograph, lyme titres, rapid plasma regain and fluorescent treponemal antibody. There was no family history of autoimmune disease. The patient was diagnosed as having acute posterior multifocal placoid pigment epitheliopathy (APMPPE) and observed. After 5 days, the patient's vision deteriorated to 20/400 in the right eye and count fingers at six feet in the left eye, and fundus exam demonstrated chorioretinal scarring in the macula with persistent activity of the lesion margins. At this time, because of the scarring, the diagnosis shifted to ampiginous choroiditis, and oral prednisone 1 mg/kg/day was initiated. The prednisone was successfully tapered off within 3 months without recurrence of the choroiditis, but extensive macular scarring remained. The final visual acuity was 20/50 in the right e

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Intra-uterine death

Symptom Text: Information has been received from a registered nurse, for GARDASIL, a Pregnancy Registry product, concerning her daughter, a 24 year old female with a history of ectopic pregnancy one year ago who approximately on 13-NOV-2008 was vaccinated with the first 0.5ml dose of GARDASIL intramuscularly. On 13-MAY-2009, the patient was vaccinated with the third 0.5ml dose of GARDASIL while pregnant. There were no concomitant medication, drug reactions and allergies. The home pregnancy test resulted positive on 14-MAY-2009. The patient's LMP was not reported. The patient had sought unspecified medical attention. Follow-up information has been received from the registered nurse, concerning her daughter, a female patient who smoked but stopped smoking at 6 weeks gestation. It was reported that the date of last menstrual period was 02-APR-2009 and the estimated delivery date was 07-JAN-2010. On 17-MAY-2009, pelvic and abdominal ultrasound was performed. On 17-JUN-2009, pelvic and abdominal ultrasound was performed which showed fetal death. Subsequently, the patient experienced a spontaneous abortion. Upon internal review, spontaneous abortion was determined to be an other important medical event. Additional information has been requested.

Other Meds: None

MedDRA PT Amnesia, No reaction on previous exposure to drug, Petit mal epilepsy, Syncope, Tonic clonic movements

Symptom Text: Initial information received on 14-JAN-2010 from a company representative. Some information was confirmed afterwards by a physician. Case concerns physician's daughter, a 14 year old female patient who on 13-JAN-2010 was vaccinated with the third dose of GARDASIL (lot number and batch number not reported), site and route of administration not reported. Initial information was given by the company representative on 14-JAN-2010, according him, 15 minutes after vaccine administration the patient suffered syncope, which lasted for one minute, and presented tonic-clonic movements in the right leg. 15-JAN-2010 the health care professional was contacted. According to the physician the event lasted for 1 minute approximately, the patient suffered something like an absence seizure, after the event the patient could not remember what had happened. The patient recovered completely on the same day of vaccine administration (13-JAN-2010). The health care professional considered this adverse event as non-serious. This case was assessed as serious by agency as other medical event (Absence seizure). The patient received the first and second dose of GARDASIL without adverse events (dates, manufacturer, batch number, route and site of administration not reported). Other business partner numbers include E2010-00251. Case is closed. No further information has been given.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Encephalomyelitis, No reaction on previous exposure to drug, Paraesthesia, Paraesthesia oral, Paresis

Symptom Text: Information has been received from a Health authority under local reference number GR20090627 and GR0901454 on 14-JAN-2010. A 27 year old female patient, had received a dose of GARDASIL (batch number and site not reported) via intramuscular route on 13-OCT-2009. On 16-OCT-2009, the patient experienced paresis, facial paraesthesia and circumoral paraesthesia. The patient had a concomitant therapy with estrogen-progestogen contraceptive. The patient was hospitalized for paresis of the left superior limb, with sensation of paralysis of the face (on the left side) and facial paraesthesia appeared 48 hours after the vaccination with GARDASIL vaccine (third injection on 13-OCT-2009). The two previous injections (on 01-APR-2009 and 08-JUN-2009) induced no reaction. To be noted that the patient took POPPER 15 days before (data collected via the family doctor of the patient). An encephalomyelitis was then suspected. The infectious serology (viral, bacterial and parasitic) returned negative for the serum and the CSF. The cytology examination of the CSF didn't highlighted malignant cells. The electrophoresis of the CSF proteins recovered a normal repartition. The rest of the biological examination had no particularity (normal autoimmune workup). On 04-NOV-2009 the symptoms had well regressed. In conclusion, the accountability of GARDASIL was taken in account, without ruling out the responsibility of the POPPER. At the time of reporting, the patient was recovering. The outcome was not reported. The health authorities assessed the causal relationship between the reported reactions and vaccination with GARDASIL vaccine as "doubtful" (C2 S1 I1) according to the foreign method of assessment. Other business partner's numbers included: E2010-00226.

Other Meds: hormonal contraceptives (unspecified)

Lab Data: Diagnostic pathological examination, cytology didn't highlighted malignant cells; CSF protein electrophoresis, normal repartition; clinical serology test, negative (viral, bacterial, parasitic)

History: Encephalomyelitis

MedDRA PT Convulsion

Symptom Text: Information has been received from an office manager in a physician's office concerning an 11 year old male who on an unspecified date was vaccinated with a dose of GARDASIL (dose, route and lot number not reported). Concomitant therapy given on the same date included influenza virus A (antigen type unspecified) vaccine (H1N1) (manufacturer unknown), FLUMIST intranasal and TB skin test. Subsequently the patient experienced a seizure. It was reported that the seizure improved with therapy and on an unspecified date the patient recovered. On 24-FEB-2010, follow up information was received from a medical assistant. The patient's name and date of birth were reported. On 27-Jan-2010, the patient was vaccinated with the first dose of GARDASIL (lot number 662765/1353Y). The patient also received concomitant influenza virus A (antigen type unspecified) vaccine (H1N1) (lot number not reported), FLUMIST intranasal (lot number not reported) and TB skin test (Manufacturer and lot number were unknown). After the patient received the vaccinations, he had a seizure that lasted a few seconds. The patient's blood pressure was 92/60. An ambulance took the patient to an emergency room. The medical assistant stated that the patient was kept in hospital for observation. On an unspecified date, the patient had recovered. The medical assistant stated that it was unknown if the patient's seizure was life-threatening. Additional information has been requested.

MedDRA PT Delivery, Drug exposure during pregnancy, Premature labour, Urine human chorionic gonadotropin positive

Symptom Text: Information has been received for the Merck Pregnancy Registry for GARDASIL vaccine from a Nurse Practitioner concerning a 15 year old female with allergy to CECLOR who on 11-AUG-2008 was vaccinated with first dose of GARDASIL vaccine (Lot # not provided), 0.5ml. intramuscularly in deltoid. Concomitant therapy included hormonal contraceptives (unspecified). On 12-DEC-2008 she received second dose of GARDASIL vaccine (Lot # 659962/1740U) 0.5ml, intramuscularly in deltoid and she was pregnant. Her last menstrual period was 16-NOV-2008 and her estimated due date is 22-AUG-2009 and the day of conception was believed to be on 29-NOV-2008. There were laboratory Diagnostic Studies performed: urine pregnancy test positive. The patient sought medical attention in the office. Additional information has been received from Advance Practice Nurse (also reported as Family Nurse Practitioner) who reported that the patient received first dose of GARDASIL vaccine (Lot # not provided), 0.5ml, intramuscularly in left deltoid on 05-AUG-2008. Concomitant therapy included hormonal contraceptives (unspecified) and vitamins (unspecified). Follow up information has been received from the nurse practitioner who indicated that the patient delivered a 2 lb baby boy on 26-MAY-2009 (WAES# 0812USA03338B1). Upon internal review, premature labor was considered an other important medical event. Additional information has been requested.

Other Meds: Hormonal contraceptives; Vitamins (unspecified)

MedDRA PT Abdominal pain, Abdominal rigidity, Aphthous stomatitis, Asthenia, Candidiasis, Clostridium difficile colitis, Dark circles under eyes, Dehydration, Diarrhoea haemorrhagic, Dizziness, Dyspnoea, Enterocolitis, Enterocolitis haemorrhagic, Fibrosis, Gastrointestinal tube insertion, General physical health deterioration, Haematochezia, Headache, Lung disorder, Lung infiltration, Mucosal dryness, Oral candidiasis, Pallor, Pneumonia, Pyrexia, Regurgitation, Skin turgor decreased, Stomatitis, Tongue coated, Upper respiratory tract infection, Vasculitis, Visual impairment, Vomiting, Wegeners granulomatosis

Symptom Text: Information has been received from a Health Authority (reference no. PEI2009027719) concerning an adipose 14 year old female patient who on 30-SEP-2008 was vaccinated IM with the first dose of GARDASIL (batch number NH35150, lot number 1285U) into the left deltoid muscle. On 10-OCT-2008, the patient developed bloody diarrhoea for four times per hour during the day and twice an hour per night. The family physician recommended oral rehydration. The oral electrolyte solution was regorged, the patient vomited repeatedly and developed asthenia and dizziness. She was hospitalized on 21-OCT-2008. At time of admission the patient showed a reduced general condition and exsiccosis, decreased skin turgor, dry mucosa, pallor, dark circles under the eyes, abdominal pain and guarding and coated tongue. Lab findings see lab comments. Stool examination revealed Clostridium difficile toxine. Diagnosis of hemorrhagic enteritis, enterocolitis due to clostridium diff. was established and confirmed by abdominal sonography on 22-OCT-2008 and coloscopy on 28-OCT-2008 (distinctive colitis with ulcers by the evidence of Clostridium difficile). Histology showed ulcerous colitis possible evoked by a severe infectious pathogenesis. Colitis ulcerosa was ruled out. Therapy with solutions for parenteral nutrition was started. Additional treatment included METRONIDAZOLE and VANCOMYCIN for clostridium difficile. Oral nutrition was changed to feeding tube and administration of NUTRISON. In the course the patient developed oral and perianal aphthae which was treated with DYNEXAN and oral candidiasis, treated with ANTIMYCOTIC ointment. Both events improved within the course. Despite antibiotic therapy symptoms did not improve. An autoimmune disease was assumed (increased c-ANCA values) and therapy with PREDISOLONE and SOLOFALK was started on 05-NOV-2008. Hereunder diarrhoea and general condition improved quickly. Oral food and fluid intake was possible again. As bloody stools persisted 12-NOV-2008 PREDNISOLONE was reduced. The patient was discharge

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Menstruation irregular

Symptom Text: Information has been received from a nurse practitioner for the pregnancy Registry for GARDASIL concerning a 14 year old female patient with hypertension who on 13-OCT-2008 was vaccinated with her first dose of GARDASIL (Lot#660612/0229X) by intramuscular route and a dose of VARIVAX (lot and route not reported). Concomitant therapy included influenza virus vaccine (unspecified) and DTaP (unspecified). On 09-DEC-2008 the patient received her second dose of GARDASIL (Lot# 660612/0229X). As of 15-DEC-2008, the patient was eight weeks pregnant (LMP 20-OCT-2008, EDD 27-JUL-2009). The patient reported no symptoms. Follow up information has been received for a health care professional who clarified the patient's EDD of 27-JUL-2009 from the initial report. 09-DEC-2009, the patient received her second dose of GARDASIL and shortly after that the patient had a miscarriage. It was also reported that the patient had some irregular periods and got pregnant again (WAES# 1001USA03249). The patient did not have any GARDASIL between the pregnancies and will have her third dose when the patient returns to the office and it is confirmed that she is not pregnant. Additional information is not expected.

MedDRA PT Abortion induced, Blood human chorionic gonadotropin positive, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician concerning an 18 year old female with no known medical history and drugs allergies, who on 24-APR-2009 was vaccinated with a 0.5 ml first dose of GARDASIL, intramuscularly. There was no concomitant medication. On 27-APR-2009 the patient discovery that she was pregnant. No adverse effects reported. The patient had a urine pregnancy test at office that was positive. The pregnancy was confirmed with a blood test. The patient LMP was on 01-APR-2009 and her estimated delivery date will be on 06-JAN-2010. The patient sought medical attention through an office visit. Follow up information received from a physician indicated that the patient was a female. On 09-MAY-2009 the patient had an elective termination of her pregnancy. It was unknown if the products of conception were examined or if the fetus was normal. The patient's outcome was unknown. Upon internal review elective termination was determined to be another important medical event. No further information is available.

MedDRA PT Drug exposure during pregnancy, Premature labour

Symptom Text: Information has been received from a physician for the Pregnancy Registry for GARDASIL, concerning a 17 year old female with a medical history of vaccine exposure to pregnancy (WAES #0901USA01198) who on 11-DEC-2008 was vaccinated with one dose of GARDASIL (lot # 660391/0063X) IM in her deltoid. After the vaccine exposure to the initial pregnancy, the patient transferred from the physician's care another location. The physician reported that according to social workers at this agency, the patient delivered on 17-DEC-2009, which was three months early from her due date. The date of LMP was determined to be in June 2009 and EDD was approximately 17-MAR-2010. The physician thought this pregnancy was a different pregnancy from the initial one reported given the dating conflict. The physician added that the mother tested positive for marijuana at that time, and that "there were a lot of other things going on" with this young mother. The physician did not have information on the health and outcome of the baby. Upon internal review, premature labour was considered to be an other important medical event. The baby's experience has been captured in WAES #1001USA02981B1. No further information is available.

MedDRA PT Abasia, Asthenia, Condition aggravated, Fasciitis, Leukocytoclastic vasculitis, Myalgia, Myofascitis, Pain, Pain in extremity, Rash, Rash macular, Rash pruritic, Tenderness

Symptom Text: Information has been received from a physician concerning a 26 year old female patient with a history of asthma and no drug reactions/allergies, who "last week" on approximately 15-JAN-2010 was vaccinated with the first dose of GARDASIL. Concomitant medications included unspecified birth control. On 22-JAN-2010 the patient had sudden onset and worsening of lower extremity leg pain to a point that the patient would not walk and was admitted to the hospital. Creatine kinase was mildly elevated. Sedimentation rate was performed (results not provided). At the time of the report the patient had not recovered. Follow up information has been received from the physician who reported that the patient's MRI revealed mild bilateral fasciitis of the lower extremities. The patient had elevated ESR and CRP level. The patient was treated with Non-steroidal anti-inflammatory drugs (not specified). The patient was referred to a Rheumatologist, Neurologist and infectious Disease specialist. The physician stated that the patient was able to walk at the time of her discharge from the hospital. "Lower extremity leg pain to a point that the patient would not walk" was considered to be disabling. Additional information has been requested. ```2/1/10 Hospital records received for dates of service 1/20/10 to 1/23/10. Dx: Myofacitis, leukocytoclastic vasculitis. Presents with one day hx. of lower leg rash, pain and weakness. Saw PCP 3 days prior for pruritic vulvar rash. Started on valtrex for possible HSV. In past 24 hrs. developed rash on lower legs, diffuse muscle pain distal to knees and weakness of lower legs. Red macules on proximal inner thighs. Significant bilateral calf tenderness. Dorsiflexion limited by pain. Unable to walk. Discharged after 4 days able to ambulate.

Other Meds: Unknown

Lab Data: Magnetic resonance, mild bilateral fascitis of the lower extremities; Serum creatine kinase, mild elevated; erythrocyte, elevated; serum C-reactive, elevated. ```2/1/10 Hospital records received for dates of service 1/20/10 to 1/23/10.Labs

MedDRA PT Abdominal pain upper, Activities of daily living impaired, Cough, Dysphagia, Erythema, Fatigue, Joint swelling, Lethargy, Mobility decreased, Nasal congestion, Nausea, Oedema peripheral, Pain, Pain in extremity, Rash, Rash erythematous, Rash macular, Rash papular, Skin lesion, Tenderness, Vasculitis

Symptom Text: 1.on 1/10 started noticing a rash on her lower legs around her ankles. Kind of just little red dots. 2. The rash kept spreading and getting worse with bigger red blotches all up and down her legs but most heavily concentrated on her lower legs and feet. So, on 1/15 we went to the doctor about the rash, the coughing and an acheness. He didn't know what it was and did some blood work that we wouldn't find out about until Monday (this was Friday). 3. On the evening of 1/17, she had swollen up so bad on her lower legs and ankles that you couldn't see any of her ankle bones, etc. Also was saying that she couldn't hardly swallow so I was concerned that throat was swelling like the legs. So, I took her to the emergency room. They did blood work but said nothing showed up. They started tossing out possible things like lupus and auto-immune disease. I don't think I told the doctors there about her just having had the 3rd gardisell shot. They gave her 60 mg a day of prednisone for 4 days. 4. As of 1/30, she is in severe pain on her lower legs, fatigued, stomach hurts, very nauseous which could be from meds. We have been in repeated contact with the doctor and after several changes in doses of prednisone, she is currently doing 40 mg a day, Lortab as needed for pain and a diuretic. She couldn't go to school Thursday. The days prior she could go but by the end of the day her legs were so swollen and hurt and she could hardly move or use her left one which is the worse. She has now been on the couch or in bed for 3 days straight. ```records received 02/01/2010. ED rec. for 01/18/2010. DX: Skin rash Patient presented with c/o rash and worsening swelling of legs. The rash had a gradual onset and had started a week ago. Examination noted swelling and tenderness in bilateral lower legs. The rash was described as red slightly raised lesions, which did not blanch when touched. The patient was discharged home and given prescriptions for prednisone and Lortab. The patient was counseled to follow-up with PCP in 1-2 days as sym

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician, for the Pregnancy Registry for GARDASIL, concerning a 17 year old female with no pertinent medical history and no drug reactions/allergies who on 09-OCT-2008 was vaccinated with the first dose of GARDASIL, 0.5 milliliter, intramuscular. Concomitant therapy included MENACTRA and tetanus toxoid. The physician reported the patient who received her first dose of GARDASIL was pregnant. The patient said she was not pregnant at the time of the office visit and refused a pregnancy test at that time. The patient's mother called the office later in the day and said the patient was pregnant and her last menstrual period was "2-3 weeks ago" which was on approximately 18-SEP-2008-25-SEP-2008. No adverse effect reported. The patient sought medical attention at office visit. Follow-up information was received from the physician who reported that the teenager and parent decided terminated pregnancy with parental consent. Upon internal review, terminated pregnancy was considered to be an other important medical event. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Dizziness, Headache, Syncope, Tinnitus

Symptom Text: As patient was walking out of building, approximately 15 minutes following vaccination, had sudden onset of ringing of ears, headache and lightheadedness. Did not report this to facility. Headache persisted for 24 hours. On 1/30/10, while kneeling at church, fainted. Mother raised her legs and child recovered quickly. Did not seek medical care.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Abnormal behaviour, Anger, Ataxia, Blood product transfusion, Cerebellar syndrome, Depression, Dizziness, Dyskinesia, Eye movement disorder, Gait disturbance, Headache, Hyperglycaemia, Hypokinesia, Mood altered, Muscular weakness, Opsoclonus myoclonus, Reflexes abnormal, Vertigo, Visual impairment

Symptom Text: Information has been received from the author of the literature article title as stated above concerning an 11 year old female with seasonal allergies and mild asthma. Her initial symptoms consisted of a sudden onset of increased "moodiness" causing uncharacteristic anger and depression. These symptoms presented approximately 15 days after receiving her first dose of GARDASIL vaccination on 26-NOV-2007. The uncharacteristic behavior persisted and 1 month after initial mood changes she noted that her "eyes were doing weird things" and she perceived that visual images went "back and forth in circles". The abnormal ocular movements occurred with her eyes closed or open, and could be only minimally suppressed with great effort. There were no other symptoms at this time, however, her eye symptoms became more frequent and troubling to her. She then received the second dose of vaccine 2 months later in addition to MENACTRA vaccine. Four days after these vaccinations she developed noticeable worsening of the eye movements and acute perception of dizziness, which she described as the "room is spinning". This was accompanied by leg weakness requiring assistance to walk and "jumpy arms". Family history revealed a cousin with childhood epilepsy, maternal great aunt with lupus, maternal grandfather died of a rupture aneurysm at age 40, and mother with fibromyalgia, but no movement disorders or paraneoplastic syndromes. Initial examinations revealed conjugate opsoclonus with or without eyelid closure that worsened with attempts to maintain visual fixation. Optic discs were sharp. Cranial nerves were intact. There was mild weakness and impersistence of force in quadriceps, hamstrings, tibials anterior, hip adductors, abductors and iliopsoas. Mycoclonus was noted in upper and lower extremities, but was worse in the upper extremities. Trunk strength was preserved in the supine position with the patient able to perform sit-ups, but weakened with standing. Sensation to all modalities was intact. Myotactic tendon reflexes were brisk

Other Meds:

Lab Data: Physical examination, see narrative; ophthalmological exam, see narrative; diagnostic radiology, multiple imaging studies were normal with no evidence of nebroblastoma, gaglioneuroma or other mass; electroencephalography, normal; serum gluc

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Limb malformation, Muscle atrophy, Weight decreased

Symptom Text: Information has been received from a physician concerning a female patient who on an unspecified date was vaccinated with the second dose of GARDASIL. The patient was hospitalized with "muscle loss and weight loss" after the second vaccination. It was reported that the patient's "limb were turning inward". It was unknown if the patient was still hospitalized, and the outcome was unknown. The reporter felt that the events were not related to therapy with GARDASIL. No further information is available.

MedDRA PT Sensory disturbance

Symptom Text: Case received from a health professional in a foreign country on 22-JAN-2010. This case is poorly documented. It was reported by a gynaecologist that a previous healthy 15 year old female patient was vaccinated with a third dose of GARDASIL (lot #, injection route and site not reported) on 18-NOV-2009. A few days post vaccination, the patient developed impaired sensibility (not otherwise specified). The reporter assumed that the patient was hospitalized. Lumbar puncture and magnetic resonance imaging (MRI) were carried out and showed no pathological findings. The patient recovered spontaneously within two months. The reporter pointed out that around the time of vaccination the patient restarted medication with hormonal contraceptives. The first and second doses of GARDASIL were well tolerated. Other business partner numbers included E201000512.

Other Meds: hormonal contraceptives (unspecified)

Lab Data: Spinal tap, no pathological findings; magnetic resonance imaging, no pathological findings

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from an office manager, for the GARDASIL a Pregnancy Registry concerning a 16 year old female patient with depression, allergy to penicillin, amoxicillin, BACTRIM, CECLOR, erythromycin and a history of cesarean section performed less than a year ago and kidney stones with her last pregnancy who was vaccinated with the first, second and third dose of GARDASIL, 0.5 mL, intramuscularly, on 20-MAY-2008 (lot # 655604/0052X), 22-JUL-2008 (lot# 0250X) and on 25-NOV-2008 (lot # 0947X) respectively. Concomitant therapy included oral birth control pills (unspecified) and probably ZOLOFT. It was reported that the patient is pregnant. LMP was 31-OCT-2008. EDD was 07-AUG-2009. The patient sought medical attention at the physician's office. Follow up information has been received from an office manager concerning the 16-year-old female patient and revealed that the patient had a termination of pregnancy on 10-JAN-2009 at 10 weeks of gestation. The reporter stated that the patient did not terminate the pregnancy due to the vaccine, rather she had multiple or other personal reasons. The reporter indicated the patient had no problems with the procedure and recovered well. Upon internal review, termination of pregnancy was determined to be an other important medical event. Additional information has been requested.

Other Meds: hormonal contraceptives; ZOLOFT

Lab Data: urine beta-human, pregnant

History: Cesarean section; kidney stone

MedDRA PT Abasia, Arthralgia, General physical health deterioration, No reaction on previous exposure to drug, Ultrasound scan normal

Symptom Text: Information has been received from a health agency (reference number: PEI2009022113) on 20-OCT-2009 concerning a 15 year old female who on 23-SEP-2009 was vaccinated IM with a second dose of with GARDASIL (lot # 1316U, batch # NH38490) in to the deltoid muscle (side not reported). On 23-SEP-2009 the patient experienced pain in both knee. She was hospitalized on an unknown date for unspecified time. Following diagnoses were ruled out: borreliosis, rheumatoid arthritis and an inflammation. Laboratory: CRP, antibodies IgG and IgM (not otherwise specified), rheumatoid factor, ANA (antinuclear antibodies), ANCA (antineutrophile cytoplasmatic antibodies) and AMA (antimitochondrial antibodies) were without pathological findings. The patient recovered within five days on approximately 28-SEP-2009. First vaccination with GARDASIL (lot # 0933U, batch # NH46260) on 20-JUL-2009 was well tolerated. Follow-up information received on 26-JAN-2009 concerning the patient with a medical history of pollinosis and no known rheumatoid diseases in family history. Concomitant therapy included hormonal contraceptives for systemic use. The hospital report was provided by HA. The patient was hospitalized from 25-SEP-2009 to 28-SEP-2009 due to continuous and unbearable pain in both knees. The patient was not able to walk. Pain was defined as 8 in a scale up to 10. Treatment with paracetamol and DOLORMIN did not succeed. The patient was admitted to hospital in reduced general condition. Weight 46 kg and body height 157 cm. Both knees were painful at flexion, left more than right. Internal and external rotation caused also more intense pain at the left knee than at the right one. Laboratory: BSG 5/14 mmn W(no normal range); CRP 0.02 mg/dl (no normal value reported); Antistreptolysin: 102 IU/ml (within the normal range); Anti-Dnase B: 195 IU/ml (normal range: 0-187 IU/ml); Borrelia-IgG and IgM antibodies negative; Rheumatoid factor < 20; ANA 1:<40, negative; AMN 1:<40, negative; cANCA/pANCA 1:<10, negative; Fibrinogen 321 mg/dl (no normal valu

Other Meds: Hormonal contraceptives (unspecified)

Seriousness: LIFE THREATENING, SERIOUS

MedDRA PT Nausea, Pallor, Swollen tongue

Symptom Text: Information has been received from a agency (report # 087890) via Case Line Listing via CSL as a part of a business agreement concerning a 19 year old female who on 17-DEC-2009 was vaccinated intramuscularly with the first 0.5 ml dose of GARDASIL (lot# NJ02680; batch# NJ43980). On 17-DEC-2009, less than 1 hour after vaccination, the patient experienced pallor (not severe), nausea (not severe) and tongue swelling non specific (severe). At the time of report the patient had recovered without sequelae. The agency felt that pallor, nausea and tongue swelling non specific were probably related to therapy with GARDASIL. Tongue swelling, non-specific was considered to be life-threatening. The original reporting source was not provided. A lot check has been initiated. No further information is available.

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Arthralgia, Back pain, Clumsiness, Computerised tomogram, Dizziness, Dysphagia, Extensor plantar response, Fall, Gait disturbance, Headache, Hypoaesthesia, Loss of consciousness, Muscular weakness, Neuropathy peripheral, Nuclear magnetic resonance imaging, Pain, Pain in extremity, Paraesthesia, Syncope

Symptom Text: Within 1 month after receiving vaccination progressive clumsiness noted with complaints of leg pain with inability to run without falling. Eventually, lost ability to run and only able to participate in some aspects of gym classes. Alternate written assignments had to be done. On April 9,2008 had severe pain to left leg while in bed. While stepping up onto school bus, passed out. Complained of dizziness at that time. pain progressed to right leg that day with tingling and numbness. Taken to ED, CT scan of head and labs done. Referred to neurologist. Many blood tests performed, EMG, nerve conduction studies, MRI's. May 1, 2008 reported right leg pain worsening and now present in right hip and waist. Referred to neurologist due to progressive weakness and right leg lag. Adaptations have had to be made at school through the 504B plan to accomodate for her disabilities. Stairs are very challenging. Swallowing difficulties started within last 3 months. Now seeing neurologist, rheumatologist, endocrinologist to find cause of proximal weakness. Lots of autoimmune studies have been done and repeated. No answer to this problem for a child who was in perfect health prior to this vaccination. Bills are immensely expensive and continue. ```2/4/10 to 2/15/10 MR, hospital records received for dates 6/3/08 to 2/1/10. DX: neuropathy, syncope and collapse, muscle weakness, vitamin D deficiency. CC: 6/08 leg pain and numbness since 4/08. Pt states pain started in left leg, walking made sx worse, starting in pt back then down leg. Then rt leg pain/tingling. Currently localized sharp pain/tingling from knee down to ankle. Pt states now c/o arm weakness x1 month. Pt states has had LOC x4 episodes stating feeling weak and HA prior to LOC episode. Pt states HA are pounding. Babinski sign downgoing bilat, reduced strength noted. PT note: posture unremarkable, good alignment, ROM WNL, decreased balance and weakness.

Other Meds: NONE THAT I CAN RECALL

Lab Data: EMG - showed some disparities right to left. Lupus studies - negative thus far, muscle enzymes - WNL Basic chemistries and hematology testing WNL VIT D level < 6 - started on Vit D supplements - seeing endocrinologist Recent DS DNA posit

MedDRA PT Injection site pruritus, Injection site rash, Rash pruritic

Symptom Text: Information has been received from a nurse practitioner concerning a 20 year old female patient with urinary tract infection who on 10-SEP-2009 and 21-DEC-2009 was vaccinated with a first and second dose of GARDASIL, 0.5 mL, IM, (Lot # 0053X and 0455Y respectively). Concomitant medication included unspecified sulfonamide (prescribed by another physician) and birth control therapy unspecified. The patient experienced the onset of an itchy rash at the injection site a few hours after the second dose. The rash spread from the injection site to include the whole arm and chest. The patient was evaluated at an unspecified urgent care facility and was treated with intravenous steroid medications. The patient was prescribed oral steroid medications and BENADRYL. The patient reported to the office by phone on 23-DEC-2009 that she was "greatly improved". The nurse practitioner added that the patient was also taking an unspecified sulfonamide for a urinary tract infection at the time of the onset of the rash. No lab diagnostic studies were performed. At the time of this report, the patient recovered on unspecified date. Upon internal review, pruritic rash treated with IV steroids was considered an other important medical event. Additional information has been requested.

MedDRA PT Head injury, Hearing impaired, Syncope

Symptom Text: Information has been received from a foreign Health Authority (ES-AGEMED-922092341) concerning a 15 year old female patient who was administered on 13-JAN-2010 with a dose of GARDASIL (batch # and site not reported), by intramuscular route. It was reported that two minutes after vaccine administration, the patient suffered a faint hitting her forehead. She recovered from syncope although she "heard strange" (as reported). The patient was referred to the hospital for observation (hospital admission not reported). The patient's heart pressure was 100/50, she had 86 bpm and O2 saturation of 96. The outcome is unknown. Case reported as serious per reporter with other medically important condition as criteria. Other business partners included E2010-00635.

MedDRA PT Influenza like illness, Radiculitis, Sensory disturbance, Troponin increased

Symptom Text: Case received from health authority on 28-JAN-2010 under HA reference no. PEI2009007481. It was reported that a 17-year-old female patient was vaccinated with a first dose of GARDASIL (batch number NH38400, lot# 1400U) IM on 07-MAY-2009, injection route not reported. On an unspecified date in May 2009 the patient developed transient increased troponin P for one day, flu-like symptoms for several days and radiculitis with sensory phenomenon. Suspicion associated generalized imme reaction was established (HA did not code this diagnosis). The patient was hospitalized on an unspecified date. MRI of cervical and thoracic spine, liquor puncture, blood examination and ECG were carried out and supported the diagnosis (not otherwise specified). Myelitis and multiple sclerosis were ruled out. At the time of reporting to HA (30-NOV-2009) the patient had not recovered. Other business partner numbers include E2010-00646. Additional information has been requested.

MedDRA PT Congenital anomaly, Drug exposure during pregnancy

Symptom Text: Information has been received from Merck Pregnancy Registry for GARDASIL from a Nurse practitioner concerning an 18 year old female with AUGMENTIN allergy and no pertinent medical history who on 06-OCT-2008 was vaccinated with first dose of GARDASIL (Lot # not reported). Concomitant therapy included ZOFRAN. On 08-DEC-2008 she received second dose of GARDASIL (Lot # not reported). When she received second dose of vaccine she was pregnant. Patient had last menstrual period on 13-NOV-2008. Estimated date of delivery was 29-AUG-2009. The nurse practitioner reported that the mother delivered a female on 03-SEP-2009 that has been diagnosed with Laryngomalacia. According to the nurse practitioner, a few days after the birth, the mother brought the baby into the Emergency Room at their hospital with stridor and the baby was transported to a Department of Otolaryngology in a university for care. She said she was told "the baby has extra tissue in the throat", and "along with the stridor which was related to the laryngomalacia, the baby has had reflux and pneumonia at some point too." The nurse practitioner added that it was congenital, but did not state who provided that information. The nurse practitioner added that the baby was gaining weight appropriately. At the time of the report the baby's status was unknown. The infant's laryngomalacia was considered a congenital anomaly. The mother's experience is reported is WAES 0901USA03985. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Convulsion, Laboratory test, Vaccine positive rechallenge

Symptom Text: Information has been received from an office manager who reported that she received an email from a friend concerning a female patient who was vaccinated with the first dose of GARDASIL and about three and a half weeks later began having seizures. Then, the seizures started to intensify after the second and third doses of GARDASIL. It was reported in the email that "for the last two and a half years, the patient had been dealing with seizures. Having never had problems like this, they came out of nowhere". It was reported that the patient had "every test imaginable run, seen various doctors and tried different medicines. There had been times of respite from them, the most recent one lasting 8 months, until 'a couple Fridays ago' when they started back again". It was also reported that "after a lot of research, the patient's parents believed that the root cause of everything was the GARDASIL shot. The patient's episodes began about three and a half weeks after getting the first shot and increased with intensity after getting the second and third ones". The office manager reported that she knew nothing of the patient or situation except through the email which was circulated to her. Upon internal review, seizures were considered an other important medical event. This is one of several reports from the same source. Additional information is not expected.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Beta haemolytic streptococcal infection, Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse for the pregnancy registry for GARDASIL concerning a 17 year old female patient with history of anger issues, who on 03-DEC-2008 was vaccinated with the second dose of GARDASIL (Lot 660553/0070X). Concomitant therapy included HAVRIX and hormonal contraceptives (unspecified). Nurse reported that a patient who is now pregnant received her second dose of GARDASIL on 03-DEC-2008. Nurse reported that the patient had received her first dose of GARDASIL over a year ago. A pregnancy test on 22-SEP-2008 was negative and a pregnancy test on 08-OCT-2008 was positive. At the time of the report the patient had a confirmation test done (sonogram). No specific adverse event was reported related to the pregnancy. The patient sought unspecified medical attention. Follow up information has been received from a physician who reported that on 24-JUN-2009 the patient delivered by C-section due to bradycardia a male healthy baby at 41 weeks of gestation. The baby's weigh was 7 pounds 4.6 oz. The physician also reported that on an unknown date the patient experienced a group b streptococcus infection. The patient present status was unknown. Upon internal review C-section due to bradycardia was considered to be other important medical event. Additional information has been requested.

Other Meds: HAVRIX; hormonal contraceptives

Lab Data: ultrasound, confirms 12 weeks gestation; beta-human chorionic, 09/22/08, negative; beta-human chorionic, 10/08/08, positive

MedDRA PT Death, Drowning, Fall

Symptom Text: Information has been received from from a physician concerning a 12 year old school going girl of class eight of a village. On 20-JUL-2009, the patient received first dose of GARDASIL in the school. During the process of community mobilization for second dose of GARDASIL, the female health worker was informed that on 06-SEP-2009, the patient accidentally fell in open well (granite quarry filled with water), drowned and expired. This event occurred 49 days of receiving first dose of GARDASIL. The female health worker informed the Medical Officer in-charge, which was then communicated to District Immunization Officer. The medical officer in-charge investigated the death and completed first information report and determined that death was not related to the vaccine.

MedDRA PT Myositis, No reaction on previous exposure to drug, Visual acuity reduced

Symptom Text: Information has been received from a nurse concerning her 16 year old female daughter with a history of tonsillectomy who was vaccinated with a second dose of GARDASIL (injection site and route not reported) on 26-APR-2007. Concomitant medication included AIDA (hormonal contraceptives). Approx. 5 weeks p.v. the patient experienced relapsing orbital myositis with decreased vision. She was hospitalized twice (exact dates not reported). A focus search was negative, infective causes could not be verified. A "heumatologic disease" was assumed. The first dose GARDASIL, given on 15-FEB-2007, was well tolerated. Despite ongoing symptoms, the third dose was given on 01-OCT-2007. Other business partner's numbers included: E2010-00612. No further information is available.

MedDRA PT Benign intracranial hypertension, Bronchitis, CSF pressure increased, Decreased activity, Diplopia, Headache, Intracranial pressure increased, Lumbar puncture, Muscle twitching, Nausea, Pain, Paraesthesia, Rash, Urticaria, Vision blurred, Visual impairment, Vomiting

Symptom Text: Information has been received from a health professional concerning her daughter an 18 year old female who in October 2007, was vaccinated with the first dose of GARDASIL (lot number not reported). There were no pertinent medical history and drug reactions/allergies. Concomitant therapy included RECOMBIVAX HB (unspecified). The healthcare worker reported that her daughter developed "stabbing head pain associated with a twitch" in approximately October 2007 about 2 weeks after she received her first dose of GARDASIL. The patient had been diagnosed with pseudotumor cerebri which limited her physical activity and she was hospitalized. The patient's pseudotumor cerebri persisted. The patient underwent lumbar puncture to relieve fluid pressure. Multiple unspecified blood tests and diagnostic studies were performed with results not report. Pseudotumor cerebri was considered to be disabling, immediately life-threatening and an other important medical event by the healthcare worker. Follow up information was received from a healthcare professional who reported the patient was vaccinated with the first dose of GARDASIL on 28-FEB-2007, the second dose of GARDASIL on 15-OCT-2007, and the third dose of GARDASIL on 01-JUL-2008 (lot numbers not reported). Concomitant vaccine included MENACTRA received on 28-FEB-2007 and VAQTA (unspecified) received on 28-FEB-2007 and 15-OCT-2007 (lot number not reported). At the 28-FEB-2007 office visit, the patient had bronchitis. At the 15-OCT-2007 office visit, there was no mention of any adverse event. On 23-OCT-2007, the patient was seen for hives and ZYRTEC was given. On 30-OCT-2007, the patient complained of pins and needles all over, rash was gone. On 28-NOV-2007, the patient complained of blurred vision, and a neuro consult was directed. In November and December 2007, the patient was admitted to the hospital (no other details available). In November 2008, the patient was admitted for nausea, vomiting and headache (no other details). On 05-JUN-2009, the patient was last seen in their o

Symptom Text: Information has been received from a medical assistant concerning a 16 year old female patient with sulfonamide and azithromycin allergy who on 30-JUN-2009 was vaccinated intramuscularly with the first 0.5ml dose of GARDASIL (lot# 659655/0940X). On 01-SEP-2009 the patient was vaccinated intramuscularly with the second 0.5ml dose of GARDASIL (lot# 663452/0671Y). Concomitant therapy included SPRINTEC. On approximately 07-JUL-2009 ("a week after administration of her first dose of GARADSIL"), the patient experienced fainting spells, stomach pains, weight loss of 16 pounds, swollen glands in the neck and fatigue. It was reported that the patient experienced the same symptoms but more intense after her second dose of GARDASIL administered on 01-SEP-2009. When she experienced a fainting spell, she was exhausted for the rest of the day. The patient still continued to have episodes of blacking out and stomach pain once or twice a week. The patient had been examined and had a complete work up from a neurologist, gastrologist and cardiologist. All tests were negative. At the time of this report, the patient was recovering. Follow up information has been received from the medical assistant who confirmed the dates and lot #s for the two doses of GARDASIL and reported that there were no concomitant vaccines were administered. She clarified that the events, experienced a week after the first dose, persisted then worsened after administration of the second dose. The events were considered as disabling since the patient could not attend school. It was unknown if the patient was hospitalized. The patient had not seen in their office since 01-SEP-2009. Fainting spells, stomach pains, weight loss of 16 pounds, swollen glands in the neck, fatigue and episodes of blacking out were considered to be disabling. Additional information has been requested. ``` records received 02/10/10 & 02/11/10. Clinic rec and cardiology, neurology and ENT consults for DOS 06/30/09-12/14/09. MedDRA PT Convulsion, Syncope

Symptom Text: Information has been received from a physician concerning a 17 year old female who in November 2009 (day unknown), was vaccinated with the first dose of GARDASIL, and on 29-JAN-2010 was vaccinated with the second dose of GARDASIL. On 29-JAN-2010 after the application of the vaccine, the patient experienced syncope for 1 minute and convulsion for 40 seconds. Subsequently, the patient recovered from syncope and convulsion without sequels. The patient did not consult to the emergency room and did not receive any treatment. The reporter felt that syncope and convulsion were related to therapy with GARDASIL. Upon internal review, the patient's convulsion was considered to be other important medical event. Additional information has been requested.

MedDRA PT Diabetes mellitus, Guillain-Barre syndrome, Miller Fisher syndrome, Myopathy

Symptom Text: Information has been received from a health care professional. This case is poorly documented. It was reported by a general practitioner that an adolescent female patient was vaccinated with a dose of GARDASIL (lot number and dose in series not reported) IM into the upper arm in Spring 2009. Unspecified time post vaccination, the patient developed a MILLER FISHER syndrome, suspicion of GUILLAIN-BARRE syndrome, myopathy and diabetes mellitus. Non-specific autoimmune processes were assumed. At the time of reporting, the patient was treated with gabapentin. The further course and outcome were not reported. The events of autoimmune disorder, GUILLAIN-BARRE syndrome, MILLER FISHER syndrome, myopathy and diabetes mellitus were considered Other Medically Important Conditions. Other business partner numbers include: E2010-00607. No further information is available.

MedDRA PT Multiple sclerosis

Symptom Text: Information has been received from a pediatrician concerning a 17 year old female patient with no history reported who was vaccinated with a dose of GARDASIL (lot#, injection route and site not reported) on an unspecified date. Subsequently the patient developed multiple sclerosis. The patient's outcome was unspecified. The multiple sclerosis was determined to be serious as an other important medical event. Other business partner number include E2010-00726. Additional information has been requested.

MedDRA PT Congenital anomaly, Drug exposure during pregnancy, Hepatoblastoma, Hepatomegaly, Mass

Symptom Text: information has been received from a registered nurse from a completed questionnaire from a pregnancy registry concerning a female baby, whose mother had a history of 0 pregnancies and 0 live births and a concurrent condition of venous angioma and a history of cervical dysplasia. On 30-JAN-2009, the mother was vaccinated with the third dose of GARDASIL (lot no. 660618/0572X) 0.5 ml, IM. First dose was given 30-JAN-2007 and second dose on 30-MAR-2007 (Lot # 656049/0187U). Concomitant therapy included prenatal vitamins (unspecified). On 06-FEB-2009 the mother found out she was pregnant. On 06-OCT-2009, the patient born weighing 7 lbs 12 oz, length 20 cm and Apgar score 9/9. At pediatrician visit at 8 weeks, a "patoblastoma" was discovered. Additional information was received from a registered nurse and a consumer. The consumer clarified that her daughter had a "hepatoblastoma, a tumor on her liver." She said it was during a well-baby check that the pediatrician noted an enlarged liver. The baby was referred to oncologist. The registered nurse reported that it was the pediatrician who ordered the ultrasound which was performed on 11-DEC-2009. The study showed a 10 X 7.2 cm mass in the right lobe of the liver. The baby was then admitted to the hospital. A Computed Tomography scan done on approximately 11-DEC-2009 showed a large mass. A Magnetic Resonance Imaging was also done (results not provided). On 15-DEC-2009, a biopsy and the elevated (60,527) alpha fetoprotein (AFP) test confirmed the hepatoblastoma. Chemotherapy was started on 18-DEC-2009. At present, the baby was doing well. The latest AFP was down to 500. Chemo continued and eventually surgery would be required. The registered nurse could not link any causality to the hepatoblastoma. The mother's experience has been captured in WAES 0902USA03113. Hepatoblastoma was considered to be a congenital anomaly. Additional information has been requested.

Other Meds: Vitamins (unspecified)

Lab Data: Ultrasound, 12/11/09, showed a 10 X 7.2 cm mass in the right lobe of the liver; Computed axial, 12/11?/09, showed a large mass; Magnetic resonance, 12/11?/09, results not provided; Biopsy, 12/15/09, confirmed the hepatoblastoma; Serum alpha

MedDRA PT Completed suicide, Death, Poisoning

Symptom Text: Information has been received from a physician concerning a 14 year old school going girl (ID#: -3/09) who received the first dose of GARDASIL in left deltoid, on 16-JUL-2009. Concomitant therapy included indigo. During the process of community mobilization for second dose, the female health worker was informed that the patient committed suicide on 29-AUG-2009 by consuming insecticide. The postmortem was performed on 30-AUG-2009. This event occurred after 45 days of receiving first dose of GARDASIL. The female health worker informed the medical officer in charge, which was then communicated to Immunization Officer. The medical officer in charge investigated the death and completed first information report as per guidelines and determined the death was not related to the vaccine and so no further investigations were done. No further information is available.

MedDRA PT Leukaemia

Symptom Text: Information has been received from the agency via a Case Line Listing via CSL, as part of a business agreement, concerning a 17 year old female who on 04-SEP-2009 was vaccinated IM with a second 0.5ml dose of GARDASIL (lot# 1694U, batch# NJ21420). In December 2009, less than 1 year after vaccination, the patient experienced leukaemia (severe) and was hospitalized. The patient's leukaemia persisted. The reporter felt that leukaemia was unlikely related to therapy with GARDASIL. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Completed suicide, General physical health deterioration, Poisoning deliberate

Symptom Text: Information has been received from a physician concerning a 13 year old school going girl (ID#: -104/09) of class eight. On 19-JUL-2009, patient received first dose of GARDASIL left deltoid (lot#876, manufacturing date June 2008). Patient successfully completed her second dose on 13-OCT-2009. She was due with her third dose. On 21-JAN-2010, she was reported to have consumed poison around 9:00 am. She was taken to the area hospital and provided preliminary emergency treatment. She was provided DECADRON injection 2 cc, injection dopamine 1 amp. in 5% dextrose 10-12 drops/min, injection deriphylline I.V 8 hourly, injection diazepam 1 amp. IV, Ryle's tube aspiration and stomach wash. It was advised to record her temperature, pulse, respiration, and blood pressure half hourly and had oxygen inhalation. High risk consent was taken. As her condition started to deteriorate she was shifted to another hospital by '108 emergency service' for further evaluation and management. On the way to the hospital, it was reported to have expired around 2:00 pm on 21-JAN-2010. The hospital noted the case was "brought dead". The postmortem was performed on 22-JAN-2010 and the results are awaited. The medical officer in charge investigated the death and completed first information report and determined the death could be suicide (due to poison intake) and not related to the vaccine. This report was part of a post-marketing surveillance program.

MedDRA PT Agitation, Aphasia, Asthenia, Confusional state, Dysstasia, Headache, Hemiparesis, Laboratory test abnormal, Migraine, Paraesthesia, Psychomotor hyperactivity, Speech disorder, Vision blurred

Symptom Text: Case reported by Health Authority (case n. 110513) (local case n. IT038/10). Initial report received on 26-JAN-2010. An 11 year old female patient with no previous medical history who on 01-DEC-2009 was vaccinated with the first dose of GARDASIL (lot# NJ29430, batch# NK18100) IM. On 05-DEC-2009 the patient presented with a strong migraine associated with right hemiparesis, speech difficulty, confusional state. She was taken to the ER where she was treated with TACHIPIRINA without benefit and NOVALGINA. She was evaluated by a neurologist that diagnosed "confusional migraine". The case was reported as not serious by both the HA and the reporter and upgraded to serious by Company based on internal rules. The outcome is recovered on 06-DEC-2009. The case is closed. To note, Health Authorities coded only confusion, hemiparesis and migraine. Follow-up information has been received on 05-FEB-2010: the report by the patient's physician was received through HA. The patient's maternal grandmother has a positive history for migraine; her paternal grandmother has a positive history for bitemporal headache. At 6 months of age the patient presented with scarce usage of the upper right limb for which she was evaluated neurologically for which she underwent physical therapy. She regained complete function within one year. From 6-8 year of age she suffered from headaches monthly. Positive for allergy to amoxicillin (+) clavulanate potassium and azithromycin (cause face angioedema). On 01-DEC-2009 the patient was vaccinated the first dose of GARDASIL (lot# NJ29430, batch# NK18100) with no adverse effect. She was engaged in swimming at an agonistic level. On 05-DEC-2009, following 3 hours of swimming practice, the patient presented with nuchal headache followed one hour later by dysphasia, paresthesia of the right hemisoma and blurring of the right eye. She was taken to the ER where she still presented with psychomotor agitation, dysphasia, inability to keep the standing posture because of hyposthenia right hemisoma, testing positi

MedDRA PT Coma, Death, Dyspnoea, Pyrexia

Symptom Text: Information has been received from a physician concerning a 13 year old school girl studying in class nine of health center. On 17-JUL-2009, patient received first dose of GARDASIL left deltoid. Concomitant medications included chloroquine, RANTAC, paracetamol, "IV fluids RL" and aminophyline drip. During the process of community mobilization for second dose of GARDASIL the multipurpose health worker was informed that the patient developed fever on 01-AUG-2009 and was treated by local registered medical practitioner (RMP). The patient did not recover and was admitted to the hospital on 08-AUG-2009. On the same day, GENTAMYCIN was given. She developed dyspnoea and went into coma and so was referred and was shifted to another hospital where she expired on 08-AUG-2009 at around 9:00 pm. The cause of death was determined as "death due to viral fever". The information was provided from patient's maternal grandparents as she was staying with them. This event occurred after 23 days of receiving first dose of GARDASIL. The female health worker informed the medical officer in charge and he investigated the death and completed the first information report as per AEFI guidelines. The case sheet mentions as "pyrexia of unknown origin". This information was then communicated to district immunization officer, who determined that the death was not related to the vaccine and so a decision was taken to close the investigation.

MedDRA PT Immediate post-injection reaction, Loss of consciousness, Syncope, Vomiting

Symptom Text: Information has been received via a business partner company from a 31 year old female who on 09-FEB-2010 was vaccinated with GARDASIL (intentional use for unlabelled age). On 09-FEB-2010 the patient experienced passing out and one vomiting while unconscious. It happened while she was massaging the injection site with an alcohol swab at the hospital right after the vaccination. The patient received unspecified treatment, and recovered in an hour without any problems. Upon internal review in the business partner company, syncope was considered to be an other important medical event. The causality with GARDASIL was not reported. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Convulsion

Symptom Text: Information has been received from a consumer reporting that he knows of several cases of seizures after receiving GARDASIL vaccine. Upon internal review, seizures was considered to be an other important medical event. This is a hearsay report in the absence of an identifiable patient. Attempts to verify the existence of a patient have been unsuccessful. This is one of two reports from the same source. Additional information is not expected.

MedDRA PT Deafness, Headache

Symptom Text: Information has been received from a nurse practitioner concerning a 24 year old female patient with no known allergies or pertinent medical history, who on 13-JAN-2010 was vaccinated with the first dose of GARDASIL (lot number and route not reported). Concomitant therapy included hormonal contraceptives (unspecified). On approximately 13-JAN-2010 "within 24 hours after vaccination", the patient experienced severe headache and hearing loss for 5 hours. On approximately 13-JAN-2010, the patient went to the emergency room. On 14-JAN-2010 the patient recovered from the severe headache and the hearing loss. No tests or studies were performed. Upon internal review, the hearing loss was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Asthenia, Chest pain, Dysaesthesia, Guillain-Barre syndrome, Hyperaesthesia, Hypersensitivity, Incorrect route of drug administration, Myalgia, Nervous system disorder, Pain, Paraesthesia, Vertigo

Symptom Text: Information has been received from a physician concerning an adolescent female (age unspecified) who in October 2009, was vaccinated with the first dose of GARDASIL (batch number not reported). Three days after vaccination, the patient presented with a partial "little reaction evoking a Guillain Barre Syndrome", characterized by thoracic pain, hyperesthesia of the lower limbs and metameric hypersensitivity. The reaction regressed within 10 days. The pain evoked a zona, but this diagnosis was ruled out. At the time of reporting, the patient had recovered. Upon internal review the event was considered medically significant. Follow-up information received through PV form, neurological reports and laboratory results on 29-JAN-2010: This is a case of misuse. The patient was 14 years old. She received her first dose of GARDASIL (batch number NH43700, lot number 1648U) via subcutaneous route-instead of intramuscular as recommended-in the left arm or the left shoulder on 16-OCT-2009. 48 hours after vaccination, she experienced myalgias during 8 days. Three days after vaccination, she developed neurological disorder during 15 days. She presented with a significant left dorsal dysesthesia with spread to the left lower limb. This was also three days after vaccination. The clinical examination showed a D4-D10 left dysesthesia, as well as a dysesthesia of the anterior and internal face of the left thigh. There was no motor deficit, osteotendinous reflexes were sharp and symmetric. Cutaneous plantar reflexes were present. The neurologist saw her again on 02-NOV-2009 to perform an electromyography. The patient reported then that her dorsal paresthesias and paresthesia of the left lower limb and almost completely regressed. Biological work-up (hematology and blood chemical work-up) was normal and concluded to a normal electrophoretic profile. The electromyography was normal and did not show any sign of neurogenic pain in the lower limbs. The reporter added that the patient also experienced pain when walking, severe asthenia, pai

MedDRA PT Antineutrophil cytoplasmic antibody positive, Diffuse vasculitis, Renal vasculitis

Symptom Text: Information was obtained on request by the company from the agency via a public case details form concerning a 23 year old female patient who on 27-JAN-2009 was vaccinated intramuscularly with a dose of GARDASIL (Lot not reported). On 12-MAR-2009 the patient experienced multisystem vasculitis with renal involvement, antineutrophil cytoplasmic antibody positive and diffuse vasculitis. Biopsy showed severe vasculitis associated with p-ANCA. The patient correlated the onset of her illness with GARDASIL vaccination 6 weeks prior. Treating clinician (a nephrologist) did not believe there was a clear causal relationship but there was a temporal association. Prior to vaccination patient suffered from arthralgia, weight loss and fatigue. The patient was placed on therapy with cyclophosphamide, prednisolone, rituximab, azathioprine. At the time of report the patient's status was not yet recovered. The agency considered that all the symptoms were related to therapy with GARDASIL. The original reporting source was not provided. No further information is available.

Other Meds: Unknown

Lab Data: biopsy, showed severe vasculitis associated with p-ANCA; serum ANCA, positive

History: Arthralgia; Weight decreased; Fatigue

MedDRA PT Grand mal convulsion, Similar reaction on previous exposure to drug, Syncope

Symptom Text: Information was obtained on request by the company from the agency via a public case details form concerning a 12 year old female patient who on an unspecified date was vaccinated with the first and second doses of GARDASIL. On 15-JUN-2009 the patient experienced syncope and grand mal convulsion. After the first dose of GARDASIL daughter became faint at school. After the second dose of GARDASIL daughter also became faint at school. Five weeks after second dose daughter experienced her first grand mal tonic-clonic seizure, 10 days following another seizure occurred resulting in being taken to hospital (specialist suspected daughter had had other seizures in her sleep). Lab data: albumin test with the result unknown. At the time of report the patient's status was not recovered. The agency considered that all the symptoms were related to therapy with GARDASIL and to be incapacity/disability. The original reporting source was not provided. No further information is available.

MedDRA PT Abscess drainage, Breast abscess, Incorrect route of drug administration, Induration, Lymphadenopathy, Nodule, Similar reaction on previous exposure to drug, Staphylococcal infection

Symptom Text: Case received from a health care professional on 20-NOV-2009. A 14 year-old female patient received a third dose of GARDASIL (batch number not reported) on an unspecified date. Following vaccination, she presented with an abscess on her breast. She had already experienced the same reaction after receiving the second dose of GARDASIL (batch number not reported). The abscess had disappeared later on an unspecified date before reappearing after the third dose. At the time of reporting, the outcome was not reported. Follow-up information received through PV form and hospital report on 17-DEC-2009: This is a case of misuse. The patient had received the first dose of GARDASIL (batch number NH 50490, lot# 1883U) on 22-APR-2009 and the third dose GARDASIL (batch number NJ33350, lot#1202U) on 15-OCT-2009, both via subcutaneous route instead of intramuscular as recommended-in the left deltoid. 31 days after receiving the first dose (instead of the second dose as previously reported), the patient had experienced a periareolar abscess on the right breast which had necessitated a surgical drainage. Bacteriological examination had revealed a staphylococcus epidermidis infection. The patient had been treated with OFLOCET 1 dosage form Bid during 8 days and had recovered. 25 days after receiving the third dose, she developed an abscess on the right breast, associated with axillary adenopathy. She was seen by the reporter on the first day when she presented with the abscess. She was treated with AUGMENTIN and recovered on an unspecified date. No further information expected. Additional information received on 21-JAN-2010: The physician reported that no tests had been performed and she could not confirm whether it was the same infection or not. She did not know whether the patient had adenopathies during the first episode of events. At the time of the second abscess, the patient was found with C-reactive protein (CRP) at 8.7. a sedimentation rate of 20 mm then 46 mm. she considered the relation with vaccination as possible. Follow

MedDRA PT Condition aggravated, Convulsion, Gaze palsy, Inappropriate schedule of drug administration, Loss of consciousness, No reaction on previous exposure to drug, Tremor

Symptom Text: Information has been received from a medical assistant concerning a 17 year old female with PENICILLIN allergy, who tends to pass out with needles and whose father had epilepsy (had a brain injury 20-25 years ago de to an accident) who on 03-FEB-2010 was vaccinated intramuscularly with third 0.5mL dose of GARDASIL (lot number 0670Y). There was no concomitant medication. The medical assistant reported that one and a half minutes later, the patient said she was going to pass out and then the patient passed out. The patient's eyes rolled back, she shook which lasted 15 seconds. The mother's words were "she's having a seizure" and she was holding down the patient. The patient was watched at the office for 30 minutes after this occurrence and she was fine. It was noted that the patient received the first and second doses of GARDADIL at another provider's office. The second dose of GARDASIL (dose, route and lot number not reported) was given on year ago (in February 2009). The patient did not report any problems with the first and second doses of GARDASIL. It was noted that the patient's mother was going to have her daughter follow up with a neurologist. No lab studies were performed. The patient sought unspecified medical attention. On 03-FEB-2010 the patient recovered. Follow up information was received from the office receptionist. It was reported that the patient received did not received other vaccinations at the time of the third GARDASIL vaccine on 03-FEB-2010. Upon internal review, she's having a seizure was determined to be an other important medical event. No further information is available.

MedDRA PT Convulsion, Syncope

Symptom Text: Information has been received from a registered nurse concerning a 14 year old female who on an unspecified date was vaccinated with second dose of GARDASIL (dose, route and lot number not reported). The registered nurse stated that after her second dose of GARDASIL, on 02-FEB-2010, she fainted and had seizure like movements. the patient sought unspecified medical attention. Upon internal review, seizure like movements was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Condition aggravated, Painful respiration, Pericardial drainage, Pericarditis, Pleurisy, Pulmonary embolism, Pyrexia, Upper respiratory tract infection

Symptom Text: Information has been received from a Health Authority (HA ref. 096248) concerning an 18 year old female was vaccinated with the second dose of GARDASIL (batch number and route unknown) on unspecified date in February 2009. HA coded pericarditis (causality unclassifiable) with onset in 2009 (date unspecified). In connection to vaccination (date unknown), the girl experienced periods of fever, painful respiration and increased CRP (=71, Ref. <3). Findings (unspecified) of pericardial and plural liquid were make some weeks later which resulted in hospitalization. The girl remained hospitalized for 10 days on treatment with pericardial drainage, antibiotics (mfr other), NSAIDs (mfr unknown) and prednisolone (mfr other). Investigation including rheumatology and infection consultant could not establish an obvious genesis of pericarditis. A suspicion of mycoplasma due to positive IgM for mycoplasma, though negative PCR. Start of treatment with prednisolone had a positive effect; however the problem with pain remained for a few weeks. In connection to the end of the prednisolone treatment in June 2009 (date not specified), the rheumatology consultant decided that the pericarditis and pleuritis were caused by mycoplasmal infection. The girl was then fully recovered, with no symptoms of chest pain, breathlessness or cough and on no medication. The reporter was wondering about the genesis of pericarditis and pleuritis and reported the event as a suspect adverse event following vaccination with GARDASIL. The previously essentially healthy girl was given the first dose of GARDASIL (batch number and route not reported) on unspecified date in December 2008. A few weeks following vaccination the girl experienced several upper respiratory infections, with symptoms of painful respiration. The case is linked to serious case E2010-00781 (WAES # 1002USA01232): same patient, who following vaccination with the third dose of GARDASIL (June 2009) experienced pulmonary embolism. Other business partner number included E2010-00777. The outc

MedDRA PT Anaphylactic shock, Respiratory arrest, Urticaria

Symptom Text: Serious case received from foreign Health Authorities under the reference number DHH-N2010-50099 on 03-FEB-2010. Case reported as serious (category: life-threatening), additional seriousness category: hospitalization. A 12 year old female patient with pollen allergy and house dust mite allergy were fully under control and had no dependencies to alcohol, tobacco or medication, had received the first dose of GARDASIL (batch number not reported) on 18-JAN-2010 via intramuscular route. There were no concomitant medications. The same day, 30 seconds after vaccination, she experienced an anaphylactic shock characterized by a facial urticaria and complete respiratory arrest. She received epinephrine via intramuscular route, as well as VENTOLIN pump (GSK, puff) and QVAR pump (UCB, puff). The patient was hospitalized for one night for observation. It was reported that the patient has fully recovered, without sequelae. Other business partner numbers include E2010-00793.

MedDRA PT Pulmonary embolism, Similar reaction on previous exposure to drug

Symptom Text: Information has been received from a Health Authority (HA ref. 096248) concerning an 18 year old female was vaccinated with the third dose of GARDASIL (batch number and route unknown) on unspecified date in June 2009. HA reported pulmonary embolism (causality not reported) with onset in 2009, four months post vaccination (date unspecified). The girl was put on treatment with warfarin (mfr other). Coagulation investigation was without any remark and the pulmonary embolism was judged as unprovoked. It was not reported whether the patient was hospitalized or not for this event. The previously essentially healthy girl was given the first dose of GARDASIL (batch number and route not reported) on unspecified date in December 2008. A few weeks following vaccination the girl experienced several upper respiratory infections, with symptoms of painful respiration. The case is linked to serious case E2010-00777 (WAES # 1002USA01070): same patient, the second dose of GARDASIL, other AE. In connection to vaccination (date unknown), the girl experienced periods with fever, painful respiration and increased CRP (=71, Ref. <3). Findings (unspecified) of pericardial and plural liquid were make some weeks later which resulted in hospitalization. Diagnosis: pericarditis and pleuritis caused by mycoplasmal infection. The agency considered pulmonary embolism to be an other important medical event. Other business partner number included E2010-00781. The outcome is unknown. No further information is available. Case is closed.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Decreased appetite, Disturbance in attention, Fatigue, Headache, Lethargy, Migraine, Nausea, No reaction on previous exposure to drug, Performance status decreased, Ultrasound abdomen normal, Vomiting

Symptom Text: Information has been received from a physician concerning a 16 year old female patient who in August 2009, was vaccinated with the second dose of GARDASIL. According to the physician, the patient developed headaches and fatigue after the second dose of GARDASIL. At the time of the report the patient had not recovered. The patient sought medical attention by an office visit. Follow up information has been received from the physician who indicated that the patient was a female student with no known drug allergies/reactions and no pertinent medical history who on 11-AUG-2009 was vaccinated with her first dose of GARDASIL (LOT # 659054/0311Y) intramuscularly into her left arm at 14:10 pm and on 13-OCT-2009 was vaccinated with her second dose of GARDASIL (LOT # 659054/0311Y) intramuscularly into her left deltoid at 13:50 pm. No illnesses were reported at the time of vaccination. It was reported that on approximately 19-OCT-2009 the patient began experiencing headaches, daily nausea, loss of appetite, vomiting, lethargy and inability to concentrate. At the time of the report the patient had not recovered. Diagnostic laboratory tests were performed included a CT scan and the US of abdomen reportedly as normal limits, other diagnostic tests were within normal limits and other labs and hospital visits per other physician. The reporting physician considered headaches, daily nausea, loss of appetite, vomiting, lethargy and inability to concentrate to be disabling/incapacitating events since the patient missed many days at school (additional information was not legible). Additional information is not expected. ```PCP notes received 02/17/10 for DOS 11/24/09. Pt c/o nausea, HA and poor performance at school due to these sx. Tx of Amitriptylin relieved HA. Pt still had nausea. ```PCP notes received 02/17/10 for DOS 12/02/09. Pt referred for Pediatric GI consult. On 02/02/10, Pt c/o ongoing HA, nausea and unable "to function" and missing school. Pt's parent reported that Pt was undergoing neurological consult, bu

MedDRA PT Convulsion, Crying, Headache, Immediate post-injection reaction, Listless, Pallor, Pulse pressure decreased, Somnolence, Syncope, Thirst

Symptom Text: Initial case was reported as serious on 04-FEB-2010 by Health Authority (HA ref. NO-NOMAADVRE-FHI-2010-9852, FHI-10/325). It was reported that a 12 year old female patient suffering from DIGEORGE'S syndrome who on 25-JAN-2010 was vaccinated with the first 0.5ml dose of GARDASIL. No information on any medical treatment for DIGEORGE'S syndrome was reported. HA coded convulsion, pulse weak, syncope, facial pallor, crying, listlessness, sleepiness and thirst (causalities possible) with onset on the day of vaccination, 25-JAN-2010. Within minutes post vaccination the girl developed weak pulse, thirst, listlessness and sleepiness while crying, facial pallor, syncope and convulsion appeared already after 1 minute following vaccine administration. The outcome for pulse weak, syncope and convulsion is recovered while unknown for thirst, listlessness, crying, facial pallor and sleepiness. According to the HA, the event could possibly be consistent with a vasovagal reaction. Convulsion, pulse weak, syncope, facial pallor, listlessness, sleepiness and thirst were considered to be other important medical events by the reporter. Other business partner number included: E2010-00775. Case is closed. No further information is available.

Seriousness: HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Dizziness, Headache, Intracranial venous sinus thrombosis

Symptom Text: Case received from the Health Authorities on 04-FEB-2010 under the reference number GR-EOF91639 and received under the the reference number SPV10005: On 06-OCT-2009 a 14-year-old female patient received the second dose of GARDASIL (batch#, lot# not reported). Vaccination was performed by a paediatrician. From 02-NOV-2009, she presented with intense nascent headache and dizziness, and thrombosis of a brain venous sinuses. No relevant medical history or concomitant medications were reported. The patient was hospitalized from 04-NOV-2009 to 13-NOV-2009 after brain CT scan, the findings of which were suspect from thrombosis of venous sinuses was documented by MRI-MRV. Test for thrombophilia- vasculitis- neoplasia did not reveal any pathologic findings. The patient's condition was improved with immediate anticoagulant treatment. It was also reported that the patient was under pharmaceutical treatment with SINTROM for the next 6 months. The outcome was reported as "recovering/resolving". The Health Authorities initially received the report from a hospital physician (neurologist). The Health Authorities assessed the causal relationship between the reported reactions and vaccination as probably related. The seriousness criteria reported by the HA were "caused/prolonged hospitalization" and "life threatening". The HA coded the events "intense nascent headache", "intense nascent dizziness" and thrombosis of brain venous sinuses". Other business partner number included: E2010-00884. Additional information has been requested.

MedDRA PT Amnesia, Convulsion, Immediate post-injection reaction, Syncope

Symptom Text: Information has been received from a foreign Health Authority (case n. 111181) through local case # IT064/10. A 14 year old female was vaccinated on 01-FEB-2010 at 12:00; with the first dose of GARDASIL, (Lot # NJ37700, Batch # NK31720). On the same day, 30 seconds post-vaccination, she presented with a vasovagal syncope with convulsive crisis. The patient quickly regained her state of consciousness but did have any recollection of the event. Emergencies were called and she was sent to the ER where the diagnosis was: vasovagal syncope. The outcome was recovered on 01-FEB-2010. Both the reporter and the Health Authority considered the case as serious. To note, Health Authorities coded only syncope vasovagal and convulsive seizure. The adverse events of syncope vasovagal, convulsive seizure and amnesia transient were considered serious as other important medical events. This case was the linked case of cluster of 2 cases after GARDASIL, reported by the same physician with the same lot number NJ37700 batch number NK31720. Case linked with case E2010-00847. This case is closed. Other business partner included E2010-00846. No further information is available.

MedDRA PT Convulsion, Death, Decreased activity, Fall, Headache, Hypertension, Hypoaesthesia, Injury, Loss of control of legs, Menstruation irregular, Oedema peripheral, Paraesthesia, Peripheral coldness, Sensory loss, Sudden unexplained death in epilepsy, Unresponsive to stimuli, Weight increased

Symptom Text: Patient received the HPV as well as the flu nasal spray on Aug 25th. I first declined getting her the vaccination but her doctor ensured me that it was safe. I had declined the same vaccination a year earlier at the downtown public health center. Patient was getting ready for school and was standing by her closet, and all of a sudden she fell, she lost total control of her legs. She went to school and could not engage in any of the activities because of the numbness in her legs and the swelling of her foot. She also, started to get a really bad headache. Days later she woke up out of her sleep complaining of a severe headache, which usually she gets if she has a seizure but she hadn't had a seizure this night. She continued to say she had not feeling in her foot and tingling feeling in her leg. After I examined her foot I noticed it was swollen. The next morning I called her doctors office and made her doctors appointment for Oct 23rd. During the month of October she had irregular periods. My daughter never made it to Oct 23rd, which as also her birthday. She passed on Oct. 17th, I found her cold unresponsive in her room at 7am, which I went in to wake her up to take her morning pills. ```Neurology records received 2/24/10. Service date 8/14/09. Assessment: Frontal lobe seizures. Patient presents for follow-up visit due to recent increase in seizure activity. Significant weight gain. High blood pressure. ```PCP medical records received 2/19/10. Service dates 5/21/08 to 10/23/09. PCP notes state N/S Injury 10/23/09. Expired 10/17/09. ```Death Certificate received 3/23/10. Cause of Death: Sudden Unexpected Death in Epilepsy (SUDEP).

Other Meds: Trileptol and Keppra

Lab Data: ```LABS and DIAGNOSTICS: CBC - WBC 4.5 K/mm3 (L) Lymphocytes 44.3% (H) Monocytes 13.5% (H). ALT 43 U/L (H).

History: Patient had a pre-existing seizure disorder which she was on trileptol and Keppra to control the seizures. ```PMH: Born 36 1/2 weeks gestation. Feeding difficulties at birth. Seizures.

Prex Illness: My daughter had a seizure disorder that came on with her periods.

MedDRA PT Abasia, Activities of daily living impaired, Amenorrhoea, Asthenia, Bedridden, Decreased activity, Fatigue, Gait disturbance, Headache, Hyperhidrosis, Malaise, Muscle fatigue, Muscular weakness, Myalgia, Post viral fatigue syndrome

Symptom Text: Information was obtained on a request by the company from the agency via a Public Case Details form concerning a 16 year old female who on 08-SEP-2008 was vaccinated with a dose of GARDASIL (batch number J2896, lot number 657872/0583U). On 08-SEP-2008, after second dose of GARDASIL the patient experienced generalized muscular weakness, severe headache-could not participate in sports at school. The next 5-6 weeks the patient experienced severe and continual headaches, muscle pain and weakness to the extent that the patient had to be carried to the toilet and was bed-bound. The mother also reported that student did not menstruate at all in between her first and second dose of GARDASIL. The mother also commented that the student had noticed "that she was sweating a lot" between dose 1 and dose 2 of GARDASIL. On 03-JUN-2009 the patient was still unwell and was experiencing the same symptoms, (severe headaches, muscle fatigue, has difficulty walking due to weakness) and extreme fatigue. The patient had not been able to return to school as too unwell. The patient was hospitalized for 1 week under the care of immunologist who diagnosed the patient with "post viral fatigue". The patient had been referred to a clinic for ongoing reaction with a physiologist and psychologist. At the time of reporting on 21-SEP-2009, the patient had not recovered. The agency considered that muscular weakness, amenorrhoea, fatigue, headache and hyperhidrosis were possibly related to therapy with GARDASIL. The original reporting source was not provided. No further information is available.

Seriousness: LIFE THREATENING, SERIOUS

MedDRA PT Idiopathic thrombocytopenic purpura, Iron deficiency anaemia, Platelet destruction increased

Symptom Text: Information was obtained on request by the company from the agency via a public case details form concerning a 19 year old female patient with no significant past medical history who approximately two weeks before the onset date of the symptoms, on approximately 18-JAN-2007 was vaccinated with the second dose of GARDASIL (Lot not reported). On 01-FEB-2007 the patient experienced idiopathic thrombocytopenic purpura (ITP), antinuclear antibody positive and iron deficiency anaemia. The patient presented with iron deficiency (Hb 10.1g) and her platelet count was 35. Her bone marrow showed a picture consistent with ITP and peripheral platelet destruction. On an unspecified date, the patient's platelet count fell to 5. The patient antibody to nuclear antigens (ANA) was positive to a titer of >1280 with a speckled pattern. The rheumatoid factor was borderline at 21; the extractable nuclear antibodies (ENA) and DNA binding were negative. The patient was treated with oral corticosteroid and responded to the treatment, but the thrombocytopenia recurred when the therapy was weaned. Subsequently the patient was treated with rituximab (on clinical trial) and has remained in hematological remission. On 09-OCT-2009 the patient had recovered. The agency considered that idiopathic thrombocytopenic purpura, antinuclear antibody positive and iron deficiency anaemia were possibly related to therapy with GARDASIL. Idiopathic thrombocytopenic purpura, antinuclear antibody positive and iron deficiency anaemia were considered to be immediately life-threatening by the agency. The original reporting source was not provided. No further information is available.

Other Meds: Unknown

Lab Data: bone marrow biopsy, ITP and peripheral platelet destruction; diagnostic laboratory test, DNA binding was negative; extractable nuclear antigen ab, negative; platelet count, 35; platelet count, subsequently fell to 5; serum ANA, positive a t

Seriousness: EXTENDED HOSPITAL STAY, HOSPITALIZED, SERIOUS

MedDRA PT Drug exposure during pregnancy, Tachycardia foetal

Symptom Text: Information has been received from a health professional for GARDASIL, a Pregnancy Registry product, concerning a female baby. On 15-SEP-2006 the baby's 17 year old mother with no known allergies was vaccinated IM with the first dose of GARDASIL (lot# 653735/0688F) in the right deltoid. On 11-OCT-2006, the baby's mother had a positive urine pregnancy test. It was reported that the mother had previously had a negative serum pregnancy test on 17-JUL-2006. The mother's last menstrual period (LMP) was 15-AUG-2006. Subsequently the baby experienced fetal tachycardia. On 04-JUN-2007 the baby was delivered with no congenital anomalies by cesarean section. The baby was healthy and normal. Estimated gestational age at delivery was 38 weeks, 1 day. The reason for the cesarean section was "unrelieved pain". The mother and baby were both discharged on 11-JUN-2007. The reason for the extended hospitalization was unknown. The mother's experience has been captured in WAES 0612USA01320. The event of fetal tachycardia was previously reported in WAES 0612USA01320. Attempts to obtain additional information regarding the infant have been unsuccessful. No further information is available.

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Basal ganglia infarction, Drug abuse, Dyspnoea, Facial palsy, Gait disturbance, Hemiparesis, Hypoaesthesia, Ischaemic stroke, Rash, Sensory loss, Vasospasm

Symptom Text: Information has been received from a medical assistant concerning a 19 year old female patient with allergy to latex and sulfonamides and no medical history who on 01-FEB-2010 was vaccinated with the first 0.5 ml IM dose of GARDASIL (lot #662304/1013Y). Concomitant therapy included YASMIN. On 03-FEB-2010, the patient developed shortness of breath, numbness on the left side of body, and a rash on her chest. The patient was admitted to a medical center on 03-FEB-2010 for initial evaluation and then transferred to another hospital. A magnetic resonance imaging of the brain was performed which revealed a "mini-stroke". The medical assistant added that the physicians at that hospital did not feel the adverse events were related to GARDASIL. At the time of reporting, the patient was recovering from the adverse events. Follow up information received on 09-FEB-2010 from the medical assistant reported that the patient received no other vaccines at the time of the GARDASIL vaccination. The events were not disabling nor life threatening. It was planned that the GARDASIL series would continue. Additional information has been requested. ```2/19/10 Received hospital medical records for 2/4-2/8/2010. FINAL DX: right sided weakness & numbness secondary to ischemic stroke, specifically left basal ganglia infarct likely secondary to methamphetamine induced vasospasm. Records reveal patient experienced acute onset of right sided extremity weakness, right facial droop & numbness/decreased sensation right body. Had been transferred from outlying ER for higher level of care. Tx w/steroids & ASA. Improved. Able to transfer & ambulate short distances w/max assist of 2. Transferred to neurorehab. ```2/19/10 Received ER medical records of 2/3/2010. FINAL DX: CVA Acute onset weakness began approx 3 hr prior to ER. States had rash on chest area s/p vaccination but resolved when seen in ER. ```2/19/10 Received GYN medical records for 12/2/09-2/5/10. FINAL DX: ASCUS, HPV-DNA(+), yeast infection.

Other Meds: YASMIN

Lab Data: Magnetic resonance, 02/03/10, brain: mini-stroke ```2/19/10 Received hospital medical records w/LABS: CT head WNL. MRI brain & spine c/w acute ischemic stroke. Urine tox screen (+) methamphetamine. MRA head/neck WNL. TEE abnormal w/s

History: ```2/19/10 Received hospital medical records w/PMH: congenital cyst in neck closed at age 12. ```2/19/10 Received ER medical records w/PMH: Allergy: sulfa, latex. ```2/19/10 Received GYN medical records w/PMH: Pap smear abnormal, (+) high risk HPV. Colposcopy. Dysmenorrhea. Oral contraceptives. Smoker. Acne.

MedDRA PT Caput succedaneum, Congenital naevus, Drug exposure during pregnancy, Jaundice neonatal, Ocular icterus, Strabismus

Symptom Text: Information has been received from a physician via medical records concerning a male infant whose 25 year old mother with a history of 1 pregnancy and 1 live birth who was vaccinated IM with a first 0.5 ml dose of GARDASIL. The physician believed that the vaccine was given two weeks before the mother found out she was pregnant. Her LMP was 28-FEB-2009 (estimated delivery date was 05-DEC-2009). Ultrasound performed on 31-JUL-2009 showed normal result. On 24-NOV-2009 the mother was admitted for delivery. On 25-NOV-2009, at 08:20, the mother delivered a normal male neonate via spontaneous vaginal delivery. The baby's birth weight was 7 pounds and 14.25 ounces, length was 20 inches, chest circulation was 13.25 and head circulation was 13.5. The Apgar score was 9 at 1 minute and 9 at 5 minutes. The baby passed the hearing screen. Physical examination showed Mongolian spots sacrum, mild caput molding, positive bilateral retinal reflex, regulator rhythm and rate, no murmur, descended testes and no hip dislocate. On 26-NOV-2009 the mother and the baby were discharged from the hospital and discharge examination showed the baby had jaundice face. On 30-NOV-2009 the baby was seen for a newborn check. The baby had breast feeding, using Similac formula with iron. Physical examination showed skin jaundice (to xiphoid) and slight icteric in eyes. The assessment was healthy newborn and continued the current feeding regimen. On 22-DEC-2009 the baby was seen for a well child visit. Baby's father complained of possible cross eyed of the baby. Physical examination showed no significant strabismus. The doctor's assessment was normal occasionally strabismus and expected resolution over the next few months. On 26-JAN-2010 the baby was seen for a well child visit and physical examination revealed no abnormalities. The doctor's assessment was healthy 2 month old male baby. At the visit, the baby received the first dose of PED/ADOL-PRESERV FREE, pneumococcal and rotavirus, pentavalent RV5. Mongolian spots sacrum was considered a congenita

MedDRA PT Convulsion, Memory impairment, Syncope, Trismus

Symptom Text: Information has been received from a Health Authority (case No. 111185) through (local case No. IT065/10). Initial report received on 05-FEB-2010. This case is the linked case of a cluster of 2 cases after GARDASIL vaccination, reported by the same physician with the same lot #NJ37700 and batch #NK31720. An 11 year old female with no previous medical history, was vaccinated on 01-FEB-2010 at 12:35 pm, with the first dose of GARDASIL vaccine (lot # NJ37700 and batch # NK31720). On the same day, 30-40 seconds post-vaccination, she presented with a vasovagal syncope with convulsive crisis and facial trismus. The patient quickly regained her state of consciousness but did not have any recollection of the event. Emergencies were called and she was sent to the ER where the diagnosis was: vasovagal syncope. The final outcome was not reported. The seriousness of the event was not defined by either the reporter or the HA. To note, Health Authorities coded syncope vasovagal, convulsive seizure and trismus. Upon internal review, syncope vasovagal, convulsive seizure and trismus were determined to be an other important medical event. The case is closed. Other business partner number included E2010-00847. No further information is available.

MedDRA PT Chronic fatigue syndrome, Inappropriate schedule of drug administration, Injection site mass, Injection site pruritus, Injection site swelling

Symptom Text: Information was obtained on a request by the Company from the agency via a Public Case Detail concerning a 34 year old female patient who on 31-JUL-2007 and on 21-DEC-2007 was vaccinated with a dose of GARDASIL (route and lot # unknown) respectively. It was reported that in December 2007, the patient experienced permanent itching and swelling at the site of injection. It was reported as a lump under the skin that increased in size when she scratched it. It was reported that in march 2008, the patient presented the symptoms of Chronic Fatigue Syndrome and she was officially diagnosed by 2 different specialists in October 2008 after diagnosis by elimination. It was reported that there was no treatment from Chronic Fatigue Syndrome and that a cortisone cream for injection site was prescribed to try stopping itching but it did not work. It was reported that by September 2009 all the symptoms were still active. The reporter felt that chronic fatigue syndrome and injection site reaction were possibly related to therapy with GARDASIL. Chronic Fatigue Syndrome and injection site reaction were considered to be disabling. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Blindness, Dysarthria

Symptom Text: This case is linked with case E2010-00923 (WAES#1002USA02408) (same patient, same product, different doses). Information has been received from the Foreign Health Authorities (Ref: ES-AGEMED-707202240) concerning a 15 year old female patient who on 21-JAN-2009 was vaccinated with the second dose of GARDASIL (batch number not reported, site of administration not reported) by intramuscular route. It was reported that on the same day of vaccine administration, 21-JAN-2009, the patient presented with dysarthria and loss of vision. The patient recovered on the same date, 21-JAN-2009. It was reported that the patient suffered from cephalea since the administration of the first dose of GARDASIL (batch number, date, route and site of administration not reported) (case E2010-00923) (WAES#1002USA02408). The patient did not want to receive the third dose of vaccine due to adverse events. No further information was given. Case reported serious by the health authorities with other medically important condition as criteria. Case is closed. Other business partner number include E2010-00922.

MedDRA PT Type 1 diabetes mellitus

Symptom Text: Information has been received from a physician concerning a 25 year old female patient with no relevant history reported, who "approximately 3 years before the report", in approximately 2007, was vaccinated with the first dose of GARDASIL (route and lot # unknown). Subsequently, on an unspecified date, the patient experienced type 1 diabetes. The remaining doses were not administered by the reporting physician, who considered that the event was related to vaccination. The outcome was not reported. Type 1 diabetes mellitus was considered to be an other important medical event by the physician. Other business partner numbers include E2010-00973. No further information is available.

MedDRA PT Convulsion, Syncope

Symptom Text: Information has been received from a physician concerning a 13 year old female who in approximately 2010, "recently", was vaccinated with the second dose of GARDASIL 0.5 ml (route and lot # not reported). On the following evening during a basketball game, the patient had a syncope episode and the coach diagnosed it as seizure. The patient was taken to emergency room but not hospitalized. It was reported that the patient's event was improved subsequently but the final outcome was unknown. All attempts to obtain follow up information has been unsuccessful. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Haemorrhage, Inappropriate schedule of drug administration, Placental disorder

Symptom Text: Information has been received from a Nurse Practitioner, for the pregnancy registry for GARDASIL, concerning a 27 year old female patient, with depression, anaemia and allergy to CECLOR, BENADRYL, and ADVIL, who on 01-SEP-2009 was vaccinated with the first dose of GARDASIL (route and lot number not provided). Concomitant therapy included influenza virus vaccine (unspecified) and H1N1. On 01-SEP-2009, an urine pregnancy test was performed and was negative. The Nurse Practitioner stated that patient went to her office for urine pregnancy test on 12-OCT-2009 and it was positive. Early ultrasound performed on 14-OCT-2009, showed patient was 9.4 weeks pregnant at that time with an expected delivery date on 16-MAY-2010. On 12-FEB-2010 the patient, who was 27 weeks pregnant at that time, was hospitalized overnight, with bleeding which nurse practitioner stated was caused by a low lying placenta. The patient was treated with betamethasone (manufacturer unspecified) and released the next day. Bleeding issue was resolved. Additional information has been requested.

MedDRA PT Abdominal pain, Anxiety, Aphthous stomatitis, Asthenia, Ear pain, Fatigue, Headache, Nasopharyngitis, Oropharyngeal pain, Pain in extremity, Pharyngeal erythema, Pharyngitis, Pyrexia, Tonsillar disorder, Upper respiratory tract infection

Symptom Text: Information has been received from a consumer (mother of the patient) on 11-FEB-2010. It was reported that a 14 year old female patient was vaccinated with a third dose of GARDASIL (Lot # 1482U, Batch # NG09920) IM, into the upper arm on 20-MAY-2008. According to the mother, the patient developed fever, headache and pain in the injected arm the same day and recovered. Since a few weeks post vaccination, the patient experienced relapsing asthenia, common colds, fever, lassitude and "anxiety states" every 2 to 3 weeks. Clinical investigation showed no pathological findings, tropical diseases were ruled out. At the time or reporting, symptoms were ongoing. The family physician was contact by phone. He pointed out that he didn't see a causal relation to the vaccination. However on request he sent reports on findings from the OPDs of rheumatologic department and the department for tropical medicine. On 12-May-2009 and 16-JUN-2009 the patient presented at a rheumatological/immunological outpatient department. Medical history included relapsing fever up to 39 degrees C since February 2009 (in contrast to the information about onset given by the mother) bi weekly. Initially the fever had been associated to upper respiratory tract infections which stopped within an unspecified time . Fever lasted for 3 days each time. No previous relapsing infection nor further complaints, no arthralgia nor signs for arthritis, no diarrhea in patient's and patient's family history. The physical examination was normal. Blood count, CRP, hepatic and renal values, IgG and IgG subtypes and clinical chemistry were normal expect for marginal decreased ferritin (9.7 ng/ml). Anti-nuclear antibodies showed negative results. Values for EPSTEIN BARR VCA IgG antibodies 321 U/ml, EPSTEIN BARR VCA IgM antibodies <20.0 U/ml indicated a recent EBV infection but no evidence for a new primary infection. Cytomegalovirus IgM antibodies <15 U/m, Parvovirus B19 IgM antibodies 0.2 (reference region < 0.9). All examinations showed no evidence for "periodic feve

MedDRA PT Injection site swelling, Pyrexia, Vomiting

Symptom Text: Information has been obtained on request by the company from the agency via public case details form concerning a 21 year old female who on 04-AUG-2009 was vaccinated with the third dose of GARDASIL. The patient experienced massive local swelling at the injection site, intense fever and vomiting on the afternoon of receiving the third dose of GARDASIL. Two days after injection the patient was admitted to hospital and commenced on IV antibiotics. The patient was discharged two days later. The treating physician believed that there was a reasonable possibility that the events were related to the GARDASIL vaccine. The patient's outcome was unknown. The original reporting source was not reported. Additional information has been requested.

MedDRA PT Dizziness, Immediate post-injection reaction, Loss of consciousness, Muscle tightness

Symptom Text: Client in HD for vaccinations administered TDAP and Hep a in LD and HPV and MENACTRA in RD. Immediately after administration of HPV (last vaccine) client c/o feeling dizzy and then passed out. Her legs and arms constricted for about 30 seconds the client started coming back around. Father was positioned behind client and supported her head and upper body while I attempted to elevate head, provide cool cloths and request assistance from staff. Client was provided a coke and gradually resumed her pre shot color. After the incident which lasted about 15 minutes, the family advised us that this occurrence has happened once when she gave blood once when she had her ears pierced and once when she had her navel pierced.

MedDRA PT Cerebral haemorrhage, Dizziness, Educational problem, Inappropriate schedule of drug administration, Nervous system disorder, Neurosurgery, Tic

Symptom Text: Information has been obtained on request by the company from the agency via public case details form concerning a 14 year old patient who on 26-MAY-2008 was vaccinated with her second dose of GARDASIL. Three months after the second dose of GARDASIL, the patient developed dizziness and a cerebral bleed. It was also reported that the patient underwent emergency neurosurgery and was admitted to brain injury unit. There was a neurological deficit, facial tic and poor school performance after neurosurgery. It was also mentioned that 3 month for onset of cerebral bleed post vaccination was difficult to explain plus patient was given the third dose of GARDASIL 10 months after the second dose in approximately 26-MAR-2009 with apparently no adverse event. (Schedule of vaccination was not followed). At the time of the report the patient had not recovered. The reporting source considered the vaccination with GARDASIL to be possibly related to the cerebral haemorrhage and dizziness. This is an amended report. Serious criteria for cerebral hemorrhage was changed from no to yes for hospitalization. Narrative statement was changed from "went to the emergency neurosurgery brain injury unit" to "underwent emergency neurosurgery and was admitted to the brain injury unit". The primary reporting source was not provided. Additional information has been requested.

MedDRA PT Condition aggravated, Drug exposure during pregnancy, Hypertension, Induced labour, Pre-eclampsia

Symptom Text: Information has been received from a nurse practitioner for the Pregnancy Registry for GARDASIL concerning a 19 year old female patient with hypertension, asthma and obesity, no drug reactions/allergies, who on 23-JUL-2008 was vaccinated with the first dose of GARDASIL. Concomitant therapy included lisinopril (manufacturer unknown) and montelukast sodium. On 16-OCT-2008, the patient was vaccinated with the second dose of GARDASIL (Lot # 660620/0571X) and was pregnant. The patient was due for the third dose on 21-JAN-2009 but did not receive it due to her pregnancy. The patient had a prenatal panel (normal). The patient came in for an OB visit. Her LMP was on 30-SEP-2008 and her EDD was 07-JUL-2009. Follow-up information was received from a staff person at nurse practitioner's office. It was reported that the patient was induced secondary to developing hypertension, and she had a vaginal birth on 24-JUN-2009 at term. The patient was seen in the office on 02-JUL-2009 for evaluation of her blood pressure and was treated with medication (unspecified) for hypertension by one of the physicians at that visit. The patient returned for further evaluation on 07-JUL-2009 and it was noted in the chart that both the mother and her baby were both doing well. The patient was last seen on 10-AUG-2009 by another physician in the practice for her postpartum visit and there was no indication of any problems for mother or baby. Follow up information has been received from the nurse practitioner that reported that the 19 year old female patient with chronic hypertension and with superimposed pre-eclampsia in her pregnancy was induced. On 24-JUN-2009, the patient was admitted to the hospital and was induced; the patient had a vaginal delivery of a healthy baby. There were no adverse events for the baby. On 28-JUN-2009 the patient and her baby were discharged to home. It was noted that on 09-JUL-2010 chart note, the baby was nursing well and that the baby was doing well. The nurse practitioner stated that "everything looked fine". Addi

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Depressed level of consciousness, Disturbance in attention, Dyspnoea, Headache, Malaise, Nausea, Nuchal rigidity, Pain, Serology test, Staring, Tremor, Vertigo

Symptom Text: Information has been received from a physician's wife concerning her 16 year old daughter with no relevant medical history, who received the first dose of GARDASIL (Lot# and Batch# not reported) on 22-DEC-2009. On 03-FEB-2010, she experienced malaise with nausea, vertigo, breathing difficulties; she was conscious but with an absent look, feebly responding. She also had tremor, headache but no fever. She was seen at the emergency care unit on 03-FEB-2010: examination was unremarkable, CT scan was normal. Since 03-FEB-2010, the patient experienced another 9 episodes of malaise with nuchal stiffness and pain, tremor, increased headache, and loss of vigilance. Such episodes were increasingly frequent. On 05-FEB-2010, MRI was normal. Lumbar puncture performed "on Monday" (i.e. 08-FEB-2010 or 15-FEB-2010) was unremarkable. Serology test were awaited. Headaches were described as continuous even between episodes of malaise, and did not regress on paracetamol or BI-PROFENID. On 15-FEB-2010, the patient was seen by a neurologist who did not know the diagnosis nor the cause of the patient's disorder. When asked by the patient's parents, the neurologist did not know whether the events were linked to vaccination with GARDASIL but could not rule it out either. At the time of reporting, the patient had not recovered. Other business partner numbers included E2010-01027. No further information is available.

Other Meds: Unknown

Lab Data: spinal tap, ??Feb10, lumbar puncture was unremarkable; computed axial tomography, 03Feb10, CT scan was normal; physical examination, 03Feb10, pt. seen at emergency care unit: examination unremarkable; magnetic resonance imaging, 05Feb10, MR

Seriousness: LIFE THREATENING, SERIOUS

MedDRA PT Hypertonia, Incontinence, Loss of consciousness, No reaction on previous exposure to drug, Trismus

Symptom Text: Information has been received from a Health Authority (case n. 111894) through (local case n. IT076/10), concerning a 13 year old female with a remote medical history positive for palatoschisis corrected surgically at the age of 8 months and with recurrent otitis, who on 11-FEB-2010 at 11:00 am, was vaccinated with the first dose of GARDASIL (batch # NG17850, lot # 0465U). On 12-FEB-2010, about 36 hours post-vaccination, she presented with a critical episode during sleep with loss of consciousness, sphincteric discharge, hypertonus and trismus that lasted about 10 minutes. The outcome is recovered. The patient did not present with adverse events after previous vaccinations. The case is closed. Loss of consciousness, incontinence, hypertonus and trismus were considered to be immediately life-threatening. Lot check has been initiated. Other business partner numbers include E2010-01023. No further information is available.

MedDRA PT Dermatomyositis, Inappropriate schedule of drug administration

Symptom Text: Information was obtained on a request by the Company from the agency via a Public Case Detail concerning a 39 year old female who on 09-SEP-2009 was vaccinated with a dose of GARDASIL vaccine intramuscularly. Concomitant therapy included norethindrone and VENTOLIN. On 25-SEP-2009 the patient experienced dermatomyositis and was hospitalized. Lab data: CK 1657 after one week high dose steroid; on 16-OCT-2009, neutrophilia, eosinophilia just over upper Limit of Normal (wbc11.5), rheumatoid factor 1050iu/ml (n0-14); anti nuclear antibody, homogeneous pattern 1:160; erythrocyte sedimentation rate 20mm. Other lab investigations included high CK 2000, rheumatoid factor 1000 and pos "anf". The patient was treated with prednisone. The outcome was unknown. The reporter felt that dermatomyositis was possibly related to therapy with GARDASIL vaccine. Dermatomyositis was considered to be disabling. The original reporting source was not provided. Additional information is not expected.

Other Meds: VENTOLIN; norethindrone

Lab Data: Diagnostic laboratory test, anti nuclear antibody, homogeneous pattern 1:160; WBC count, 16Oct09, 11.5; eosinophil count, 16Oct09, just over Upper Limit of Normal; neutrophil count, 16Oct09, just over Upper Limit of Normal; serum creatine k

MedDRA PT Dizziness, Nausea, Paraesthesia, Urticaria

Symptom Text: Information has been received from a physician and a licensed practical nurse concerning a 14 year old female patient with attention deficit disorder and allergic to penicillin who on 25-FEB-2009 was IM vaccinated with a first dose of GARDASIL (lot no. 662529/1317Y) given in left upper thigh; a dose of VAQTA (lot no 666201/1538Y) given in right upper thigh; a dose of MENACTRA (lot # 430800AA) given in left lower thigh and a dose of ADACEL (lot # C3352AA) given in right lower thigh. Concomitant medication included ADDERALL. It was reported that the patient called the physician's office at the afternoon, the patient experienced hives, nausea and dizziness and also complained of tingling in both legs. Patient had taken 12.5 mg of BENADRYL twice before going to the emergency room. The patient was seen at approximately 23:00 PM the same day and symptoms were gone. Patient received a dose of SOLU MEDROL IV and ZANTAC prior to being discharged from emergency room. At the time of report the patient was recovered. Upon internal review, hives, nausea, dizziness and tingling in both legs were considered to be other important medical events. No further information is available.

MedDRA PT Abdominal pain, Anaphylactic reaction, Chest discomfort, Cold sweat, Erythema, Pallor, Paraesthesia, Rash, Rash macular

Symptom Text: Information was obtained on request by the company from the agency via a public case details form concerning a 12 year old female patient who on 12-OCT-2009 at 10:20 am was vaccinated with a dose of GARDASIL (Lot#NJ29430, batch #NK20450) and also was vaccinated with a dose of RECOMBIVAX HB, (Lot#1422U, batch# NJ11300). On 12-OCT-2009, at 10:35 the patient developed a rash to chest (blotchy and raised edges) and a red rashy face. The patient also complained of heavy chest. Then at 10:40 am, the patient experienced sore abdomen, pins and needles to hands, heavy chest, rash to chest subsiding, pale skin and hands clammy. It was noted that the patient did not have respiratory problems and that the patient was alert. An ambulance was called and the patient was treated with ADRENALINE. This event required that the patient was treated in the accident emergency department and caused or prolonged inpatient hospitalization (dates not reported). At a subsequent clinic visit this ADR was upgraded to anaphylaxis. At the time of the reporting, the outcome of the patient was unknown. The agency considered that hypersensitivity, rash and anaphylactic reaction were possibly related to therapy with GARDASIL and RECOMBIVAX HB. The original source was not provided. No further information is available.

MedDRA PT Congenital naevus, Constipation, Diarrhoea, Drug exposure during pregnancy, Faeces discoloured, Haemangioma, Jaundice neonatal, Pyrexia, Rash macular, Rhinitis, Rhinorrhoea, Skin hyperpigmentation, Upper respiratory tract congestion

Symptom Text: Information has been received from a physician via medical records concerning an 8 day old female patient with no known drug allergies, who was born to a 22 year old female patient with left ovarian cyst history and no drug reactions or allergies who in September 2008, was vaccinated with a first dose GARDASIL (lot # not reported). On 02-MAR-2009 she received the third dose of GARDASIL (lot # not reported). After she received three doses of vaccine she was found out that she was pregnant. Patient had last menstrual period on 13-FEB-2009. It was reported that the mother had a normal pregnancy. On 11-NOV-2009, with no complication during labor/delivery at 38 weeks from last menstrual period she had a normal female baby which was born via vaginal delivery. The baby was slightly yellow in the hospital, but all values were within normal limits. The baby weight was 6 lb and 0 ounce, length 19 inches and apgar score 9/9. On 19-NOV-2009, the 8 day old patient presented to the physician's office for an outpatient's visit with congestion and a yellow drainage from her nose that began 3 days ago, on 16-NOV-2009. Review of systems were normal except that the patient was positive for jaundice in her face to her chest, that it seems to was improving by her mother. During the nasal septum/mucosa test was found that was partially obscured by purulent drainage. The patient had normal respiratory rate and pattern with no distress, normal breath sounds with no rales, rhonchi, wheezes or rubs. On the same day a Flu test and a RSV were performed and the results were negative. The physician's assessment was nasal congestion. The physician's order's included: Radiology/test: Non invasive ear or pulse oximetry for oxygen saturation; single determination; A RSV antigen EIA and influenza A or B: antigen detection by enzyme immunoassay (X2). No prescriptions were generated, provider does have access to a qualified e-prescribing system. The physician's recommendations included: humidifier/vaporizer, bulb suction and nasal saline, and monito

Other Meds:

Lab Data: Serum influenza A virus, 11/19/09, negative; nasal aspirate RSV, 11/19/09, negative; Apgar score, 11/11/09, 9/9; serum influenza B virus, 11/19/09, negative

History: Ovarian cyst

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abdominal pain upper, Dizziness, Headache, Muscle contractions involuntary, Muscle spasms, Muscle twitching, Palpitations, Pyrexia

Symptom Text: Information has been received by the health authority (HA ref. NO-NOMAADVRE-FHI-2010-9949/FHI 10-4501). It was reported that a 12 year old girl was vaccinated with the second dose of GARDASIL batch # "NK4587" (one figure missing), parenteral route 0.5 ml) on 13-JAN-2010. The health authority coded dizziness, fever, pain stomach, cramps legs and headache (causalities possible) with onset on 15-JAN-2010 and fasciculation (causality possible) with onset in January 2010. (HA stated 16-JAN-2010 or 26-JAN-2010. Two separate reports, different information (from family doctor and policlinics). The duration of fever an stomach pain was four days, while the dizziness, leg cramps and headache lasted for an unspecified number of days. The fasciculation's, located to legs, thighs and upper extremities, were still not recovered at time of reporting. Tests performed on 08-FEB-2010: pulse rate 77, blood pressure 117/67, arterial blood oxygen saturation test 100%, and neurological examination (no special findings). The reporter summarized the test results: several examinations were carried out policlinical. The only finding was small twitches in both lower extremities, by palpitations and tonus examinations. At the time there was no fasciculation's. No more information on the tests was provided in the report. According to the report the girl was referred to magnetic resonance (MR) caput and EEG and was to be followed up at the policlinic. FHI has asked for further information from the policlinic. The outcome is recovered for all but the fasciculation that was still not recovered as to be the lower extremities on 08-FEB-2010. This case was closed. The reporter felt that the events were considered to be Other Important Medical Events. Other business partner number included: E2010-01059. No further information is available.

Other Meds: Unknown

Lab Data: Pulse oximetry, 08Feb10, 77; Blood pressure measurement, 08Feb10, 117/67; Neurological examination, 08Feb10, No special findings; Arterial blood O2 saturation, 08Feb10, 100%

MedDRA PT General physical health deterioration, General symptom, Infection, Pyrexia, Sepsis

Symptom Text: Case received from a Health Authority on 17-FEB-2010 under reference # 2010-04050. A 15 (also reported as 16) years old female patient received on 07-OCT-2009 the first dose of GARDASIL (batch # NH55610, lot #1693U, site of administration not reported) via intramuscular route. On 08-OCT-2009, one day post vaccination, the patient developed fever and exhibited signs of sepsis. The patient was hospitalized on 08-OCT-2009 in a reduced general condition. Her body temperature at admission was 38 C after taking paracetamol (dose not known). Blind treatment with CO-AMOXI-MEPHA was started for an unclear focus of infection. On 08-OCT-2009, C-reactive protein (CRP) result 132. On 09-OCT-2009, CRP result 150. The patient was discharged on 10-OCT-2009. At the time of the report, the patient was being treated by her general practitioner for diffuse general symptoms that were not described more closely. The health authority assessed the causal relationship to the vaccine as possible. No further information was available. Other business partner numbers include E2010-01072.

MedDRA PT Apnoea, Back pain, Dizziness, Fall, Head injury, Immediate post-injection reaction, Muscle rigidity, Nausea, Presyncope, Trismus

Symptom Text: Information has been received from a physician concerning a 12 year old female who on 13-OCT-2008 was vaccinated with first dose of GARDASIL. On 20-FEB-2010, the patient was vaccinated with a dose of GARDASIL (dose and route not reported, lot number 1353X, batch number NL24560). There was no concomitant medication. On 20-FEB-2010, immediately after vaccination, the patient experienced vaso-vagal. It was noted that the patient felt light headedness, nausea and giddiness. She lied down for 2 minutes and after getting up, she felt dizzy and fell down. Her body became contorted and she fell down banging her head. The patient had lock jaw and for some time her breathing stopped. She was given painful stimuli and she regained consciousness after two minutes. Her breathing was normal. She complained of severe backache. No prescription drug treatment was given for this event. Dizziness/lightheadedness, vaso-vagal, lock jaw, body rigidity, stop breathing for a while, fell down banging her head, complained of severe backache and nausea were considered to be immediately life-threatening. A lot check has been initiated. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Diagnostic procedure, Laboratory test, Muscular weakness, Myalgia, Pain in extremity, Syncope

Symptom Text: Information has been received from a office manager concerning a 13 year old female patient with no known drug reactions or allergies and no pertinent medical history noted who on an unspecified date, was intramuscularly vaccinated with the third dose of GARDASIL. There were no known concomitant medications. The office manager reported that approximately one year after she completed the GARDASIL series the patient complained of generalized muscle weakness, muscle and leg pain and syncope. It was reported that various lab and diagnostic studies were performed. The patient was seen by a cardiologist but the office manager did not know the exact labs and studies performed. The patient sought medical attention by visiting the doctor's office. The office manager stated that the patient was still being followed up by different physicians. At the time of the report, the office manager did not know whether the patient's symptoms had resolved. Generalized muscle weakness, muscle and leg pain and syncope were considered to be other important medical events by the office manager. Additional information has been requested.

MedDRA PT Cervix disorder, Drug exposure during pregnancy, Foetal disorder, Ultrasound scan abnormal

Symptom Text: Information has been received from an office manager concerning an infant whose 21 year old mother with a history of pyloric stenosis, papanicolaou smear abnormal, ovarian cysts, prior loop electrosurgical excision procedure, pre-term delivery (35 weeks) with pre-eclampsia and pre-term premature rupture of membranes with her prior pregnancy who on 26-JUN-2008 and 29-SEP-2008 was vaccinated intramuscularly in the right deltoid with a first and second 0.5 ml doses, respectively, of GARDASIL (Lot # of the second dose: 0573X). There was no birth defect in previous pregnancy. There was no concomitant medication. Subsequently the patient became pregnant. The patient was seen at the practice. On 14-OCT-2008, the patient was 5-6 weeks gestation. Estimated date of delivery was approximately 09-JUN-2009. On 20-OCT-2008 an ultrasound revealed that the fetal heart rate was 124 bpm and the cervix was 3 cm. The office manager reported that they did not have any information on the infant, and she did not call the patient concerning this registry. There was a note written at postpartum visit that the infant was seeing a cardiologist for heart valve. Heart valve disease was considered to be congenital anomaly. The mother's experience is reported in WAES #0810USA02447. Additional information has been requested.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician for GARDASIL, a Pregnancy Registry product, concerning a 15 year old female with no medical history or allergies who on 18-MAY-2009 was vaccinated intramuscularly with the first and only dose of GARDASIL while pregnant (LMP=end of April 2009, EDD=04-Feb-2010). Concomitant therapy included LUPRON, ROCEPHIN, azithromycin and FLAGYL. No adverse effect reported. Laboratory tests included positive pregnancy test. Medical attention was sought. Follow-up information was received from the physician for GARDASIL, a Pregnancy Registry product, concerning the 15 year old female with post-traumatic stress disorder and conversion disorder. Concomitant therapy included LUPRON, from 18-MAY-2009, 11.25 mg, "93mis" for the menstrual supplement, ROCEPHIN, from 18-MAY-2009, 125 mg, "XT", for "SII tx/presumptive tx", azithromycin, from 18-MAY-2009, 1 gm, "XT", for "SII tx/presumptive tx", and FLAGYL, from 18-MAY-2009, 2 gm, "XT", for the treatment of trichomonas. Estimated conception date is 02-MAY-2009. The patient underwent elective termination on an unknown date within 6 weeks from LMP. Upon internal review, the patient's elective termination was considered to be an other important medical event. Additional information is not available.

MedDRA PT Anxiety, Asthenia, Dizziness, Headache, Nausea, Pain, Palpitations, Sensory loss, Thirst, Vision blurred, Weight bearing difficulty

Symptom Text: Information was obtained on a request by the Company from the agency via a Public Case Detail concerning a female who on 26-MAY-2009 was vaccinated intramuscularly 1 dose, 1 time with GARDASIL. On an unspecified date, the patient experienced weight bearing difficulty, anxiety, asthenia, dizziness, headache, nausea, thirst and vision blurred and was hospitalized. The patient was unable to weightbear/needing assistance for 1/52. The patient also had weakness, body aches, headaches, nausea, anxiety, decreased sensation in legs, increased thirst, dizzy, blurred vision and palpitations. All the events required a visit to the doctor. At this time, the patient did not recover from the events. The reporter felt that weight bearing difficulty, anxiety, asthenia, dizziness, headache, nausea, thirst and vision blurred were possibly related to therapy with GARDASIL. The original reporting source was not provided.

MedDRA PT Fall, Hyperhidrosis, Immediate post-injection reaction, Loss of consciousness, Pain in extremity, Pallor

Symptom Text: Child was given HPV #2 at 8:15 AM in the left deltoid. Then Varicella was given in the left SQ. We then moved to the right arm where the MCV4 was given in the right deltoid. Immediately after MCV4 was given, child closed her eyes and complained of pain to the right arm and then fell to the side, passing out. She was pale and sweaty and came to in about 1 minute. She was awake and alert and responsive stating "cool, I have never passed out before". We had her lay down for 20 minutes with her feet elevated and gave her hard candy and water to drink. She did not have breakfast before coming to the clinic.

MedDRA PT Abasia, Arthralgia, Back pain, Balance disorder, Dizziness, Headache, Joint swelling, Malaise, Migraine, Musculoskeletal chest pain, Neck pain, Pain in extremity, Paraesthesia, Peripheral coldness, Similar reaction on previous exposure to drug, Wheelchair user

Symptom Text: Information was obtained on request by the company from the agency via a public case details form concerning a 12 year old female who on 06-MAR-2008 was vaccinated with first dose of GARDASIL (lot # not reported). On an unspecified date she received second dose (lot # not reported). On 11-SEP-2008 she received third dose of GARDASIL (lot # not reported). On 06-MAR-2008 after first injection she started feeling unwell with a minor headaches. After second injection she experienced severe headaches consistent, progressing to severe intense migraines, neck and back pain, pins and needles in hands, face and dizzy spells and loss of balance. After third injection she experienced leg and back pain (wheelchair was needed as unable to walk unaided), migraine, back, leg and neck worse and rid pain. Four days after last injection she experienced foot pain sore ankle with swelling, pins and needles, foot cold and unable to walk properly. The patient was treated with PANADEINE FORTE, diazepam, MOBIC, physiotherapy, endeplo and NAPROSYN SR 750. At the time on the report the patient had not recovered from headache, abasia, balance disorder, dizziness, migraine and paraesthesia. The agency considered that headache, abasia, balance disorder, dizziness, migraine and paraesthesia were possible related to therapy with GARDASIL. The original reporting source was not provided. Follow up information has been received from agency who considered the events of leg pain and back pain (wheelchair was needed to walk unaided) to be incapacitating/disabling. No further information is available.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Congenital anomaly, Drug exposure during pregnancy, Pneumothorax, Polydactyly, Premature baby, Renal cyst, Respiratory distress, Weight decrease neonatal

Symptom Text: Information has been received from a certified nurse midwife concerning a male patient who was exposed through his mother who on 22-APR-2008, was vaccinated with her first dose of GARDASIL vaccine (Lot#659441/1446U) a pregnancy registry product. On 22-JUL-2009 his mother was vaccinated with her second dose of GARDASIL vaccine (Lot#662404/0312Y), along with a hepatitis A vaccine (inactive) (manufacturer unknown). Concomitant therapy included vitamins (unspecified) and iron (unspecified). On 30-DEC-2009, at 35 weeks of gestation, the patient's mother experienced a preterm delivery. The baby was a normal male baby (weight 5 pounds 15 ounces, the head circumference was 33.5 cm, the length was 19 inches, the apgar score was 4/8). The baby did not presented congenital anomalies. It was reported that the baby also experienced cysts on kidneys and respiratory distress after delivery. The baby's outcome for cyst on kidneys and respiratory distress were unspecified. Additional information has been received from a physician via medical records concerning a male baby who on 30-DEC-2009 received the first dose of hepatitis B vaccine, recom (manufacturer unknown). The patient lives with his mother, who is 16 years old and her mother in a house with a small dog and kitten. His family history was remarkable for maternal cousin who died of SIDS at 10 weeks of age. No deafness before the age of five. No hip disorders. No kidney disorders. No bleeding disorders. No heart disease. On 31-DEC-2009, the patient's chest X-ray showed improving of the radiographic appearance of the chest. The persistent parenchymal density could indicate a degree of respiratory distress syndrome. On 01-JAN-2010, the patient's chest X-ray showed a continued improvement of the radiographic appearance of the chest with some persistent hazy opacity in both lungs, which may indicate a mild degree of respiratory distress syndrome. On 07-JAN-2010, the patient was taken to a physician for a newborn visit, the patient was seven days old and was born at 37weeks via

Other Meds: Iron (unspecified), mg; Vitamins (unspecified)

Lab Data: Chest X-ray, 12/31/09, improving radiographic appearance of the chest; Chest X-ray, 01/01/10, continued improvement of the radiographic appearance of the chest; Apgar score, 12/30/09, 4.8

MedDRA PT Acarodermatitis, Dermatitis, Eczema, Hypospadias, Impetigo, Leukopenia, Purulence, Rash erythematous, Rash papular, Scab, Staphylococcal infection

Symptom Text: Information has been received from a physician via pediatric medical records concerning a male baby with no known drug allergies whose mother with scabies was vaccinated on approximately 17-Aug-2008 with a first dose of GARDASIL. The patient's mother received a 0.5 mL third dose of GARDASIL while she was pregnant. On 27-Oct-2009, the patient was born with a weight of weight 7 pounds and a length of 20 inches. On 29-Oct-2009, the patient was vaccinated with HEP B. On 02-Nov-2009, the patient was seen for evaluation. The patient was receiving enteral nutrition 4gQ4H. Physical examination was normal except for pharynx which had white plaques and of genitals which had a left hypospadias. It was noted that the patient's mother was not a smoker and the patient's father was in prison. The infant was prescribed nystatin suppository for the white plaques in the pharynx. On 23-Nov-2009, at 1 month of age, the patient was seen again. This time, the physical examination was normal except for genitals. Hypospadias was noted again. The infant's skin was reported as abnormal described as Staph dermatitis. The plan was to continue the nystatin and BACTROBAM ointment. On 01-Dec-2009, the patient was seen for his rash. It was noted that the skin had a red, crusted yellow raised area papules to back and red raise dry papules to face. During this appointment, the patient was diagnosed with dermatitis. The patient's impetigo / and staphylococcal dermatitis was still present and the infant was to continue the BACTROBAM. The patient was scheduled to return to the office one week later. On the visit of 08-Dec-2009, the patient's rash persisted. He was diagnosed with scratchy purulent crust on trunk and back. The patient was diagnosed with scabies. The patient was prescribed ELOMET. On 22-Dec-2009, the patient had another office visit. The physical examination was normal except for the genitals, skin and the abdomen (hiatal hernia was found). On this day the infant was vaccinated with his second dose of ENGERIX-B, PENTACEL and PREVNAR. O

Symptom Text: Information has been received from an office Manager concerning a 15 year old female with asthma and bronchitis, and a history of upper gastrointestinal pain and reflux, and no known allergies, who on 26-NOV-2007 was vaccinated with the first standard dose of GARDASIL, IM. The vaccination dates of the second dose and the third dose were not reported. Concomitant therapy included montelukast sodium, albuterol and PREVACID. In August 2008, after completing the GARDASIL series the patient experienced general muscle weakness, muscle pain, leg pain, leg swelling and syncope. The patient had difficulty walking due to the leg swelling. She sought medical attention via office visit. The patient was hospitalized, but reporter did not know how long the patient was hospitalized. Lab and Diagnostic Studies were done but the Office worker did not know exactly what studies were completed. Patient was seen by Cardiology and Neurology Specialist for intervention to to prevent serious criteria and all findings so far were negative. It was reported that the patient was still following up with various physicians and did not know if the symptoms had resolved at this time. General muscle weakness, muscle pain, leg pain, leg swelling, syncope and difficulty walking were considered to be other important medical events. Leg swelling and difficulty walking were considered to be disabling by the reporter, since the patient had difficulty walking due to the leg swelling. Additional information has been requested. ```PCP visit received 03/11/10 and 03/15/10 for DOS 11/26/07-09/03/09. Pt had no complaints. Pt received vaccination. On 09/10/08, Pt c/o reoccurring chest pain x 1wk. tx: Albuterol inhaler, ibuprofen. Impression: RAD. On 10/01/08, Pt with chest pain. Impression: chest wall pain, H Pylori. Tx: Prevacid. MedDRA PT Confusional state, Convulsion, Grand mal convulsion, Incoherent, Loss of consciousness, Staring, Tremor, Unresponsive to stimuli

Symptom Text: Parents awoke to child having a seizure at 0510 AM. Took child to Emergency Room. ER stated unsure that vaccine caused seizure-child going for further testing (EEG) 3/3/10 at Med. Center. ``` records received 03/08/10. Vaccination rec and ED rec. for DOS 02/26/10. Dx: seizure. ? adverse reaction to immunizations. Patient presented with c/o of seizure. Witness reported patient lost consciousness, was unresponsive, and experienced shaking all over. Patient was staring. Patient was confused after the episode. No prior history of seizures. Change of medications noted recent immunizations. Patient had no further seizure activity in ED dept. and was oriented x3. Patient stable and discharged. Plan: Follow-up with neurologist. ``` records received 03/09/10. Neurology outpatient consult. rec for DOS 03/04/10. Impression: Generalized convulsive epilepsy; without mention of intractable epilepsy. Chief complaint: New onset seizures. Parents found patient unresponsive with eyes looking straight. She had rhythmic shaking for 2-3 minutes. After the episode, the patient was incoherent. The patient had vaccinations 2 days prior to the event. Patient examined. Impression: Generalized convulsive epilepsy; without mention of intractable epilepsy. Record reflects that at this point unsure whether there was a link between immunization and the new onset seizure. Plan: Parents to administer Diastat if any seizure more than 4 min. and will hold off starting anti seizure meds for now, get emergent brain MRI and follow-up in 3 months.

Other Meds: None

Lab Data: CT scan ``` 03/08/10 CT head scan- normal, urine drug screen-negative, ALK phos-41 (L), WBC-3.9 (L), RBC-13.3 (WNL). ``` 03/09/10 LABS and DIAGNOSTICS: EEG- abnormal (epileptiform discharge over left frontal region). MRI brain (prominenc

History: Allergic to EES ``` 03/08/10 PMH: Lymph node resection. ```03/09/10 PMH: NKA, ADJ disorder w/ depression, sleep apnea, varicella uncomplicated.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Crohns disease, Dizziness postural, Fall, Head injury, Headache, Hypotension, Incorrect route of drug administration, Loss of consciousness, Malaise, Nausea, Presyncope, Vertigo

Symptom Text: Information has been received from a physician concerning an adolescent female patient aged 14 or 15 year old with no relevant medical history who in October 2007, was vaccinated with the first dose of GARDASIL (batch number not reported). In December 2007, i.e. two months after vaccination, the patient experienced malaise, vertigo, nauseas, loss of consciousness, cephalgia, and hypotension at 10/6. The patient was hospitalized. Vagal malaise was diagnosed. The patient recovered on an unspecified date. Follow up information received from the physician indicated that it was a case of misuse. The PV form and hospital report were provided. The patient was 15 years old at the time of the events. The patient received the first dose of GARDASIL subcutaneously (instead on intramuscularly as recommended) in the left arm on 17-OCT-2007. the patient has concomitant medication with TRINORDIOL. The patient experienced her vagal reaction on 10-DEC-2007. The event lasted 10 minutes and was reported as mild and not serious by the physician. The patient was seen at the emergency department (ED) on 10-DEC-2007 at 07:31 AM. In the corresponding report, it was specified that the patient had a history of pyelonephritis on malformative urinopathy with spontaneous resolution, tonsillectomy and adenoidectomy. The report stated that on 10-DEC-2007 on waking up the patient experienced a dizzy sensation difficult to describe with nausea followed when she got up by a fall with head injury and loss of consciousness for about 20 seconds. The event recurred a few minutes later. She also had persisting occipital and right-sided cephalgia. On arrival at the ED, her blood pressure was 109-65 mmHg, a pulse of 87 bpm and temperature of 37.2 C degrees. Clinical examination she had no vestibular nor cerebellar syndrome, cranial nerves were "Ok", pupils were symmetric and reactive. No neck stiffness was found, no photophobia, nor phonophobia. The patient has no sensory- motordeficit. Cardio-pulmonary examination found regular heart sounds, no murmur,

Other Meds: TRINORDIOL

MedDRA PT Hypotension, Loss of consciousness

Symptom Text: Information has been received via a business partner company from a physician concerning a 16 year old female who on 24-FEB-2010 was vaccinated with the first dose of GARDASIL. On 24-FEB-2010 the patient experienced transient hypotension and loss of consciousness for few seconds. The patient lay down to rest, and her blood pressure were measured for 20 to 30 minutes interval. After about 3 hours the patient was stabilized and her blood pressure was normalized. It was reported that the expiration date of the vaccine was 02-APR-2010. Upon internal review in the business partner company, transient hypotension and loss of consciousness were considered to be other important medical events. The causality with GARDASIL was not reported. Additional information is not expected.

MedDRA PT Activities of daily living impaired, Amnesia, Anxiety, Cardiac arrest, Constipation, Convulsion, Diarrhoea, Dizziness, Fatigue, Headache, Hypoaesthesia, Laboratory test, Nausea, Photosensitivity reaction, Syncope, Vomiting

Symptom Text: Information has been received from a consumer concerning her 18 year old daughter who by April 2008 was vaccinated with all three doses of GARDASIL (Lot# not reported). In September 2009, the patient experienced fatigue, seizures, headaches, nausea, throwing up, dizziness, numbness of the lower extremity of the toes and feet, memory loss, diarrhea, constipation, had fainted three times and had photosensitivity. It was reported that the patient had been in and out of the hospital (name and address not specified) since September 2009. It was also reported that in October 2009, while at college, the patient had a tilt table test done to check her blood pressure and during this procedure she had a seizure, her heart stopped and they had to do compressions. The patient's mother also mentioned that the patient had three seizures since then and she had seen a neurologist a neurologist, psychologist, and an endocrinologist. Multiple tests (unspecified) have been performed, with no results provided. The patient had to drop out of college and was put on some medication to help with the anxiousness she was experiencing. The reporter mentioned that her daughter had been taken off of all medication. At the time of the report, the patient had not recovered. Upon internal review seizure was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Ankyloglossia congenital, Drug exposure during pregnancy, Tongue tie operation

Symptom Text: Information has been received from a nurse for the Pregnancy Registry for GARDASIL and pediatric medical records concerning a female infant whose mother in approximately November or December 2007, was vaccinated with her first dose of GARDASIL (lot# not reported). In February 2008, her mother was vaccinated with her second dose of GARDASIL (lot# not reported). On 28-APR-2008 her mother was vaccinated with her third dose of GARDASIL (lot# not reported) and found out that she was pregnant. The mother's LMP was 28-MAR-2008. The pregnancy was confirmed on an unspecified date by a positive pregnancy test and complete bloodwork. Concomitant therapy included allergenic extract (allergy shot once a month). On 26-DEC-2008, the female infant was delivered via cesarean section with Apgars of 9 & 9 at 1 and 5 minutes respectively. On 29-JAN-2009, at 4 weeks well check, it was noted the infant was tongue tied. The infant was vaccinated with a second dose of hepatitis B vaccine (manufacturer unknown). The mother returned in February 2009 for her postpartum visit and she was breastfeeding the baby and there were "no problems" for her or the baby. She added the notes from the hospital and the office after the birth had no indication there were any problems. On 04-MAR-2009, at 4 month well check, the infant was vaccinated with a first dose of DT, ACTHIB, IPOL, PREVNAR (MSD). On 06-MAY-2009, at 2 month well check, the infant was vaccinated with the second dose of DT, ACTHIB, IPOL, PREVNAR and ROTATEQ (MSD) and tongue clip was performed. The infant's ankyloglossia was considered a congenital anomaly. The mother's experience has been captured in WAES # 0805USA00511. No further information is available. All medical records will be provided upon request.

MedDRA PT Chest pain, Feeling hot, Pruritus generalised

Symptom Text: Information has been received from a medical assistant concerning a 19 year old female with no pertinent medical history and had an allergy with BIAXIN who on 08-SEP-2009 and 12-NOV-2009 was vaccinated intramuscularly with the first and second 0.5 mL dose of GARDASIL (dose 1 LOT# 0702X and dose 2 LOT# 0702X). There was no concomitant medication. Three hours after vaccination, the patient experienced body itching and body heat. At five hours after vaccination, the patient experienced chest pain and went to the emergency room. Subsequently, on an unspecified date the patient recovered from body itching, body heat and chest pain. The reporter considered the body itching, body heat and chest pain to be other important medical event due to the patient possibly received oxygen in the emergency room. Additional information has been requested.

MedDRA PT Hypersensitivity, Swelling

Symptom Text: Information has been received from a registered nurse concerning an 18 year old male patient with asthma, milk allergy who on 09-MAR-2010 was vaccinated with the second dose of VARIVAX (Merck) (lot# not reported), the first dose of GARDASIL (Merck) (lot# not reported) and the second dose of ADACEL. On 09-MAR-2010, 8 minutes later the patient experienced an allergic reaction and used his inhaler. Eventually the patient was administered BENADRYL IM and then the patient developed swelling all over his body. He was next treated with an EPIPEN. At the time of this report, the patient's outcome was unknown. It was reported that the patient has a history of chronic conditions of asthma and milk allergy. He has been previously hospitalized with complications related to milk allergy and asthma. Upon internal review, allergic reaction and swelling all over his body that were treated with EPIPEN were considered to be other important medical events. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Activities of daily living impaired, Autoimmune thyroiditis, Convulsion, Lethargy, Menstruation irregular, Polycystic ovaries, Syncope, Type 1 diabetes mellitus

Symptom Text: Information was obtained on a request by the Company from the agency via a Public Case Details Form concerning a 16 year old female who in 2007 was vaccinated with three doses of GARDASIL (lot# 655742/0138U, batch# J0798; lot# 655742/0138U, J0800; batch# "J124") as part of school vaccination. Approximately 3 months post vaccination, the patient became very lethargic and also developed irregular menstruation. On 19-MAR-2008, the patient had a "seizure" at school and was seen at hospital where the diagnosis was a simple faint. However the patient developed further seizures leading to hospitalization for 3 weeks from the end of June 2008. In September 2008, the patient was diagnosed with polycystic ovary disease, Hashimoto's thyroiditis and Insulin-Dependent Diabetes Mellitus and was treated with metformin. Currently the patient was unable to attend school due to seizures and the need for constant supervision because of the risk of injury. At the time of the report, the patient's outcome was unknown. Her general practitioner was wondering about a possible link between her current symptoms (onset approximately 19-MAR-2008) and vaccination. The agency considered that convulsion, autoimmune thyroiditis, diabetes mellitus, menstruation irregular and polycystic ovaries were possibly related to vaccination with RECOMBIVAX HB. Onset date also reported as 21-AUG-2009. The original reporting source was not provided. No further information is available.

MedDRA PT Hemiparesis, Hemiplegia, Inflammation, Multiple sclerosis, Paralysis

Symptom Text: Initially information has been received from Health Authority (reference # ES-AGEMED-332303440) concerning a 27 year old female who in February 2009 (exact date not reported), was vaccinated with the second dose of GARDASIL (0.5 ml, IM, batch #, site and route not reported). It was reported that after the second dose vaccination, the patient suffered cerebral inflammation picture and paralysis with right hemiplegia. The patient was taken to hospital (admission and discharge dates not reported). It appeared that the patient was finally diagnosed as scleraosis multiple. To be noted that the only adverse event coded in the report was hemiparesis, with start date on 12-May-2009 (cessation date not reported, outcome unknown). To be noted, HA coded only hemiparesis, and the onset was on 12-May-2009. In November 2008 (exact date not reported), the patient was vaccinated with the first dose of GARDASIL, (IM, batch # and site of administration not reported). It had not reported whether the patient presented any adverse events after the first dose or not. Case reported as serious by HA with hospital admission as criteria. Outcome was unknown. Case was closed. Other business partner numbers included E2010-01380. No further information is available.

MedDRA PT Angiogram abnormal, Blindness, Fundoscopy abnormal, Optic discs blurred, Retinal exudates, Scotoma, Slit-lamp tests abnormal, Visual field defect, Visual field tests abnormal, Visual impairment, Vitreous disorder

Symptom Text: Information has been received from a physician via a published article title as stated above and from a website. It was reported that a previously healthy 17 year old female with myopia presented central with central and paracentral dark shimmering spots in the vision of her left eye for 3 days diagnosed as multiple evanescent white dot syndrome. The right eye was normal. She had received her first GARDASIL and meningococcal (unspecified) vaccination 1 month before the onset of visual loss. She had no history of fever or flu-like symptoms within the past year. She denied any health problems and no family history of vision problems. She had no history of neurologic problems and no pain on eye movement. The patient's maternal grandmother had psoriasis and severe rheumatoid arthritis. Best-corrected Snellen Visual acuity was 20/20 in the right eye and 20/200 in the left eye. There was no afferent pupullary defect. Amsler grid testing of the left eye showed central and paracentral scotoma. Findings on slit-lamp examination were normal except for 1+ anterior vitreous cells in the left eye. Fundus examination of left eye showed slight blurring of the optic disc margin, loss of the foveal reflex, 1+ posterior vitreous cells, and rare small white spots in the macula and nasal periphery. Humphrey 30-2 visual field testing showed enlargement of the blind spot in the left eye. Fluorescein angiography of the left eye showed subtle hyperfluorescent spots corresponding to the white spots seen on fundoscopy. Optical coherence tomography of the left eye showed loss of normal architecture of the deep retina. Findings on examination and testing of the right eye were normal. The patient was HLA-B27-positive, but was not HLA-B51-positive. On follow-up examination 2 months after the initial evaluation, visual acuity had improved to 20/20 in the left eye and the Humphrey 30-2 visual field was normal. It was reported that the association of the patient's multiple evanescent white dot syndrome with the GARDASIL and meningococcal vaccine

MedDRA PT Activities of daily living impaired, Asthenia, Laboratory test, Pain, Similar reaction on previous exposure to drug

Symptom Text: Information has been received from a physician and a medical assistant concerning a 13 year old female patient who on 06-MAY-2009 was vaccinated with the first 0.5 ml dose of GARDASIL (Lot # 658282/0929U) concomitantly with a dose of MENACTRA (Lot # UF389AA). On 04-AUG-2009, the patient was vaccinated with the second dose of GARDASIL (Lot # 658282/0929U) and on 19-JAN-2010, the patient was vaccinated with the third dose of GARDASIL (Lot # 658282/0929U). According to the physician, after the patient received her third dose of GARDASIL, she reported that she was extremely sore and weak. The medical assistant reported that the patient had a physician's note to be out of school on 25-JAN-2010 and remained out of school for the rest of that week (until approximately 29-JAN-2010) for symptoms of being extremely sore and weak, it was also reported that the patient had another note to be out of school for symptoms of extremely sore and weak from 01-MAR-2010 to 12-MAR-2010 (also reported by the physician as "missed 2 months of school"). The physician also mentioned that the patient had "mild symptoms" following the first and second dose of GARDASIL (dates not reported). The medical assistant stated that the patient had not recovered. The patient sought unspecified medical attention. Diagnostic laboratories test were performed (not results provided). Upon internal review the patient remained out of school for symptoms of being extremely sore and weak, was considered disabling. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Blindness, Demyelination, Headache

Symptom Text: It was reported in a newspaper article that a 16 year old female patient on an unspecified date, was vaccinated with the second dose of GARDASIL. Subsequently the patient experienced a visual loss in the right eye and a left side headache. Over the next 24 hours, the patient's symptoms worsened to include her left eye and a more severe headache. Ten days after the second vaccine, the perfectly healthy patient was left almost totally blind. At the time of reporting, the outcome was unknown. The reporter stated that it was possible that human papilloma virus was the precipitant for the demyelinating event in the patient presented here. It was tempting to speculate whether there may be a specific immune mechanism initiated with human papilloma virus not yet identified, which resulted in not only acute demyelinating encephalomyelitis but also in an unusual clinical course that resulted in persistent visual loss. An expert who worked in the vaccine trials said that the majority of vaccine injuries actually occur in what she called the 'biologically plausible time frame' which was, she said, up to 42 days after the vaccine. Upon internal review, visual loss in the right eye and visual loss in the left eye were determined to be other important medical events. No further information is available.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Areflexia, Dysaesthesia, Epilepsy, Headache, Hypoaesthesia, Inappropriate schedule of drug administration, Neurological examination normal, No reaction on previous exposure to drug, Somnolence

Symptom Text: Case reported by Health Authority on 07-JAN-2010 under the reference number PEI2009024114. It was reported by a neurologist that a 27 year old female patient was vaccinated with a dose of GARDASIL (lot #, injection site and route not reported) on 16-JUN-2009. Concomitant therapy included (not specified) hormonal contraceptives for systemic use and ciprofloxacin (treatment of urinary tract infection in June 2009, exact date not reported). On 24-JUN-2009 the patient experienced left-sided hemihypaesthesia, headache, and drowsiness for approximated 5 weeks. The last examination performed on 17-AUG-2009 only revealed dysaesthesia of the left forearm. At the time of reporting to HA (02-SEP-2009) the patient had not recovered from dysaesthesia. Nothing was reported about any diagnostics, only " no changes of laboratory parameters" was mentioned. Previous vaccination with GARDASIL on an unspecified date was well tolerated. This file is closed. Follow up information was received on 02-MAR-2010. A hospital report and a neurological examination report were provided by the Health Authority. This case has to be upgraded. The patient was hospitalized from 08-JUL-2009 to 10-JUL-2009 due to left-sided hemihypaesthesia which occurred during a holiday in the evening of 24-JUN-2009. Investigations from a former examination were adjudged. Cranial magnetic resonance imaging (MRI) showed normal results, electroencephalography (EEG) showed epileptic like potentials. Treatment with VALPROAT had been started. At the time of hospitalization another EEG was carried out and showed no further epileptic like potentials. Additional to hemihypaesthesia absent abdominal reflexes were detected. Muscles reflexes were "agile" at both sides. Several examinations included electrophysiological, psychiatric, general physical and ECG showed normal results. CSF (cerebrospinal-fluid) cell count was increased with 12/ul. Blood sample from 08-JUL-2009 showed increase of thyroid stimulating hormone (TSH) with 6.27 ulU/ml (history of hypothyroidism). Other l

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Blood pressure increased, Caesarean section, Drug exposure during pregnancy, Failed trial of labour, Pregnancy induced hypertension

Symptom Text: Information has been received through the pregnancy registry for GARDASIL, from a registered nurse concerning a 21 year old female with no medical history or drugs allergies, who on 13-MAY-2009 was vaccinated with a dose of GARDASIL (lot # 661953/1130X). There was no concomitant medication. The patient is now pregnant, the pregnancy is normal to date; her LMP was 11-APR-2009. The patient had a urine pregnancy test. The patient sought medical attention through an office visit. Follow up information received on 30-JUN-2009 from a registered nurse stated that the patient was a female, who on 13-MAY-2009 was vaccinated with a first dose of GARDASIL (lot # 661953/1130X). Concomitant therapy included prenatal vitamins. It was also reported that the patient didn't have any previous pregnancies. Follow up information received from a physician indicated that the patient had a medical history of Rhesus antibodies negative. On 26-OCT-2009 the patient was given RHOGAM times 1 for RH negative and on 13-JAN-2010 the patient was placed on therapy with labetalol 100 mg twice a day for increased blood pressure. On 16-JAN-2010 at 39.6 weeks from her last menstrual period the patient gave birth to a normal baby boy who weighed 8.10; length 20. Due to failure to progress the patient had a C-section done. It was also reported that on an unspecified date the patient developed pregnancy induced hypertension. Upon internal review C-section due to failure to progress was determined to be an other important medical event. No further information is available.

Other Meds: RHOGAM; vitamins (unspecified)

Lab Data: Urine beta-human, positive

MedDRA PT Autonomic nervous system imbalance, Back pain, Gallbladder disorder, Migraine, Neck pain, Neuralgia, Syncope

Symptom Text: Information has been received from a healthcare worker concerning her 25 year old daughter who in July 2009, was vaccinated with her third dose of GARDASIL (lot # not reported). In approximately July 2009, after patient received her third dose of GARDASIL, she began to have adverse experiences which led to an emergency room visit and hospitalization. She started pain in the neck and back, nerve pain, autonomic dysfunction, chronic low blood pressure, gall bladder disease and possible gall bladder removal, vaso/vago syncope, and migraines. These adverse effects have been debilitating with her job. It was also reported that during the patient's hospitalization, her blood pressure "bottomed out", and her heart rate "skyrocketed". Unspecified laboratory tests were performed (results not provided). At the time of the report the patient was on a machine to monitor blood pressure. The patient was being treated by a cardiologist and by a nurse practitioner. The reporter stated that "these adverse events are still going on but have improved slightly". The reporter considered pain in the neck and back, nerve pain, autonomic dysfunction, chronic low blood pressure, gall bladder disease and possible gall bladder removal, vaso/vago syncope, and migraines to be immediately life-threatening, disabling and other important medical events. Additional information has been requested.

MedDRA PT Breast feeding, Breech presentation, Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a consumer, for GARDASIL, a Pregnancy Registry product, concerning a 25 year old female with no relevant medical history who was vaccinated with the second dose of GARDASIL (batch number not reported) in March 2009 as she was pregnant. Her latest Menstrual Period dated back to 03-FEB-2009 and the date of delivery was estimated for 17-NOV-2009. Her dosage in iron was a little low. The pregnancy was spontaneous. Follow up information received on 09-MAR-2010 by telephone: The case which was not medically confirmed was upgraded to serious due to the seriousness criterion "other medically relevant", i.e. caesarean section. The patient's pregnancy was uneventful. She gave birth to a female baby on 18-NOV-2009 by caesarean section due to breech presentation. The baby was doing fine. She was breastfed. The patient had had no previous pregnancy. The third injection of GARDASIL was scheduled soon. No further information expected. Other business partner numbers include E200906179.

Other Meds: Unknown

Lab Data: Urine iron test, dosage in iron was a little low

MedDRA PT Abdominal pain, Anti-cyclic citrullinated peptide antibody, Arthralgia, Back pain, Blood creatinine normal, Blood immunoglobulin G normal, Blood lactate dehydrogenase normal, Blood urea normal, Blood uric acid normal, C-reactive protein normal, Connective tissue disorder, Dyskinesia, Dyspnoea, Gamma-glutamyltransferase normal, Gastritis, Gastrointestinal infection, Gastrointestinal mucosal disorder, Gastrointestinal tract mucosal discolouration, Hip dysplasia, Immunoglobulins normal, Joint effusion, Joint stiffness, Joint swelling, Musculoskeletal pain, Nausea, Pain, Restlessness, Reticulocyte count normal, Rheumatoid factor, Tonsillitis, Urticaria

Symptom Text: Information has been received from a health care professional on 02-MAR-2010 and additional information on 03-MAR-2010. It was reported by a gynecologist that a 14-year-old female patient received a complete vaccination series with 3 doses of GARDASIL into the deltoid muscle on 03-SEP-2007 (D1, lot #1537F, batch #: NF32810), on 05-NOV-2007 (D2, lot # 1537F, batch #: NF32810) and on 03-APR-2008 (D3, lot#: 0354U, batch number: NF58150). On 09-APR-2009 the patient reported that she experienced severe rheumatic symptoms (verbatim) shortly after the first dose. Further information received through the outpatient department's and hospital report on 03-MAR-2010. Family medical history: (information illegible). The patient was treated in a rheumatologic outpatient department since 07-MAR-2009 and was hospitalized from 05-MAY-2009 to 08-MAY-2009 (all results were summarized in one report). In May 2008, the patient experienced both-sided hip pain and was referred to an orthopedist who performed an MRI of the hip. It showed degenerative changes at the acetabulum (right side more than left) and a moderate articular effusion which was referred to arthritic activation at hip dysplasia. A surgical sanitation of the hip joints was suggested. After referring the patient to the surgeon a rheumatologic disease was suspected. A taken blood sample showed positive HLA-B27 antigens. She developed increasing hip pain, mild morning stiffness of both hips, painful temporomandibular joints and the opening of the mouth decreased to 2.5 cm. She reported, that the left ankle was often swollen, she suffered from knee pain when walking and pain in the lumbosacral area. Two months before admission the patient experienced tonsillitis and gastrointestinal infection. Additionally the patient used inlays and wore a dental splint. On 17-MAR-2009 physical investigation showed pain during flexion and extension of the hip joint (both-sided), dorsal extension and plantar flexion and opening the mouth (possible up to 2.5 cm). The same day special diagnost

MedDRA PT Condition aggravated, Headache, Hypersensitivity, Mass

Symptom Text: Information has been received from a neurologist concerning a 16 year old female patient who on an unspecified date, was vaccinated with a dose of GARDASIL (lot# not reported) at another health care providers' office. On 02-MAR-2010 the patient was admitted to hospital with severe headaches and increased fluid pressure in the head known as pseudotumor. 2 spinal taps were performed with pressure elevated both times. The patient was still in the hospital, and her pseudotumor persisted. The neurologist stated that the patient's mother was insisting pseudotumor was related to therapy with GARDASIL. Follow up information has been received from the neurologist concerning the patient who on 29-DEC-2009 was vaccinated with the first dose of GARDASIL. It was reported that the patient had a history of headaches prior to receiving GARDASIL and the complaint of headaches started on 30-DEC-2000. After the vaccination, the patient's headache became very severe. The patient also had a severe allergy (not specified) and the physician had "no idea if the patient's allergy was secondary to receiving GARDASIL. The patient had an appointment with the neurologist on 08-JAN-2010. On 01-MAR-2010, the patient was admitted to hospital. While in the hospital the patient had "two spinal taps to reduce the patient's fluid pressure" and was treated with steroid therapy. The patient was treated with another medication (name of medication not specified) and the patient had a severe reaction to the medication, which increased her fluid pressure. The neurologist stated that the patient was taken off all medications due to her reaction to the unspecified medication. The patient was discharged from the hospital on 06-MAR-2010 and had a scheduled follow-up appointment to see the neurologist. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Arthralgia, Asthenia, Joint stiffness

Symptom Text: Information has been received from a health authority (local ref. # BS20100135 and BS10D0063) concerning a 14 year old female patient who had received a second dose of GARDASIL (lot #, batch # and site of administration not reported) via intramuscular route in October 2009. The patient had received a first injection of GARDASIL in August 2009. The patient had been sent to a rheumatologist by her family doctor for intense asthenia and polyarthralgia which began in mid-November 2009. In mid-November, onset of arthralgia in wrists, hands, ankles and knees without joint swelling, without night waking with a period of morning stiffness which lasted approximately one hour. These were isolated symptoms without any other clinical focus. On 14-JAN-2010: sedimentation rate = 46 mm 1st hour, CRP = 21 mg mg/L, fibrinogen = 4.21 g/d, antistreptolysin was negative, rheumatoid factors were negative. On 01-FEB-2010, negative antinuclear antibodies, negative soluble nuclear anti antigen autoantibodies, negative parvovirus serology, sedimentation rate 1st hour = 43 mm, CRP = 11 mg/l, fibrinogen = 4.57 g/l, no anomaly on urinary sediment, negative proteinuria, normal hand radiography, no HLA B27 antigen, negative Lyme disease serology, normal C4 complement. The patient had treatment with ASPIRINE 3 g/d since 15-JAN-2010, which provided partial relief to the patient. She also started treatment with PLAQUENIL on 08-FEB-2010, one tablet daily during one month then two tablets daily. Laboratory values to be checked around 20-MAR-2010 with another consultation with rheumatologist. Outcome to follow. At the time of reporting, the patient had not recovered. To be noted that asthenia and stiffness were added to events coded by health authorities. The health authorities assessed the causal relationship between the reported reactions and vaccination with GARDASIL as 'doubtful' according to the method of assessment. No further information is available.

Other Meds: unknown

MedDRA PT Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a health care professional for the pregnancy registry for GARDASIL concerning a 16 year old female patient with no pertinent medical history reported who on 23-APR-2009 was vaccinated with the second dose of GARDASIL (Lot # not reported). It was reported that the patient was pregnant while vaccinated. The last menstrual period dated back to February 2009 and gestation was about 9 weeks. The estimated delivery date was on 08-NOV-2009. At the time of reporting, the patient had no adverse reactions. Follow-up information has been received. The reporter was contacted by telephone. She could not confirm the LMP date but specified that the patient delivered on 20-DEC-2009 by cesarean section and gave birth to a baby girl. The baby had a peripartum infection that kept her hospitalized until 28-DEC-2009 (manufacturer ref. # E2010-01538, WAES# 0907USA01036B1). At the time of reporting, the patient and her baby were well. The event of cesarean section was considered to be an other important medical event. Other business partner numbers include: E2009-05719. No further information is available.

MedDRA PT Inappropriate schedule of drug administration, Motor dysfunction, Muscular weakness

Symptom Text: Initial information has been received from a pharmaceutical company physician, concerning a 40 or 41 year old female who on June 2009 (exact date not reported) was administered the second dose of GARDASIL (lot#, batch#, route and site of administration not reported). It was reported that the patient started with clinical picture of motor weakness on July 2009. At the time of reporting the patient continued with this weakness, and she was being studied by the neurology department. The reporter did not know whether the patient was under medical treatment or not. This is a case of misuse. GARDASIL administered to a 40 year old female when this vaccine was indicated for males and females from 9 to 15 years old and females from 16 to 26 years old. The event of muscle weakness was considered to be an other important medical event. Other business partner numbers include E2010-01417. No further information is available.

MedDRA PT Condition aggravated, Dyskinesia, Epilepsy, Grimacing, Muscle twitching, Nervous system disorder, Psychomotor hyperactivity, Road traffic accident, Tonic convulsion

Symptom Text: Information was obtained on request by the company from the agency via a public case details form concerning a 21 year old female patient who on 15-MAY-2008 was vaccinated intramuscularly with a second dose of GARDASIL (lot# not reported). It was reported that the patient had epilepsy since childhood, seizure free for 3 years. the patient developed refractory epilepsy around 7 months after the second dose of GARDASIL. In December 2008, the patient had a seizure which resulted in a car crash and subsequently her seizures had been refractory. On 15-DEC-2008 the patient developed epilepsy and was hospitalized. Electroencephalography (EEG) monitoring findings demonstrated the inter-ictal EEG to be markedly abnormal with frequent intermittent paroxysms of high amplitude generalized 3-4 Hz polyspike ad wave activity with a definite right frontal emphasis at times. There were also isolated inter-ictal low amplitude sharp amplitude sharp waves seen at F4 during wakefulness and sleep. Patient was monitored for 48 hours and in that time, ten seizures were recorded of five different types. Four events including left foot pedaling, bilateral upper limb jerks, facial grimacing and right leg twitching all occurred from sleep and were associated with bifrontal/right frontal ictal rhythm. Neuroimaging performed last year demonstrated a small focus of heterotopic grey matter deep within the right frontal lobe. the inter-ictal EEG features of generalized discharges, focal discharges and bursts of generalized paroxysmal fast activity in association with multiple seizures types including tonic seizures and seizures with a right frontal semiology was Highly suggestive of a symptomatic generalized epilepsy. Magnetic resonance imaging (MRI) in January 2009 showed a very small focus of likely heterotopic grey matter in the right oral lobe deep in the grey matter. The patient had tried multiple anticonvulsant KEPPRA and EPILIM, then changed to TOPAMAX and lamotrigine, reduced TOPAMAX to 125 mg/BID and increased lamotrigine to 20 mg mane

Other Meds: Unknown

MedDRA PT Drug exposure during pregnancy, Neonatal infection

Symptom Text: Information has been received from a healthcare professional concerning a female neonate born via cesarean section who experienced an unspecified peripartum infection. Her mother, a 16 year old female patient, had received the second dose of GARDASIL (batch number not reported) on 23-Apr-2009 (cf linked case). The mother was vaccinated while pregnant. She delivered on 20-DEC-2009. Peripartum infection kept the patient hospitalized until 28 DEC-2009. At the time of reporting, the patient and her mother were well. No further information is expected. Case linked with serious case E2009-05719 (WAES 0907USA01036). Other business partner numbers include E2010-01538. This is a consolidation of two reports concerning the same patient. It was determined that WAES #1003USA01419 was opened without making the split from the mother's episode. Therefore, WAES #1003USA01419 is being deleted from our files and the report had been created from the mother's episode WAES #0907USA01036 and was assigned WAES #0907USA01036B1. WAES #1003USA01419 was previously sent to the FDA on 15-MAR-2010.

MedDRA PT Breast abscess, Breast inflammation, Breast pain, Breast swelling, Erythema, Haemorrhagic cyst, Skin warm

Symptom Text: Case received from a physician on 04-MAR-2010: This case was linked with serious case E2009-10795 (WAES # 0911USA04796) (same reporter, same vaccine, similar reactions). A 14 year old female patient had received a second dose of GARDASIL (lot # 1202U, batch # NJ33350) on 14-NOV-2009. Four months after vaccination, the patient went to consultant for pain in breast, and it was observed that the breast was tight, red and warm. Ultrasound showed images in favor of haemorrhagic cyst. A retronipple abscess also occurred at the side of the vaccination. Complete blood count found leukocytes at 8700 and polynuclear neutrophils at 61%. C-reactive protein revealed a little inflammatory syndrome. There was no sign of diabetes. Corrective treatment with AUGMENTIN, 3 g per a day, ibuprofen 3 times 400 mg per a day and acetaminophen were given. Pain and reactions significantly regressed under AUGMENTIN. The check-up showed no adenopathy, skin integrity, no sexual relations and no concept of recent shaving. At the time of the report, the patient had not fully recovered. The reporter considered the case as serious (OPME). To be noted that the patient had received the first dose of GARDASIL in September 2009. She had no history of breast disease in her family. The patient had an abundant menstruation and normally menstruated but was not taken contraception. She had pertussis which had been treated and for which she had been hospitalized late in 2009. Other business partner numbers include E2010-01486.

MedDRA PT Drug exposure during pregnancy, Iron deficiency

Symptom Text: Initial report received on 09 October 2009 from a health care professional. A 16 year old female patient, with no medical conditions or allergies, received a right arm 0.5 ml intramuscular injection of MENACTRA (lot number U2908AA) on 16 September 2009 as part as part of routine immunization. The patient was pregnant at the time of vaccination. Concomitant medications included FERROUS SULFATE 325mg. Her last menstrual period was either 15 or 19 August 2009 and her expected date of confinement is 26 May 2010. Prenatal testing was not reported. The patient had no previous pregnancies. No adverse event was reported. The patient had no previous pregnancies. No adverse event was reported. Follow up information received on 28 December 2009 from a health care professional. The patient had a questionable history of high blood pressure and no known use of recreational drugs or alcohol. The patient's last date of her menstrual period was 19 August 2009 and estimated date of delivery was 26 May 2010. In addition to receiving MENACTRA, the patient also received a first dose of Tdap (manufacturer not provided, lot number AC52B036BA) and a third dose of GARDASIL (manufacturer Merck, lot number 0100X) on 16 September 2009. The patient was reported as having an iron deficiency during the pregnancy (onset date not provided) and was being treated with iron. The reporter stated that at the time of the last attempt in contacting the patient, the patient had still not received prenatal care at that time.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received a Registered Nurse for the pregnancy registry for GARDASIL, concerning a 19 year old female patient with no known allergies and no pertinent medical history, who on 19-JAN-2009 was vaccinated intramuscularly with 0.5 ml of her first and only dose of GARDASIL (Lot# 660391/0063X) while she was pregnant. The urine pregnancy test was positive (LMP: 12-DEC-2008, EED: 18-SEP-2009). As of 15-JAN-2009 the patient was fine. In follow-up the registered nurse reported that they were unable to obtain authorization from the patient. Follow-up information from another registered nurse revealed that the patient has a medical history of Chlamydia infections in September 2007 and January 2009. In February 2009, the patient experienced an elective termination of pregnancy. It was unknown if the fetus was normal or if the products of conception were examined. The patient was seen for LPE (during early-pregnancy) pregnancy test which was positive. The patient did not have obstetric care due to pregnancy terminated per the patient. Upon internal review, elective termination was considered to be an other important medical event. Additional information is not expected.

MedDRA PT Balance disorder, Dysarthria, Dysgraphia, Fall, Fatigue, Hemiplegia, Hypokinesia, Immune system disorder, Impaired work ability, Insomnia, Loss of consciousness, Malaise, Nausea, Nervous system disorder, Tremor, Vaccine positive rechallenge, Visual acuity reduced

Symptom Text: Information has been received from newspaper articles title via CSL as part of a business agreement concerning a 26 year old female who in May 2008, was vaccinated with the first dose of GARDASIL. Two weeks later, the patient lost her balance and fell. The patient noted that "at the time, she didn't think anything of it. She just thought she was clumsy." In August 2008, the patient received the second dose of GARDASIL. About four weeks after that, all of the symptoms began. The patient lost some of her eyesight, started to feel nauseous, was extremely tired but couldn't sleep. Then she became paralysed on the right side of her body. The patient couldn't walk properly, lack of fine motor skills, and her ability to write went within a week. The patient reported "the whole thing was rapid and slow all the same time. It was like I had had a stroke." The patient sought the help of a neurologist. Between February and July 2009, the patient showed further declined, forcing her to give up her job. The patient noted that "Before all of this she was just so healthy." Since approximately September 2008 (18 months from the time of the article), the patient had been treated for multiple sclerosis and acute disseminated encephalomyelitis, neurological disorders caused by damage to the myelin sheath that covers nerves. It was reported that "the patient's illness remained a mystery and she had not officially been diagnosed with either disease." At the time of article, the patient struggled with paralysis, lack of the fine motor skills, tremors, slurred speech, fatigue, sickness and a compromised immune system. The outcome for lost her balance, fell, lost some of her eyesight, feel nauseous, could not sleep, treated for multiple sclerosis not officially diagnosed, treated for acute disseminated encephalomyelitis not officially diagnosed, neurological disorders, lost ability to write was unknown. The patient also reported that she experienced "blackouts" (onset date, outcome not reported). Upon internal review, lost some of her ey

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Confusional state, Convulsion, Disorientation, Epilepsy, Fatigue, Headache, Pain in extremity, Partial seizures, Somnolence, Tongue biting, Vomiting

Symptom Text: Information was obtained on request by the company from the agency via a public case details form concerning a 16 year old female patient who on 18-SEP-2007 was vaccinated intramuscularly with a dose of GARDASIL (lot not reported). On 18-SEP-2007 the patient developed convulsion and was hospitalized. It was reported that the patient fell asleep on the school bus as she felt a little tired and recalled awakening approximately two hours later being in the back of an ambulance and taken to hospital to the ED. She was apparently disoriented and did not know her name and gave the wrong name and also did not know her parents' names. Apparently she was sitting on the back seat of the bus disoriented and that she had three to four convulsions. She was confused, had a bad headache and vomited twice. She had bitten her tongue, had not been incontinent and the following day her arms and legs were really sore and she slept a lot. CT scan of head was unremarkable and EEG was markedly abnormal demonstrating frequent epileptiform discharges which occurred intermittently in the left frontal region. They were much more marked during sleep and were associated with continual focal low amplitude slowing. It was suspected that the patient had a focal seizure which secondarily generalized a number of times on the bus. Considering it all occurred within the one 24 hours period we called this a single event even though it was apparent that she had a cluster of seizures. The patient was observed in hospital emergency and later she discharged. Subsequent MRI was "unremarkable" and no further seizures within the following 3 months. The patient had been reviewed by a neurologist for 2 times and she was not prescribed anticonvulsants. At the time of this report, the patient had recovered from convulsion. The reporter felt that convulsion was possibly related to therapy with GARDASIL. The original reporting source was not provided. No further information is available.

Other Meds: Unknown

Lab Data: Head computed axial tomography, 18?Sep07, unremarkable; electroencephalography, 18?Sep07, markedly abnormal demonstrating frequent epileptiform discharges; magnetic resonance imaging, 18?sep07, unremarkable

History: Unknown

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Foetal growth retardation, Intra-uterine death, Uterine dilation and curettage, Vaginal haemorrhage

Symptom Text: Initial and follow-up information has been received from a consumer and medical assistant, for the Pregnancy Registry for GARDASIL. The consumer is a 22 year old female with a history of gallbladder removal about 10 years ago. On 08-Jan-2010, the patient received a dose of GARDASIL (lot # 663454/0672Y) IM. No concomitant vaccinations were administered at that time. The medical assistant stated that on 24-Feb-2010 the patient reported to the physician that she was pregnant. The patient was referred to the obstetrician. Her last menstrual period was on 23-Dec-2009. The consumer reported that she had a urine test when given the vaccine. The test showed she was not pregnant. A few weeks later, she found out she was pregnant. She went in for a blood work and an ultrasound on 06-Mar-2010 (also reported as 07-Mar-2010). They showed she would be 10 weeks pregnant but the fetus stopped growing at 5 weeks. As of 10-Mar-2010, the consumer was also experiencing spotting. The consumer stated that she had visited her physician's office on 11-Mar-2010 and the physician had confirmed that her baby was not properly developing. The consumer also reported that a dilatation and evacuation had been scheduled for her by the physician on 12-Mar-2010. The medical assistant reported that "the patient's sac was measured at six weeks and the patient had a miscarriage". On 12-Mar-2010, the patient was scheduled for a dilatation and evacuation procedure. Upon internal review, the fetus stopped growing at 5 weeks and miscarriage were considered other important medical events. Additional information has been requested.

Other Meds: Unknown

Lab Data: ultrasound, 03/06/10, fetus stopped growing at 5 weeks - see narrative; beta-human chorionic, 01/08/10, negative; laboratory test, 03/06/10, fetus stopped growing at 5 weeks - see narrative; beta-human chorionic, 01/??/10, a few weeks later

MedDRA PT Dizziness, Nausea, Paraesthesia, Urticaria

Symptom Text: Initial report was received on 16 March 2010 from another manufacturer, with document number WAES 1003USA00893. The initial reporter to this manufacturer was a healthcare professional. Verbatim from the report: "Information has been received from a physician and licensed practical nurse. Information concerning a 14 year old female with attention deficit disorder and allergic to Penicillin who on 25-Feb-2009 was IM vaccinated with a first dose of GARDASIL vaccinated on 25-Feb-2010 with a dose of GARDASIL (Lot no. 662529/1317Y) given in left upper thigh; a dose of VAQTA (Lot no. 666201/1538Y) given in right upper thigh; a dose of MENACTRA (Lot # 430800AA) given in left lower thigh and a dose of ADACEL (Lot # C3352AA) given in right lower thigh. Concomitant medication included ADDERALL." "It was reported that the patient called the physician's office at the afternoon, the patient experienced hives, nausea and dizziness and also complaint of tingling in both legs. Patient had taken 12.5 mg. of BENADRYL twice before going to the emergency room. The patient was seen at approximately 23:00PM the same day and symptoms were gone. Patient received a dose of SOLU MEDROL IV and ZANTAC prior to being discharged from emergency room. At the time of the report the patient was recovered." "Upon internal review, hives, nausea, dizziness and tingling in both legs were considered to be other important medical events." "No further information is available." Of note, MENACTRA lot number 43080AA (also reported as 430800AA) is not a valid sanofi pasteur lot number. Documents held by sender: None.

Other Meds: ADDERALL

Lab Data:

History: The patient's medical history included attention deficit disorder and a penicillin allergy. It was not reported if the patient had any illness at the time of the vaccinations.

MedDRA PT Abdominal pain, Drug intolerance, Headache, Hypokinesia, Injection site pain, Injection site swelling, Myalgia, No reaction on previous exposure to drug, Pyrexia

Symptom Text: Information has been received from a physician concerning a 17 year old female who on 28-JAN-2009 around 5 p.m., was vaccinated with a second dose of GARDASIL vaccine (route not reported, lot number 1882U, batch number NJ08320). In the night, around half past midnight, on 29-JAN-2010, the patient experienced very intense headache, violent pains at the level of the abdomen, very intense muscle pain, with difficulty moving and fever at 39 degrees C. All events were reported as severe. The patient took corrective treatment with DOLIPRANE, and timebutine. The next morning at 9a.m., the patient's condition had improved with regression of muscle pain and fever, in spite of persisting headache and abdominal pain of lower intensity. It was noted that the patient received the first dose of GARDASIL vaccine one and a half months before this report (on approximately 14-DEC-2009). Additional information was received on 29-JAN-2010. The physician specified that the vaccine had been stored at the patient's home at a temperature of 5C. Additional information was received on 10-FEB-2010. The physician provided the patient's initials. She also reported that "everything had gone back to normal" 2 days after vaccination, and that the patient had not experienced adverse events after the first dose of GARDASIL vaccine. Follow-up information was received on 17-MAR-2010. Upon medical review, the case was upgraded to serious according to the reporter's assessment. The patient's initials were corrected. Her date of birth, weight and height were provided. The patient was 16 years old at the time of the events and not 17 as initially mentioned. The patient had no personal medical history. She received the injection of GARDASIL vaccine intramuscularly into the left arm. 6 hours after vaccination, she experienced cephalgia, fever at 39C, violent myalgia and abdominal pain. Six and a half hours after vaccination, the patient experienced swelling and pain at the injection site. Cephalgia and myalgia were described as "very violent". The repor

MedDRA PT Human papilloma virus test positive, Menstrual disorder, Papilloma viral infection, Precancerous cells present

Symptom Text: Information has been received via the internet from a consumer concerning his or her daughter who was vaccinated with 2 doses of GARDASIL (lot number, date, route and site not reported). Approximately a year later the patient had tested positive for high-risk HPV. The patient suffered SEVERE side effects from them which incapacitated her for 2 1/2 months. The patient continued to experience menstrual problems even though it had been over a year. At the time of the report, the patient had precancerous, high-risk HPV. It was reported that the reporter believe that the patient's HPV was the result of the vaccines because the patient did not have HPV when she received the vaccines. Severe side effects and menstrual problems were considered to be disabling. This is one of several reports received from the same source. Attempts to verify the existence of an identifiable patient have been unsuccessful.

MedDRA PT Death

Symptom Text: Information has been received from a consumer via an internet newspaper concerning a patient who on an unspecified date was vaccinated with a dose of GARDASIL. It was reported that a parent can be guilty because if he had known about the side effects, then he might not have allowed the pediatrician to vaccinate the child, which resulted in death (cause of death unspecified). It was unknown if the patient sought medical attention. It was also reported that polysorbato 80 or tween 80 that is a chemical that causes infertility in mice and aluminum which is neurological toxin are in GARDASIL. This is one of several reports from the same source. Additional information is not expected.

MedDRA PT Chronic fatigue syndrome, Condition aggravated, Depression, Migraine, Syncope

Symptom Text: Initial and follow up information has been received from a office medical assistant concerning her 12 year old daughter with no known drug allergies, neurocardio syncope since the 5th grade, Helicobacter pylori, irritable bowel syndrome and asthma who on 26-AUG-2008 (also reported 13-AUG-2010) was vaccinated with a dose of GARDASIL (Lot#657868/0523U) and VARIVAX (Oka/Merck) (Lot#660944/0512X) at a county health. Concomitant vaccination included MENACTRA and BOOSTRIX. Other concomitant therapy included FLORINEF, TOPAMAX and PREVACID. On 13-SEP-2008 the patient experienced chronic fatigue syndrome. Then the patient's neurocardio syncope was exacerbated leading to migraine headaches and was hospitalized twice in 2008, for an unspecified amount of time. On an unspecified date, the patient was seen by psych who said that the patient was depressed and brought on her own headaches. The reporter stated that this was not true. The patient had been followed by neurology for her neurocardio syncope. It was noted that the patient has been home schooled since 2009, since her conditions keep her from going to school. At the time of the report, the patient had not recovered. Therapy with GARDASIL was discontinued. Chronic fatigue syndrome, exacerbated neurocardio syncope, migraine headaches and depressed were considered to be disabling by the office medical assistant. Additional information has been requested.

MedDRA PT Condition aggravated, Urticaria, Vaccine positive rechallenge

Symptom Text: Information has been received from a Health Authority (reference number PEI2010003888). It was reported by a physician that an 18 year old female patient was vaccinated with a second dose of GARDASIL (lot number, injection site and route not reported) on 28-DEC-2007. Subsequently the patient experienced aggravation of urticaria which had begun on 07-NOV-2007 after the first dose of GARDASIL given on 26-OCT-2007. Up to time of reporting to Health Authority urticaria was recurring and patient had not recovered. The third dose was not given. Upon internal review the case was considered as serious due to medical judgement. Other business partner numbers include E2010-01494. No further information is available.

MedDRA PT Dyskinesia, Eye rolling, Hypotension, No reaction on previous exposure to drug, Syncope, Tonic clonic movements

Symptom Text: Information was obtained on a request by the Company from the agency via a Public Case Detail form concerning a 21 year old female patient who on 28-DEC-2009 was vaccinated with the third dose of GARDASIL (intramuscular route, lot # unknown). On 28-DEC-2009, the patient collapsed shortly after receiving the third dose of GARDASIL, her body had 2-3 jerks and her eyes rolled upward. It was reported that the episode lasted less than 1 minute. It was reported that the blood pressure was low post episode so the general practitioner insisted on IV line and transferred the patient to the hospital. It was reported that the patient did not have problems following the first and second dose of GARDASIL. The agency felt that hypotension and tonic clonic movements were possibly related to therapy with GARDASIL. On 28-DEC-2009, the patient recovered. The original reporting source was not provided. Additional Information is not expected.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician for GARDASIL, a Pregnancy Registry product, concerning a female patient with no pertinent medical history and no known allergies who in March 2009, was vaccinated IM with the first 0.5 ml "standard dose" of GARDASIL (lot number not reported). In May 2009 the patient was vaccinated IM with the second 0.5 ml "standard dose" of GARDASIL (lot number not reported). There was no concomitant medication. Subsequently the patient became pregnant. The last menstrual period (LMP) was 01-JUN-2009. A home pregnancy test was performed. The physician saw the patient on an unspecified date. The patient's outcome was not reported. Follow-up information has been received from the physician reported that the patient decided to terminate her pregnancy in the first trimester of 2010. Upon internal review, abortion was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Areflexia, Asthenia, Ataxia, Autonomic nervous system imbalance, Balance disorder, Bradycardia, Dizziness, Epistaxis, Feeling cold, Fluid intake reduced, Flushing, Guillain-Barre syndrome, Headache, Hyporeflexia, Immunoglobulin therapy, Leukocytosis, Muscle atrophy, Muscle contractions involuntary, Muscular weakness, Polyneuropathy, Pyrexia, Somnolence, Tachycardia, Tremor, Vertigo, Vomiting

Symptom Text: Information has been received from a physician concerning a 10 year old female with a history of drug intolerance to UNASYN, unilateral small kidney and vesicoureteric reflux who on 15-JAN-2009 was vaccinated with GARDASIL (lot # 0719X), there was no concomitant therapy and there was no preexisting illness. On 26-JAN-2009 the patient experienced cephalea, dizziness, vomiting and febricula and was hospitalized to receive intravenous fluids since she was intolerance to oral fluids. On 27-JAN-2009 the patient recovered from the event of febricula. Subsequently patient recovered from cephalea and vomiting. The patient was released from the hospital 1 day later. On 30-JAN-2009 the patient persisted with the symptoms, was evaluated by a neurologist who at physical exam finds general tremor, ataxia and loss of balance. Was hospitalized again and received treatment with dexametasone. On 31 Jan 2009 the patient presented loss of distal strength. The nerve conduction study reported a polyneuropathy compatible with Guillain Barre Syndrome. The patient presented signs of autonomic dysfunction given by facial flushing and coldness. She was treated with gamma globulin. The patient's Guillain Barre Syndrome persisted. The reporter felt that the cephalea, dizziness, vomiting, Guillain Barre Syndrome and febricula were related to therapy with GARDASIL. On 5-Feb-2009 the physician reported that until 4 Feb 2009 the loss of strength in extremities had progressed and the reflexes disappeared. The pulmonary capacity maintained preserves, the patient had not present autonomic dysfunction anymore, and there had not been sensibility or cranial nerves compromise. The patient had always been aware. From 4-Feb-2009 the patient started to recover the strength until 45 grades in lower limbs, better distal strength in lower and upper limbs, and her reflexes reappeared. On 6-Feb-2009 the physician reported the patient presented on 5-Feb-2009 with signs of autonomic dysfunction given by transient dizziness, tachycardia and bradycardia. The pati

Seriousness: HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abdominal pain, Chlamydia test negative, Pelvic inflammatory disease, Pneumoperitoneum, Uterine disorder

Symptom Text: Information has been received from a gynecologist concerning a female who on an unspecified date was vaccinated with her first dose of GARDASIL. The patient had been laparoscoped by the reporter and presented with persistent abdominal pain coming shortly after the vaccination. The laparoscopy revealed widespread Pelvic Inflammatory Disease. Her right tube and ovary completely buried in adhesions and she had severe uterine serosal adhesions. Cervical STD swabs had returned negative. At the time of the report, the outcome was not provided. In follow-up, the gynecologist indicated that in August 2008, November 2008 and February 2009, the 19 year old patient received the first, the second and the third doses of GARDASIL (lot # not reported) respectively. It was reported that the patient experienced abdominal pain shortly after the third dose of GARDASIL. An ultrasound in September 2009 revealed free fluid in pelvis; containing septations and internal echoes consistent with pelvic inflammatory disease. On 18-NOV-2009, the patient was diagnosed with PID and was hospitalized. On 18-NOV-2009, a diagnostic laparoscopy revealed widespread filmy adhesions from anterior uterine fundus to bladder and lower pelvic wall peritoneum. Distal end of right tube completely buried with ovary along the right pelvic wall. Further filmy adhesions in Pouch of Douglas from uterus to posterior peritoneal wall. A band adhesion from proximal end of left tube to pelvic wall otherwise left tube and ovary looked relatively unscathed with healthy appearing fimbria and a healthy appearing ovary. The patient developed a Litre pneumoperitoneum. Satisfactory view were obtained via camera. Fluid was aspirated from Pouch of Douglas and forwarded from microbiology including Chlamydia. STD, cervical and high vaginal swabs taken. Vicryl Rapide to suprapubic and subumbilical incisions following peri-incisional Marcaine infiltration was done. The cervical swabs were negative for chlamydia and the patient was in monogynous sexual relationship. The reporting

Other Meds: Unknown

Lab Data: ultrasound, ?? Sep 09, consistent with PID; laparoscopy, 18 Nov 09, revealed widespread pelvic inflammatory disease, see narrative; cervical smear, 18 Nov 09, cervical STD swabs negative

MedDRA PT Autism, Condition aggravated

Symptom Text: Information has been received from an article on the internet concerning GARDASIL. It was reported that "GARDASIL gave the silent faces of autism a voice". The internet article reported that "many parents of autistic children who regressed after vaccination episode, the mild, moderate, and supposedly "rare" side effects of vaccinations resemble post-vaccinal symptoms manifested by their child." At the time of this report, the patients' outcomes were unknown. Attempts to verify the existence of an identifiable patient have been unsuccessful. Upon internal review, worsening autism was considered to be an other important event. This is one of several reports from the same source. No further information is available.

Seriousness: HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Contusion, Convulsion, Eye injury, Face injury, Fatigue, Muscle spasms, Urinary incontinence

Symptom Text: First dose of GARDASIL was received on 12/22/09. No known side effects. Second dose received on 02/26/10. On 03/17/10, my daughter stated she was very tired after eating dinner. She went to the couch to take a nap. Approximately 20 minutes later, she was found on the floor with severe trauma to her face. Urine was on the couch, but more was on the floor where she was found. Although nobody witnessed the event, we all believe she had a seizure. There is no family history of seizures. She has suffered severe injuries to her left eye, large knot over her left eye, and bruising over her entire face, under her chin and behind her ears. She was immediately taken to the ER by ambulance. While in the ER, she complained of her legs spasming. Numerous tests were done, all of which-blood work, EKG, CT scan-came back fine. Today, 3 days after this event, my daughter is still very tired. My daughter is a perfectly healthy, active child who has never had any medical problems until now. After reading numerous reports from other parents who had their child receive GARDASIL, I am convinced this must be the culprit. Nothing else has changed in her life besides receiving this shot.

Other Meds:

Lab Data: All blood work, cat scans, EKG, etc have to date come back normal. No drugs or alcohol in her system the night of the event. Appointment with neurologist has been set for Wednesday, March 24, 2010.

History: None

MedDRA PT Inappropriate schedule of drug administration, Rash

Symptom Text: Information has been received from a physician who learnt from his colleague that a 34 year old female with acne who in February 2010, was vaccinated with her first dose of GARDASIL. Concomitant therapy included sulfamethoxazole/trimethoprim. 3 days after her first dose, the patient experienced rash on her face and upper body. She saw a doctor for her rash and got better but subsequently her rash worsened and she was hospitalized. She was reviewed by the dermatologist who commented that the rash may be due to allergy to GARDASIL or sulfamethoxazole/trimethoprim. The final conclusion from dermatology was that the rash is due to allergy to GARDASIL. Further information will be provided once available.

MedDRA PT Convulsion, Immediate post-injection reaction, Syncope

Symptom Text: Information has been received from a medical assistant concerning a 21 year old female patient with sulfonamide allergy, and no pertinent medical history, who on 13-JAN-2010, was vaccinated intramuscularly with the first 0.5 mL dose of GARDASIL (lot number not reported). There was no concomitant medication. On 15-MAR-2010, the patient received intramuscularly the second 0.5 mL dose of GARDASIL (lot number not reported). On 15-MAR-2010, immediately after receiving the second dose, the patient "fainted and had a seizure". The patient was referred to the Emergency Room for evaluation. Computerized tomography of head performed on 15-MAR-2010 was negative. It was not known if the patient was admitted to the hospital. The patient's outcome was unknown at the time of reporting. Upon internal review, seizure was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Activities of daily living impaired, Anxiety, Chest discomfort, Dizziness, Eye pain, Fatigue, Muscular weakness, Myalgia, Nausea, Palpitations, Panic attack, Paraesthesia, Suicidal ideation

Symptom Text: heart pounds, chest tightness, dizzyness, nausea. I thought I was having panic attacks. experienced extreme fatigue and muscle weakness. Hospitalized 9/15/2009 because I was suicidal because I grew tired of living this way. I was put on an anti-depressant (Lexapro), which has helped a little with anxiety (which I never had until after Garadasil adverse side effects). It is now 3/28/10, and I experience tingling sensation in my legs almost constantly and sometimes in my lower arms. My chest is tight, and my muscles ache. I still have symptoms that feel like panic attacks, but the worst would be the fatigue. My eyes hurt, and pre-med major is difficult when so exhausted (let's not forget the difficulty of working full-time as well, as I am an independent student). Since Gardasil, my life has become hell at a time when I should be in my prime.

Other Meds: None before Gardasil. After Gardasil, tried tranquilizer..didn't help. Following hospitalization, on Lexapro and currently switching to Paxil (minor anxiety relief).

Lab Data: Lab tests in hospital came back "normal," but so have numerous other girls who suffer the same condition.

History: None.

MedDRA PT Cystitis, Drug exposure during pregnancy, Premature baby, Premature labour, Small for dates baby

Symptom Text: Information has been received via the Merck pregnancy registry, from a physician concerning a 15 year old female patient, who on 13-JUN-2007 was vaccinated with the first dose of Gardasil (Lot #655620/0171U). There was no concomitant medication. After receiving the vaccination (date not reported), the patient learned that she was pregnant (date of LMP and estimated date of delivery not reported). Follow up information received from the physician, via a company representative, indicated that the pregnancy resulted in a premature birth (date and gestational week not provided). The infant (gender not specified), also was "a low birth weight baby" (weight not specified). At the time of this report, the outcome and details of premature birth and low birth weight baby were unknown. No further details were provided. Additional information has been requested. This is in follow-up to report (s) previously submitted on 12/14/2007. Initial and follow-up information has been received via the Merck pregnancy registry, from a physician concerning a 15 year old female patient with an allergy to Penicillin, who on 13-JUN-2007 (also reported as March 2007) was vaccinated with the 0.5mL first dose of GARDASIL (Lot #655620/0171U). There was no concomitant medication. After receiving the vaccination (date not reported), the patient learned that she was pregnant (date of LMP and estimated date of delivery not reported) (also reported that the patient became pregnant in January 2007). Follow up information received from the physician, via a company representative, indicated that the pregnancy resulted in a premautre birth (date and gestational week not provided). The infant (gender not specified), also was "a low birth weight baby" (weight not specified). At the time of this report, the outcome and details of premature birth and low birth weight baby were unknown. It was reported that "everything is ok." The patient was hospitalized when she had the baby for a little over one day. No further details were provided. Fol

MedDRA PT Myelitis transverse, Quadriplegia

Symptom Text: Information has been received from a company representative who overheard a physician mention information concerning a patient who on an unknown date was vaccinated with a dose of GARDASIL (route, dose and lot number not provided). On an unknown date, the patient experienced "transverse mellitus" after getting GARDASIL which resulted in quadriplegia. The patient's outcome was unknown at the time of reporting. Upon internal review, myelitis transverse and quadriplegia were considered to be an other important medical event. This is one of two reports from the same source. Additional information is not expected.

MedDRA PT Erythema nodosum

Symptom Text: Information has been received from a gynecologist. This case is linked with case E2008-06930 (WAES # 0807USA04141) (Same source, same vaccine). A female (age unspecified) with no relevant medical history and no treatment had received a first dose of GARDASIL ((dose, duration, and lot number not reported) on an unspecified date in 2008. Less than 2 months after vaccination, the patient presented with erythema nodosum and was hospitalized. She did not receive any other injection of GARDASIL. At the time of reporting, the outcome was not specified. No further information expected. Other business partners numbers include: E2010-02448. No further information is available.

MedDRA PT Arachnoid cyst, Areflexia, Asthenia, Blood test normal, Body temperature normal, Cyst, Electroencephalogram, Fatigue, Full blood count normal, Gait disturbance, Guillain-Barre syndrome, Headache, Hypoaesthesia, Immunoglobulin therapy, Impaired driving ability, Lumbar puncture, Malaise, Metabolic function test, Muscular weakness, Myalgia, Nausea, Paraesthesia, Sensory disturbance, Sinusitis, Ultrasound bladder

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act concerning an 18-year-old female patient who on 17-JUN-2008 was vaccinated with a first dose of GARDASIL (lot # 660391/0063X) via intramuscular route into her right arm. Concomitant vaccination included the first dose of MENACTRA (lot # U2571AA) via intramuscular route into her right arm. On 11-AUG-2008, the patient experienced intolerable head/muscle pain, and muscle weakness "all over" arms. She also had "legs difficulty walking" and nausea. 911 was called and the patient was sent to emergency room for CT scan and was hospitalized. Her CT scan result was normal. Bloodwork and West Nile virus antibody test were performed with normal results according to her mother. On an unknown date, the patient was back to home with diagnosis of "possible viral infection". On 21-AUG-2008 the patient was weakness at doctor visit. She had a headache scaled 7; her not feeling well continued. The patient was sent to a neurologist emergency room for MRI scan and spinal tap. The patient also had electroencephalogram (EEG) on an unknown date. Results of MRI, spinal tap and EEG were not reported. Guillain-Barre Syndrome was diagnosed. On 26-AUG-2008, the patient was improving. The events required ER visit and hospitalization were considered to be serious. The original reporting source was not provided. The VAERS ID # is 323863. Additional information was obtained on request by the Company from the FDA under the Freedom of Information Act. Initial information has been received from a Registered Nurse (R.N.) concerning the female patient (also reported as 19 year old) who on 17-JUN-2008 was vaccinated with the first 0.5 ml dose of GARDASIL on 17-JUN-2008 (lot# 660391/0063X) along with concomitant vaccine of MENACTRA. On 11-AUG-2008 the patient experienced fatigue and walking problem. The patient was hospitalized from 21-AUG-2008 to 24-AUG-2008 and on 24-AUG-2008 the patient was diagnosed with Guillain Barre

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Activities of daily living impaired, Asthenia, Cognitive disorder, Convulsion, Fatigue, Gastrointestinal disorder, Loss of consciousness, Migraine, Nausea, Ovarian cyst, Pain, Rash, Skin lesion, Weight decreased

Symptom Text: My daughter received the GARDASIL vaccine in June of 2008 -only one of the three injections-and has been chronically ill for two years. Enough to be unable to attend school her freshman and sophomore year. She had severe gastro-intestinal issues early on -losing 20 pounds. Suffered with nausea 24/7 for eight months along with pain throughout her body, severe weakness, fatigue, seizures, cognitive issues, lapses in consciousness and outbreaks of facial lesions. She has improved over time but continues to suffer with the painful skin lesions -unless she takes VALTREX daily-, severe migraines -treating with neurologist, pain specialist and biofeedback doctor- and reoccurring ovarian cysts to which she has lost one of her ovaries at just 16 years old. PLEASE STOP THIS VACCINE. DOCTORS DO NOT KNOW HOW TO HELP THESE GIRLS. My daughter was extremely healthy prior to this - she rarely visited the doctor, athletic, active. This vaccine has changed her life.

Other Meds:

Lab Data: We have been to over 30 doctors. No one can help and most all tests come back normal - blood work, CAT SCANS, MRIs, etc. She did lose her ovary due to very large cyst and has had second surgery 6 months later for another ruptured cyst on th

MedDRA PT Abdominal pain, Back pain, Blood immunoglobulin G, Cranial nerve disorder, Eye pain, Gastrointestinal disorder, Hypoaesthesia, Laboratory test abnormal, Nausea, Neuromyelitis optica, Optic neuropathy, Pain in extremity, Rash, Spinal cord injury thoracic, Vaccine positive rechallenge, Visual acuity reduced, Vomiting

Symptom Text: This report was identified from a line listing obtained on request by the company from the FDA under the Freedom of Information Act. On 15-MAR-2007, a 13 year old female patient with eczema and a history of constipation and Raynaud's phenomenon and no pre vaccination illness was vaccinated with the first dose of GARDASIL. On 07-MAY-2007 the patient was vaccinated with the second dose of GARDASIL. On 14-SEP-2007 the patient received the third dose of GARDASIL. The patient experienced rashes after three vaccinations separately on 20-MAR-2007, 26-MAY-2007, 24-SEP-2007 and 27-NOV-2007. In February 2008 while on vacation the patient developed pain and decreased vision in left eye. MRI demonstrated enhancing lesion in left optic nerve, neuraxis. It was diagnosed as neuromyelitis optica (NMO). Three weeks ago the patient also had intermittent episodes low back pain and hospitalized for severe impaction. On 20-FEB-2008, the patient experienced left optic neuropathy and was treated with prednisone. Test was positive for NMO IgG. On 28-FEB-2008, MRI brain scan was performed to determine damage to optic nerve. On 27-MAR-2008 the diagnosis of NMO from clinic was known. Treatment with ritiximab was discussed. On 10-APR-2008, MRI thoracic spine was performed and discovered lesion. On 14-APR-2008 chest x-ray was performed (not result provided). On 16-MAY-2008, the patient experienced leg pain and numbness. On 20-MAY-2008 hospital visit confirmed diagnosis of NMO. On 15-JUN-2008 and 17-JUN-2008, the patient experienced back pain, numbness in right leg and stomach numbness. On 18-JUN-2008 MRI was performed and thoracic spinal lesion was confirmed. SOLU-MEDROL 1000 mg was taken. On 22-JUN-2008 the patient had back pain, numbness right leg and stomach numbness again. MEDROL tablet was started. On 14-JUL-2008 MRI thoracic follow up was performed (no result provided). On 20-AUG-2008 the patient experienced back pain. MRI was performed and the result noted thoracic lesion. On 06-OCT-2008, 07-OCT-2008 and 27-OCT-2008 the patient had ba

MedDRA PT Collagen disorder, Immune system disorder

Symptom Text: Please read the email I sent an official at the FDA this past October concerning the GARDASIL vaccine. In which no action has taken place. As I stressed during our conversation the FDA is limited to take certain actions by law. The office has the responsibility to contact the agency and address these issues with the secretary immediately. If the FDA can unleash a vaccine so powerful that we cannot get our children help then the FDA has a major problem on their hands. This vaccine did not have adequate testing and I am demanding the agency to contact and address this agency immediately for a solution. I don't care if this is standard protocol or not. I don't care if the agency hires a hundred scientist, doctors, and chemist, but our children will get the help they rightly deserve. If our doctors are not smart and experienced enough to diagnose our kids then maybe you should take this vaccine off the market. Its not just my daughter suffering please get to website and you will get a full ideas of how many children are sick and thats not even the full extent of how many children have been injured around the world. I'm also in the process of retrieving contact information in order for the FDA to contact her to discuss the immune disorders during the clinical trials. Merck has been allowed to market this drug falsely and should be held accountable for their actions. No one commercial states the side effects that occurred during the clinical trials for example, arthritis, Guillian Barre Syndrome, thrombosis and more which clearly states this information in their insertion letter given after the shot has been injected. This dose not even touch the side effects which haven been reported in VAERS, but Merck should be held accountable for stating the truth in the T. V. commercials. My daughter along with all these other little girls should NOT have to suffer for over two years and carry the mental and physical burden of a diagnosis "unknown". If the agency can hold a special meeting and send my relatives overseas and fight

MedDRA PT Apgar score normal, Continuous positive airway pressure, Drug exposure during pregnancy, Intensive care, Laboratory test normal, Premature baby, Respiratory distress, Retinal disorder, Small for dates baby

Symptom Text: Information has been received from a medical assistant concerning one of twin babies. The baby's 18 year old mother was vaccinated with the first and second 0.5 ml dose of GARDASIL by different provider and was vaccinated IM with the third 0.5ml dose of GARDASIL (lot #: 659962/1740U) on 01-DEC-2008. The mother's last menstrual period was 19-NOV-2008 and estimated delivery date was 05-SEP-2009. The medical assistant reported that the baby was born about 1 month early, in approximately August 2009, but as far as she knew, the baby was born normal and healthy. Follow-up information was received from a pediatrician via medical records. It was reported that the mother delivered twin babies (one male and one female) on 13-JUL-2009. The baby girl was born on 13-JUl-2009, 32 2/7 weeks of gestation via C-section for breech position. The baby was transferred to neonatal intensive care unit (NICU) for 18 days, and on continuous positive airway pressure (CPAP) for three days. Active medications included vitamins (unspecified) (POLY-VI-SOL) 0.5 ml PO BID. On 13-AUG-2009, the baby's weight was 5 pounds, 15 ounces, length was 18.5 inch, and head circumference was 13 inch. Her body temperature was 98, pulse was 136, and respiratory rate was 40. Physical examination showed the baby was alert, premature and active. The assessment was the female baby was one month old, premature, was doing well, and breech of birth. The baby continued diet Neosure 22 kcal/ounce and vitamins (unspecified) (POLY-VI-SOL). An ultrasound for hips was scheduled. Barlow and Ortolani tests were negative. The baby would be arranged "for syringes, monthly injection". On 04-SEP-2009, the baby had hip click alignment check. Ultrasound infant hips with physician guided was performed which showed both hips were within normal limits. The mother's experience has been captured in WAES # 0904USA01164. The twin baby's experience has been captured in WAES # 0904USA01164B2. Additional information has been requested. All available medical records will be provided upon r

MedDRA PT Blood test, Central venous catheterisation, Convulsion, Impaired driving ability, Impaired work ability, Laboratory test, Metabolic function test, Sinusitis, Syncope

Symptom Text: Information has been received from a consumer concerning her 21 year old daughter with no pertinent medical history and no known drug allergies who in March 2008 and May 2008 was vaccinated with a first and second doses of GARDASIL respectively (lot # not reported). Concomitant therapy included birth control medicine (unspecified). The consumer stated that the day after the second dose of GARDASIL in May 2008, the patient went to her internship/work and the mother was called because the patient fainted. She was taken to the unspecified emergency room and released. She again fainted at her internship/work and was taken to emergency room, where she had 8 witnessed seizures and was discharged with a diagnosis of a sinus infection. She then attended a barbeque, where the host called the mother to tell her that patient had a full blown seizure, not a fainting episode. She was then admitted to the hospital for 6 days with multiple tests done (metabolic test, blood test and many others, results not provided). The infectious disease physician suggested that the seizure activity may be related to GARDASIL injection. Patient was discharged to home, with intravenous access (peripherally inserted central catheter (PICC) line) for antibiotic therapy and placed on KEPPRA for anti-seizure therapy. She lost her internship, and had not been able to drive for the past two years. She had not had a full blown seizure but she can "feel them coming on". At the time of the report, the patient had not recovered from the seizure. The outcome of the sinus infection was unknown. The consumer also noted that the patient has a twin sister (unknown whether the twin was vaccinated with GARDASIL). Additional information has been requested.

MedDRA PT Pruritus, Rash erythematous, Rash papular, Varicella post vaccine

Symptom Text: Information has been received from a physician concerning a female patient who on 29-APR-2009 was vaccinated subcutaneously with 0.5 ml of the second dose of VARIVAX (Merck) (Lot:663546/0125Y). On the same day the patient received VAQTA (MSD) (lot # 663548/1604X), intramuscularly in her left arm, GARDASIL (MSD) (lot # 661846/1312X), MENACTRA and ADACEL. On an unspecified date the patient presented to the office with a diagnosis of chicken pox located behind her one ear. At the time of reporting, on 05-MAY-2009, the patient's chicken pox persisted. Follow-up information was received from registered nurse who reported that on 05-MAY-2009 experienced a rash and first noticed it behind her ears, now on her stomach and her arms. The rash behind her ear was a fine red rash. The patient developed a papular rash scattered at her thorax and extremities. The nurse suggested to keep her skin clean and dry and the patient took BENADRYL for pruritus. The patient was given hydrocortisone for behind her ears only. The outcome of the patient was unknown. No further information is available.

MedDRA PT Activities of daily living impaired, Arthralgia, Chest pain, Dizziness, Dyspnoea, Fatigue, Headache, Muscular weakness, Myalgia, Nausea, Neuralgia, Neuropathy peripheral, Posture abnormal, Skin burning sensation

Symptom Text: My daughter was given the first GARDASIL vaccine on 4/23/09 and the very next day began having adverse reactions. She started off with symptoms of nausea, dizziness, headache, and fatigue. As the days passed, she began experiencing muscle weakness so extreme that she could not hold her own head up, muscle aches, joint pain, nerve pain to feet and legs, burning skin, chest pain, shortness of breath. She was diagnosed with peripheral neuropathy by a pediatric neurologist that stated that this was a direct result of the GARDASIL vaccine. She has had countless test including, CT scans, MRI's, blood draws, ER visits and specialist visits. It is not one year past the first vaccine and my once healthy daughter continues to have dizziness, fatigue, chest pain, intermittent muscle weakness, chronic fatigue. This vaccine has effected her ability to go away to college because she cannot live in a dormitory situation because her body is not healthy enough to withstand the required meningitis vaccine. This vaccine has destroyed the life of a once healthy girl. The good the vaccine does is not enough to out way the harm when you are the one that has been harmed!!!! This is a bad vaccine. It is destroying the lives of healthy young girls. Do something!

MedDRA PT Abdominal pain upper, Alopecia, Asthenia, Chest pain, Fatigue, Gastrointestinal disorder, Nausea, Oedema peripheral, Oligomenorrhoea, Pain, Pain in extremity, Swelling face, Vomiting

Symptom Text: Information has been received from a consumer's mother concerning a 15 year old female with penicillin allergy who on 14-OCT-2008 was vaccinated with the first dose of GARDASIL (lot # 659964/1978U) on her right arm, on 29-DEC-2008 with the second dose (lot # 659964/1978U) on the left arm, and on 14-JUL-2009 with the third dose (lot # 659964/1978U) on her right arm. Concomitant therapy included gabapentin, nortriptyline and omeprazole. On 14-OCT-2008 the patient experienced weakness, tiredness, chest pain, swelling on face and hands, hair loss, leg pain, menstrual cycle lasting a month, and could not keep food down. The reporter stated she had taken her daughter to see a specialist. It was reported that her "daughter still could not hold any food down and her stomach still hurts". CT Scan, Blood work, MRI, Nerve Conductions Test, PMG and Spinal Tap was performed and "all her tests (unspecified) came out negative". The patient's physician stated that patient was still experiencing feelings of nausea and her stomach still hurt, he ruled out a problem with her gallbladder. He was referring her to a Gastrointestinal Specialist for an endoscopy. The physician also reported that patient was diagnosed with Amplified Pain Syndrome. The patient required hospitalization or prolonged. The patient had not recovered at the time of report. The events of "weakness, tiredness, chest pain, swelling on face and hands, hair loss, leg pain, menstrual cycle lasting a month, could not keep food down, her stomach still hurts, amplified pain syndrome and nausea were considered to be disabling by the patient's mother. Follow up information received a medical assistant who took this call but asked the questions of the physician who was in the background. According to the medical assistant, the GARDASIL vaccinations were given elsewhere (no details in the chart). Regarding the concomitant medications (gabapentin 600mg TID, nortriptyline 10mg taken at night, and omeprazole 40mg once a day) listed by the consumer, the medical assistant said t

MedDRA PT Abnormal behaviour, Activities of daily living impaired, Bipolar disorder, Brain injury, Convulsion, Increased appetite, Insomnia, Malaise, Narcolepsy, Pain, Vomiting

Symptom Text: Information has been received from a consumer via TV, concerning on an unspecified age consumer's daughter who from 2007 to 2008 was vaccinated with a series of GARDASIL (route and lot number not reported). The mother was claiming her daughter suffered from seizures and got brain damage after getting the vaccination. It was reported that has been sick for the past three years with uncontrollable vomiting and seizures that left her brain damaged. The mother reported that shortly after, the patient reportedly went from being a happy, honor-roll student to a completely different person. The mother said that the doctor told her that her daughter's condition was behavioral, not medical. "They had put her on psych meds, thinking she was bi-polar or something like that.", but the mother was convinced that the injections were to blame. According to the mother, her daughter needed constant care. She said the refrigerator was locked because she has urges to eat constantly. It was reported that her daughter was narcoleptic during the middle of the day, could not sleep at night and was in constant pain. The patient said she wanted to go back to school but she could not. At the time of the report the outcome of the patient was unknown. Can not go back to school and she needed constant care were considered to be disabling. Upon internal review, seizures and brain injury damage were determined to be an other important medical event. No further information is available.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Anaemia, Drug exposure during pregnancy, Nausea, Ovarian cancer

Symptom Text: Initial report was received from a health care professional on 24 September 2009. A 15-year-old pregnant female patient had received a 0.5 mL intramuscular left deltoid injection of ADACEL, lot number C2773AA, and a 0.5 mL intramuscular left deltoid injection of HPV vaccine (manufacturer Merck, lot number 0653X) and a intranasal dose of FLUMIST (manufacturer MedImmune, lot number 500687P) on 17 September 2009. The vaccine was administered by a school nurse and it was unknown at the time of the vaccination that the patient was pregnant. The patient had no pre-existing medical conditions and no prior pregnancies. Her last menstrual period occurred on 01 August 2009 and her expected date of confinement was 09 May 2010. At the time of report, the patient had not experienced any adverse events since vaccination. Follow-up information was received 19 March 2010 from a health care professional. From new information received, it was reported that the patient had received ZOFRAN 4mg since 28 September 2009 for "ovarian carcinoma refractory (nausea)". Based upon this new information, this case has been upgraded from nonserious to serious. Additional maternal drug exposures included Iron 325mg beginning 16 December 2009 for anemia, and supplemental prenatal vitamins beginning 28 September 2009. The patient's last menstrual period occurred on 02 August 2009 (previously reported as 01 August 2009). Significant medical conditions were reported as "teen, anemia" and the patient was also noted to have had a family history of diabetes and HTN (hypertension). Prenatal tests included alpha feto protein on 18 November 2009 and an ultrasound on 23 December 2009, both with normal findings. An outcome was not reported for the event of ovarian carcinoma refractory nausea and anemia. Documents held by sender: None.

Other Meds: Prenatal vitamins; ZOFRAN; Iron

Lab Data: 18/Nov/2009: Alpha Feto Protein (normal); 23/Dec/2009: Ultrasound (normal)

History: Pregnant, LMP date: 02/AUG/09 Sex: Female. The patient had no previous pregnancies. From information received on 19 March 2010, the patient had a family history of diabetes and HTN (hypertension).

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a licensed visiting nurse for GARDASIL, a Pregnancy Registry product, concerning a 17 years old female with some unspecified hypertension medication allergies and a history of normal pregnancy who on 01-JUN-2009 was vaccinated IM with the first 0.5 ml dose of GARDASIL (lot number 661841/0653X) while she was pregnant. Concomitant therapy included VARIVAX (lot number 662373/0417Y), 0.5 ml, SQ on 01-JUN-2009. Other concomitant therapy included meningococcal vaccine (unspecified) and DTAP and BACTRIM for urinary tract infection on 01-JUN-2009. On 01-JUN-2009 a pregnancy test was conducted but the test was negative. No adverse reactions reported. Phone call was made for medical attention on 25-JUN-2009. The patient was referred to an obstetrician. The patient's LMP was 29-MAY-2009 and the EDD was 5-MAR-2010. At the time of the report, the patient's outcome was unknown. Follow up information was received from a nurse practitioner. It was reported that the 17 year old patient had one previous full term delivery. It was unknown if there were any birth defects or infant complications with her previous pregnancy. Follow up information was received from a nurse practitioner. It was confirmed that LMP for the pregnancy was 29-MAY-2009 and the patient did have a positive pregnancy test on 25-JUN-2009. On approximately September 2009 ("may be in the fall"), the patient had a miscarriage. The reporter did see the patient on 12-DEC-2009 and the patient reported that her LMP at that visit was 24-NOV-2009, so the miscarriage was prior to that time. The patient was not pregnant at the December visit. The patient did not have a history of prior miscarriage and does have a 2 year old child. It was also reported that the patient did not have a history of drug abuse. It was not known who the patient saw for her pregnancy care. No further information is available.

MedDRA PT Asthenia, Ataxia, Back pain, Balance disorder, Hypoaesthesia, Muscular weakness, Musculoskeletal stiffness, Myelitis transverse, Neck pain, Nystagmus, Pain, Paraesthesia, Paralysis, Pneumonia mycoplasmal

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. On 08-AUG-2007, a 21 year old female patient with ampicillin and amoxicillin allergy was vaccinated intramuscularly with the first dose of GARDASIL (lot#0469U) into the right arm. Concomitant therapy included BACTRIM. 55 days later, on 02-OCT-2007 the patient awoke in the morning with severe neck and upper back pain. She developed numbness and tingling from shoulders down and then quickly turned into weakness then paralysis from shoulders down. She went to emergency room and was diagnosed clinically with T4 transverse myelitis. On 02-DEC-2009, DC summary and hospital records received for date of service from 02-OCT-2009 to 08-OCT-2007: patient awoke on morning of 02-OCT-2009 with stiff neck, shooting pain down both arms and progressive weakness of bilateral upper extremities. She was admitted to hospital and was treated with steroids with initial improvement of left upper extremity weakness. She developed gait ataxia during hospital stay which also improved by discharge. She was diagnosed with mycoplasma pneumoniae and infectious disease consult obtained, she was treated with antibiotic. Right upper extremity significant weakness remained. She discharged home to continue physical therapy as outpatient. Doctor diagnosis was: transverse myelitis, positive mycoplasma in serum with cerebrospinal fluid (CSF). On 02-DEC-2009, neurology records received for date of service: 12-OCT-2007, 20-NOV-2007, 10-AUG-2008, 01-JAN-2008, 15-FEB-2008, the patient presented with continued numbness of left leg with loss of pain and temperature sensation; persistent weakness of right arm. She was diagnosed with transverse myelitis, mild lateral gaze nystagmus. On 07-DEC-2009, neurology consult received for the date of service 02-DEC-2009, the patient was diagnosed with transverse myelitis, she had full movement of affected arm with continued weakness, and she had no pain. She had numbness of left leg to pa

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Asthenia, Autoimmune thrombocytopenia, Blood test abnormal, Contusion, Cough, Diarrhoea, Epistaxis, Fatigue, Feeling hot, Haematochezia, Headache, Hypoaesthesia, Idiopathic thrombocytopenic purpura, Immunoglobulin therapy, Injection site pain, Lip disorder, Oral contraception, Paraesthesia, Paralysis, Petechiae, Rash, Sensation of heaviness, Thrombocytopenia, Upper respiratory tract congestion

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Act. On 25-SEP-2009, a 25 year old female was vaccinated in the right arm with the first dose of GARDASIL (lot number 663452/0671Y) (route unknown). Concomitant medication included TRIVORA, once daily and albuterol PRN, for seasonal and pet allergies. Two months later, on 16-NOV-2009 (also reported as 19-NOV-2009), the patient went into her doctor with petechiae (red blood dots) on her legs, excessive bruising on her legs and arms, and mouth lumps (inside lower lip). The patient took a blood lab and when the results came in, the patient was at 8,000 platelet count and told to go to the emergency room (ER) right away. Treatment (steroids alone) lasted for 2 days, and the patient had to go back to the ER, this time with arm numbness/temporary paralysis added to the issue. Treatment with a stronger medication Rho(D) immune globulin (ANTI-D) was administered, but again, two days later, the patient was back in the ER. A third treatment was administered (IVIG), and it lasted two weeks. The patient was scheduled to go back to the hospital for admission to do another dose of this. Aside from pain at the injection site for over a month, the patient had also now been diagnosed with the autoimmune disease thrombocytopenia (low blood platelets) which she had been dealing with for over a month at an aggressive level, and it showed no signs of getting better. During this condition, she has had arm numbness/temporary muscle paralysis, as well. The patient had been admitted into the hospital 3 times, and had to go back again in a few days, as she dropped again. On 23-DEC-2009, PCP medical records received. Service dates 11/19/09 to 12/21109. Included emergency department (ED) visit 21-NOV-2009. Assessment: Idiopathic Thrombocytic Purpura, Patient complained of feeling warm, fatigue, Cough, congestion, Oral contraceptive use, Hematochezia, Paresthesia, Bruising on forearms, Presents at ED with petechiae, Multiple bruises thigh

MedDRA PT Cough, Dizziness, Dry mouth, Dyspnoea, Flushing, Heart rate increased, Injection site urticaria, Urticaria, Wheezing

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Act concerning a 17 year old female with congenital hydrocephalus and a medical history of 32 week preemie and Vascular shunt who on 04-JAN-2010 was vaccinated intramuscularly into the left arm with a second dose of GARDASIL (lot # 662304/1013Y). Secondary suspect vaccination included second doses of VAQTA, (lot # 665702/1257Y), intramuscularly into the right arm and VARIVAX (Merck) (lot # 665208/1109Y), subcutaneously into the left arm. No concomitant therapy reported. On 04-JAN-2010 the patient experienced cough, dizziness, dry mouth, dyspnoea, flushing, heart rate increased, urticaria and wheezing. The patient became flushed, she complained of difficulty breathing, wheezing and developed hives on trunk and extremities required prolonged observation at physician's office. The patient was given 0.5 mL (1:1,000) epinephrine subcutaneous, BENADRYL 50 mg oral, ORAPRED 60 mg x1 dose. Medical records received from 04-JAN-2010 to 11-JAN-2010 indicated that after vaccination the patient complained of flushing face, dizziness, cough and started to complained of SOB, also experienced wheezing, dry mouth. Then the patient had hives at injection site. Assessment: Chest clear, normal voice (+) hives, HR increased, EPI PEN gave, hives decreased, lungs clear, VSS hives gone, the patient was sent home in stable condition. The listing indicated that one or more of the events was considered to be immediately life-threatening. A lot check has been initiated. The original reporting source was not reported. The VAERS ID number is: 376090-1. A preliminary lot check investigation was performed. To date our investigation has found that the lot 665702/1257Y conformed to quality release parameters and the manufacturing was typical of a lot of VAQTA. Additional information will be provided upon finalization of this manufacturing investigation. A standard lot check investigation has been finalized. All in-process quality checks for the

MedDRA PT Abdominal pain upper, Activities of daily living impaired, Cough, Dysphagia, Fatigue, Joint swelling, Movement disorder, Nausea, Oedema peripheral, Pain, Pain in extremity, Pharyngeal oedema, Rash, Rash erythematous, Rash macular, Skin lesion, Tenderness

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. It was reported that an 18 year old female patient with an unusual cough, almost asthmatic, that kind of took her breath away. This had started 3 weeks prior and a history of exercised induced asthma and kind of routine occurring sinusitis but not at the time the injections were started who on 29-DEC-2009 was vaccinated intramuscularly with the fourth dose of GARDASIL (Lot # 665607/1332Y). On 10-JAN-2010, the patient started noticing a rash on her lower legs around her ankles, kind of just little red dots. The rash kept spreading and getting worse with bigger red blotches all up and down her legs but most heavily concentrated on her lower legs and feet. So, on 15-JAN-2010 they went to the doctor about the rash, the coughing and an acheness. He didn't know what it was and did some blood work that they wouldn't find out about until Monday (this was Friday). On the evening of 17-JAN-2010, she had swollen up so bad on her lower legs and ankles that you couldn't see any of her ankle bones, etc. Also was saying that she could hardly swallow so the reporter was concerned that throat was swelling like the legs. So, the reporter took her to the emergency room. They did blood work but said nothing showed up. They started tossing out possible things like lupus and auto-immune disease. The reporter didn't think that she told the doctors there about her just having had the 3rd dose GARDASIL. They gave her 60 mg a day of prednisone for 4 days. Electronic records for 18-JAN-2010: DX: Skin rash Patient presented with c/o rash and worsening swelling of legs. The rash had a gradual onset and had started a week ago. Examination noted swelling and tenderness in bilateral lower legs. The rash was described as red slightly raised lesions, which did not blanch when touched. The patient was discharged home and given prescriptions for LORTAB. The patient was counseled to follow-up with PCP in 1-2 days as sy

Seriousness: DIED, SERIOUS

MedDRA PT Activities of daily living impaired, Condition aggravated, Convulsion, Decreased activity, Fall, Headache, Hypertension, Hypoaesthesia, Injury, Loss of consciousness, Loss of control of legs, Menstruation irregular, Oedema peripheral, Paraesthesia, Peripheral coldness, Sensory loss, Sudden unexplained death in epilepsy, Unresponsive to stimuli, Weight increased

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 13 year old female with seizure disorder that came on with her periods and a history of 36 1/2 weeks gestation and difficulties at birth. The patient had a service date on 14-AUG-2009 assessment: Frontal lobe seizures, the patient presented for follow-up visit due to recent increase in seizure activity. Significant weight gain, High blood pressure. On 25-AUG-2009 the patient was vaccinated with the first dose of GARDASIL (lot # 663452/0671Y) as well as the flu nasal spray (lot # 500673P). The patient's mother declined her the vaccination but her doctor ensured that it was safe. The patient's mother declined the same vaccination a year earlier at the downtown public health center. On 01-OCT-2009 the patient experienced convulsion, decreased activity, fall, headache, hypertension, hypoaesthesia, injury, loss of control of legs, menstruation irregular, oedema peripheral, paraesthesia, peripheral coldness, sensory loss and weight increased. The patient was getting ready for school and was standing by her closet, and all of a sudden she fell, she lost total control of her legs. She went to school and could not engage in any of the activities because of the numbness in her legs and the swelling of her foot. She also, started to get a really bad headache. Days later she woke up out of her sleep complaining of a severe headache, which usually she got if she had a seizure but she had not had a seizure this night. She continued to say that she had not feeling in her foot and tingling feeling in her leg. After the patient's mother examined her foot, she noticed that it was swollen. The next morning the doctor was called and made an appointment on 23-OCT-2009. During the month of October she had irregular periods. The patient had the following test: white blood cell count: 4.5, blood lymphocyte count: 44.3, blood monocyte count: 13.5, serum alanine aminotransferase test: 43. The patient never

MedDRA PT Hypoaesthesia, Juvenile arthritis, Mobility decreased, Sight disability

Symptom Text: Information has been received from a register nurse concerning a 12 year old female with no pertinent medical history and no known drug allergies who on 09-JUL-2009 was vaccinated IM into right deltoid with a first 0.5ml dose of GARDASIL (lot# 661953/1130X). Concomitant therapy included ADACEL, DTaP, MENACTRA, and HAVRIX. At the end of July 2009 or beginning of August 2008, the patient experienced numbness of the fingers and toes. Shortly after, the patient was diagnosed with juvenile rheumatoid arthritis sometime before school started. The patient was seeing an unspecified specialist through an office visit. At the time of the report, the patient had not recovered. Juvenile rheumatoid arthritis was considered to be disabling by the reporter because of affecting eye sight and mobility. Additional information has been requested.

MedDRA PT Convulsion, Deja vu

Symptom Text: Information has been received from a registered nurse concerning a female who on 08-JUL-2008 was vaccinated with first dose of GARDASIL (lot# 66398/0072Y valid for ROTATEQ). On 20-FEB-2009, patient was vaccinated with second dose of GARDASIL (lot# 661952/1129X) and on 18-DEC-2009, patient received a third dose of GARDASIL (lot# 662304/1013Y) and also H1N1 (cold adapted Ann Arbor master strain). No concomitant medications were reported. On 27-FEB-2010, patient went to ER with complaint of "deja vu type episodes", lasting anywhere from 30 seconds to a couple of minutes, intermittently since January 2010. On 27-FEB-2010 a CT of the head was normal. Patient was referred to a neurologist who diagnosed the patient with seizure disorder. Patient was placed on unspecified medications. At the time of reporting, the patient's seizure disorder persisted. It was reported that patient's status was "not disabling (other that the fact that patient cannot drive)". Seizure disorder was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Asthenia, Erythema, Fatigue, Flushing, Hypersensitivity, Oral allergy syndrome, Rash macular, Rash papular, Rash pruritic, Skin burning sensation, Swelling face, Urticaria

Symptom Text: Receive her first GARDASIL vaccination at 0930 on 9/30/2009. She reported history of sore throat, body aches, low grade fever, runny nose and non-specific malaise for approximately the three days preceding her vaccination for which she was using THERAFLU and throat lozenges. Symptoms had resolved by the time of vaccination. Approximately 20 minutes after receiving this shot while having her blood drawn, she noticed a small area of mildly pruritic red raised bumps (pimple size) on her left forearm. She returned to clinic and was prescribed diphenhydramine 25 mg. About 12 hours later (@2230 hr) her face (jaw line) was puffy with welts and flushed. She had scattered red rash to both arms (upper/lower). She denied any throat swelling or pain, tightness, difficulty breathing or swallowing. No lip edema, no itching. No joint/muscle pain. She took her first BENADRYL (unsure if 1 or 2 caps taken), climbed into hot bathtub of water and fell asleep. She awoke about 5 am (10 hrs after vaccination) still in the bathtub and noticed a scattered red blotchy rash to chest, abdomen, back, buttock, arms, and legs. She again denied any diff breathing, lip edema, chest pain, or dysphagia. The "hives" appeared red and flat and were not pruritic. She did c/o of feeling weak and tired, and of increased skin sensitivity/burning in area of hives. She denied any new detergents, soaps, deodorants, lotions, oils, hair products, etc. She denied any food allergies. She presented to local clinic, diagnosed with an "allergic reaction" and was treated with CYCLOCORT top lotion, oatmeal bath and prednisone (60 mg x 5d, 40 mg x 5d, 20 mg x5d). She only took one dose of BENADRYL and only 2 days of steroids before stopping as she saw no resolution of symptoms. She did note relief with CYCLOCORT and used x 2 weeks with full resolution of symptoms. She denied mucosal involvement at any time. The area of her rash remained hypopigmented with skin returning to normal color about 5 months later. The patient is known to be atopic. In March 2010 she was ev

MedDRA PT Body temperature decreased, Convulsion, Grand mal convulsion, Headache, Hypertension, Hypothermia, Loss of consciousness, No reaction on previous exposure to drug, Tonic clonic movements

Symptom Text: Case received from a consumer (patient's mother) linked to medical query 10/030. A 13 year old female patient had received a second dose of GARDASIL (Batch number NL16940, lot number NJ53460, site of administration not reported) via intramuscular route on 06-NOV-2009. On 06-NOV-2009, some minutes after the administration the patient experienced a strong headache with decrease in body temperature, loss of consciousness and convulsion with tonic-clonic movements. A nurse measured her blood pressure which was high but, a few minutes later, blood pressure was normal. The nurse also informed the patient's mother that she should contact the emergency if the patient had additional events; however, it was not necessary. The duration of the episode was unknown. The patient recovered spontaneously without hospitalization or other medical treatment. To be noted that the patient had history of asthma treated during 2 years, skin allergic reactions but no allergic reaction to other drugs. The patient received the first dose of GARDASIL which was well tolerated. For the moment, the patient's mother was considering not to administer the third dose but she would contact a physician. Headache, hypertension, hypothermia, loss of consciousness and tonic-clonic convulsion were considered other important medical events by the reporter. Other business partner numbers include: E2010-01775. No further information is available.

MedDRA PT Cough, Injection site pruritus, Pruritus, Rash erythematous

Symptom Text: Information has been received from a health authority (Case n. 113752). A 20 year old female patient was vaccinated intramuscularly with a dose of GARDASIL into her left arm on 05-MAR-2010. On the same day, about 20 minutes post vaccination, she presented with intense itching starting at the injection site, extending to the entire left arm and then to the neck, back and abdomen with non urticarial red spots. The patient was treated with TRIMETON 0.8 ml, intramuscularly after which the itching did not subside but onset of cough. Emergencies were called. The outcome was recovered on 05-MAR-2010. HA only coded injection site itching and cough. The case is closed. The agency considered itching, cough, rash and injection site itching to be other important medical events. Other business partner numbers include E2010-01795. No further information is available.

MedDRA PT Congenital anomaly, Foetal disorder, Foetal growth retardation, Foetal heart rate abnormal, Gastroschisis, Premature baby, Tachycardia foetal

Symptom Text: Information has been received from medical record concerning a female baby whose 25 year old mother smokes and has no pre-existing allergies, birth defects or medical conditions, no illness at time of vaccination and no history of previous pregnancies was vaccinated on 16-FEB-2009 was vaccinated IM in her right deltoid with the first dose of GARDASIL vaccine. Concomitant vaccination received the same day included a dose of diphtheria toxoid (+) pertussis acellular vaccine (unspecified) (+) tetanus toxoid (lot # A014). The physician indicated that her mother was pregnant at time of vaccination but it was too early to detect it. Her LMP was 26-JAN-2009, her EDD was 09-NOV-2009. From 17-FEB-2009 to 03-MAR-2009, the patient's mother took on CHANTIX to quit smoking. On 04-MAR-2009, the patient's mother had a positive urine pregnancy test. Subsequently on 18-MAR-2009 and on 20-APR-2009, two ultrasounds were done respectively to verify dates and pregnancy viability, and confirmed that vaccination occurred around conception, her estimated conception date was 16-FEB-2009 (+)/- 1 week). On 21-OCT-2009 at 5:45 am the infant's mother experienced spontaneous rupture of membranes. Her labor was induced and the infant experienced intrauterine growth restriction, baseline fetal tachycardia, loss of fetal heart rate variability and fetal gastroschisis during labor and delivery which have been captured in WAES # 0904USA01203. Fetal gastroschitis is considered a congenital anomaly. Additional information has been requested.

Other Meds: CHANTIX

Lab Data: Ultrasound, 03/18/09, EDC 11/9 + 11/7 (S<D). Confirmed vaccination occurred around conception; ultrasound, 04/20/09, EDC 11/9 + 11/7 (S<D), Confirmed vaccination occurred around conception

MedDRA PT Eye swelling, Lip swelling, Pharyngeal oedema, Swelling face

Symptom Text: Client reported adverse event to us on 03-31-10 in the pm via the State Health Center answering machine. In follow up on 4-1-10: The Client received her GARDASIL (HPV) vaccine @ approximately 1 pm on 3-25-10. Client states she felt "fine the rest of the day and evening." and went to spend the night at a friend's house (on 03/25/1020). She reports waking up at 1 AM on 3-26-10 with the following symptoms: right-sided swollen lip, cheek and eye, and a swollen throat. At approximately 4 a.m. she states she took x4 "over-the-counter" Benadryl tablets and by approximately 6 to 7 AM on 3-26-10 the swelling "started going down". At 11 A.M. on 4-1-10 client states "I feel perfectly fine now."

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Aborted pregnancy, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician for GARDASIL, a pregnancy registry product, concerning a 24 year old female with no pertinent medical history and no drug reactions/allergies who was vaccinated in June 2008 and on 11-AUG-2009 with a dose of GARDASIL. There was no concomitant medication. On 11-AUG-2009, the patient had a positive urine pregnancy test. The estimated gestational age at the time of this reporting was four weeks. The last menstruation period was approximately 12-JUL-2009 and the estimated delivery date would be approximately 18-APR-2010. The patient had sought unknown medical attention. At the time of report the patient's status was unknown. Follow-up information has been received concerning a female patient with no significant past medical history and one elective termination who in June 2008 was vaccinated with the first dose of GARDASIL somewhere else and on 11-AUG-2009 was vaccinated with the second 0.5 ml dose of GARDASIL (Lot# 659655/0940X). There were no concomitant therapies. On 21-AUG-2009 ultrasound was performed which revealed that the dating was 6 2/7 weeks. On 31-AUG-2009 the patient signed the consent form for the Merck registry for GARDASIL. Follow-up information has been received indicated that the patient aborted her pregnancy due to personal reasons. Upon internal review, the aborted pregnancy was considered to be an other important medical event. Additional information has been requested.

Other Meds: None

Lab Data: ultrasound, 08/21/09, 6 2/7 week - dating; urine beta-human, 08/11/09, positive

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Hemiplegia, Hypoaesthesia, Immediate post-injection reaction

Symptom Text: Initial and follow-up information has been received from a Licensed Practical Nurse concerning a 20 year old female with no pertinent medical history and no drug allergies who on 05-JAN-2010 was vaccinated intramuscularly in right deltoid arm with the first 0.5 mL dose of GARDASIL (LOT# 0669Y). Concomitant therapy included DEPO-PROVERA. The patient felt numbness from head to toe right after receiving the vaccine. There was no lab diagnostic study performed. She recovered few minutes later. On 29-MAR-2010, a voice mail message was received from the nurse. It was reported that the patient received no other vaccines at the time of the GARDASIL vaccination. The nurse said that according to the patient directly after receiving the first dose, the patient was paralyzed on the right side for one minute. Even though medical staff was available, the patient did not tell them of this event. Therefore no treatment was given and no referrals were made. It wasn't until the patient came in for the second dose did the staff learn of the incident. The second dose of GARDASIL was not given. Upon internal review, paralyzed on the right side for one minute was determined to be an other important medical event. No further information is available.

Other Meds: DEPO-PROVERA

MedDRA PT Arthralgia, Asthenia, Atrioventricular block second degree, Autoimmune hepatitis, Gallbladder enlargement, Hepatic cirrhosis, Jaundice, Liver transplant, Oedema peripheral, Renal failure, Waist circumference increased

Symptom Text: Information has been received from a company representative who overheard a physician mention information concerning a patient who on an unknown date was vaccinated with a dose of GARDASIL (route, dose and lot number not provided). On an unknown date, the patient experienced "transverse mellitus" after getting GARDASIL which resulted in autoimmune hepatitis, which led to renal failure and liver transplant. The patient's outcome was unknown at the time of reporting. Upon internal review, myelitis transverse was considered to be an other important medical event. Attempts are being made to verify the existence of an identifiable patient and reporter. This is one of two reports from the same source. The following information was obtained through follow-up and/or provided by the government. 07/12/10. DC summary for 02/16/09-02/20/09. Pt p/w bilateral LE edema. Liver function tests elevated, eye color changed to yellow, increased abdominal girth, weakness. CT of abdomen showed mild bilateral ductal dilation and gallbladder thickening. ECG showed second degree heart block. Liver biopsy indicated cirrhosis. DX: Cirrhosis likely secondary to autoimmune disease. Tx: ADEK, spironolactone, prednisone. 07/12/10. Consult on 03/11/09. Pt p/w joint pain in knees, ankles and wrists. Physical was exam wnl. UA showed trace protein. Pt to decrease dose of spironolactone. Tx: 6-MP. Assessment: autoimmune hepatitis. Pt was doing better. ```Review of medical records does not support the diagnosis of tranverse myelitis.

Other Meds: Unknown

Lab Data: Unknown The following information was obtained through follow-up and/or provided by the government. Labs and DX studies: CT of abdomen and chest: abnormal. PT 20 sec and PTT 37 sec increased, ANA elevated. SGPT 222 IU/L (H), total bilirubin

MedDRA PT Monoplegia, No reaction on previous exposure to drug

Symptom Text: Case received from Health Care Professional in a foreign country on 18-MAR-2010. AE received and collected in a survey conducted to identify the pattern of use of HPV vaccine made from phone call interview with users. Results of the survey were provided as a table with patient identification and AE experienced after each dose, if any. There were 4 categories of adverse reactions in which several AEs may be listed into parenthesis without specifying if the patient had experienced only one AE or all of them. A 23 year old female patient had received on unspecified date a first dose of GARDASIL (batch n., site of administration and route not reported). On unspecified date, the patient presented with immobilized arm after the first dose. Outcome was unknown. On unspecified dates, the patient received a second and a third dose of which were well tolerated. File is closed. Upon internal review, monoplegia was considered to be an other important medical event. Other business partner numbers included E2010-01983.

MedDRA PT Death, Headache, Vaccine positive rechallenge

Symptom Text: Information has been received from a nurse practitioner concerning a 13 year old female patient who on unspecified dates was vaccinated with three doses of GARDASIL at the nurse practitioner's previous practice. The patient experienced headache after getting first and second dose of GARDASIL. The patient sought unspecified medical attention. After the third dose of GARDASIL the patient experienced headache and died on the same day. The cause of death was not reported. Additional information has been requested.

MedDRA PT Fall, Head injury, Immediate post-injection reaction, Nasopharyngitis, Otitis media, Syncope, Unresponsive to stimuli

Symptom Text: Information has been received from a medical assistant and a physician concerning a 22 year old female with no medical history or drug allergies who on 01-APR-2010 was vaccinated with the first dose of GARDASIL (lot # 661954/0075Y), 0.5ml, IM. Concomitant therapy included MENACTRA and HAVRIX. The medical assistant reported that on 01-APR-2010 the patient experienced a seizure within seconds after receiving GARDASIL. The patient was taken to an emergency room and was given intravenous fluid. However, when intravenous fluid was stopped, another seizure occurred and she fell to the floor. The patient recovered on 01-APR-2010 and went home. The physician confirmed that the patient fell on her head after receiving GARDASIL. The patient went to the emergency room and was given an IV. The IV was removed and the patient got up to leave and fell on the back of her head. The patient had syncope occur twice in a 24 hour period. The patient recovered on 01-APR-2010. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested. The following information was obtained through follow-up and/or provided by the government. 4/12 and 4/21/2010 ED records for 4/1/2010 , Dx syncopal episode patient saw PCP 4/1/2010 for well child visit and vaccinations, also with c/o's cold sx, dx'd with OM, immediately after vaccination child became unresponsive for 10-15 seconds, sent to ED for evaluation

MedDRA PT Anaphylactic shock, Injection site pain

Symptom Text: Initial case was reported by a Health Care Professional. Upon internal review, the case was considered serious due to anaphylactic shock. It was reported that a 15 year old female on 31-MAR-2010 was vaccinated with GARDASIL (first dose, batch# NL30760, lot# 1334X, IM route in arm). HCP reported that the girl remained in waiting room after vaccination since she experienced pain localized to the injection site. Approximately one hour later, after leaving the hospital, she experienced anaphylactic shock. She was taken to the hospital where she was treated with BETAPRED and then remained for observation for a little while. During the winter season 2009/2010 the girl experienced meningitis and infectious mononucleosis (no details reported). At the time of the vaccination with GARDASIL, the girl was healthy. The outcome was unknown. Upon internal review, anaphylactic shock was considered to be an other important medical event. Other business partner numbers include E2010-02136. No further information is available.

MedDRA PT Convulsion, Joint hyperextension, Loss of consciousness, Post-traumatic amnestic disorder, Somnolence, Urinary incontinence

Symptom Text: Information has been received from a Health Authority under the reference number N201003-1133 on 29-MAR-2010 concerning a 13 year old female who had received a dose of GARDASIL (batch#, site of administration not reported) via intramuscular route on 05-MAR-2010. On the same day, five minutes post vaccination, she experienced convulsion with loss of consciousness, limb hyperextension and urinary incontinence. The patient recovered 20 minutes later but presented with somnolence and post-traumatic amnesia. Analytical study unchanged, research on toxics in urine negative and EKG without significant alterations. The patient was discharged with a diagnosis of favorable first seizure and send to pediatric neurology care for research. Previous adverse reactions to any drug are unknown. The patient completely recovered. Convulsion, loss of consciousness, limb hyperextension, urinary incontinence, somnolence and post-traumatic amnesia were considered to be other important medical events. Other business partner numbers included: E2010-02089. No further information is available. File is closed.

MedDRA PT Erythema multiforme, Rash

Symptom Text: This case was initially reported SPMSD by a health care professional on 30-MAR-2010. This case concerns a 14 year old female patient. The patient received dose one of GARDASIL, batch number NK31480 (lot# NJ28290), on 11-FEB-2010. On 15-FEB-2010, four days post vaccination, the patient developed a rash. The patient was seen by an "out of hours" doctor who diagnosed erythema multiforme. Treatment was initiated with antihistamines. The patient's mother confirmed that the erythema multiforme had improved dramatically by the next day. The patient was travelling the next day and was well enough to travel. At the time reporting the patient was recovering. The reporter considered the case to be serious as it was medically significant. Other business partner number include E2010-02076. No further information is available.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician for GARDASIL, a Pregnancy Registry product, concerning a 13 year old female patient who was vaccinated with the first, second and third dose of GARDASIL separately on 17-NOV-2008, 04-FEB-2009 and 04-JUN-2009. The physician did not know the patient was pregnant until an appointment in July 2009. The patient had done urinary test to confirm pregnancy. It was found out at this time the patient was pregnant for 5 months. The patient's date of last menstrual period was approximately on 01-FEB-2009 and estimated delivery date is 08-NOV-2009. Follow up information has been received indicating the patient had an elective abortion in August 2009. Upon internal review, the patient's elective abortion was considered an other important medical event. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician for the Pregnancy Registry for HPV vaccine concerning a 15 year old female with no pertinent medical history who on 12-AUG-2008 was vaccinated with the first dose of GARDASIL and ADACEL. At the time of vaccination with GARDASIL the patient was pregnant. On 02-SEP-2008, the patient came to the gynecologist office for annual physical exam and because she was missed her period, a pelvic ultrasound was performed that revealed a pregnancy of 14 weeks and 2 days. The patient's LMP was 9-JUN-2008 and EDD 16-MAR-2009. No adverse event occurred. Additional information has been received from a nurse concerning the patient. The nurse reported that the patient had a Cesarean section on 13-MAR-2009 and delivered a normal baby with "no problems", who weighed 9lbs, 13 oz. The nurse could not confirm the indication for the Cesarean. "It was possible it was due to the baby's size, but the nurse can't say for sure". The patient came back to the office at 2 weeks and 4 weeks postpartum for incision checks, but did not return for her "regular 6 week postpartum visit". The patient's incision was doing fine at the time and she was recovering from her Cesarean section. Upon internal review, Cesarean section was considered to be an other important medical event. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy, Pyelocaliectasis

Symptom Text: Case received from a child care worker through the Sanofi Pasteur MSD GARDASIL pregnancy registry on 13-NOV-2009. This case is linked with the case E2009-01419 (patient's mother). A male neonate whose mother had received the third dose of GARDASIL (batch number not reported) in January 2009 during pregnancy experienced left pyelocaliceal dilatation, as detected by prenatal ultrasound (date not reported). A renal ultrasound was performed three days after birth and showed normal right kidney and slight dilatation of the renal pelvis in the left kidney. One month after birth the ultrasound showed that dilation had diminished. The patient was born at 39 weeks. His mother had undergone epidural anaesthesia and the top of his head came first at delivery. The patient's birth weight was 3.570 kg and his birth size was 50.5 cm. His head circumference was 36 cm and he had an Apgar score of 10. The patient was reported to be normal without congenital anomaly. The patient was followed by a paediatrician. His growth was considered as normal. Upon internal review it was decided to code hepatitis B vaccine as concomitant because it was no more reported as suspect vaccine in the different questionnaire. Follow up information received by telephone on 11-MAR-2010. The paediatrician did not know the patient and might have difficulty in finding him. No further information expected. A corrective version was created on 08-APR-2010. Upon medical review, the company upgraded the case to serious: pyelocaliectasis was considered as congenital anomaly. It was noteworthy that the patient did not consider the event was a congenital anomaly. The mother's experience has been captured in WAES# 0903USA01270. Other business partner numbers include: E2009-11206.

Other Meds: hepatitis B vaccine, recomb

MedDRA PT Amnesia, Dizziness, Muscle twitching, Muscular weakness, Nausea

Symptom Text: Information has been received from the agency via a Case Line Listing via CSL, as part of a business agreement, concerning a 17 year old female patient who on 03-AUG-2009, was vaccinated intramuscularly with her second 0.5 ml dose of GARDASIL (Lot# NJ02680, batch# NJ46520). It was reported that in December 2009, < 1 year, the patient experienced nausea (severe), faintness (severe), muscle weakness (severe), twitching (severe) and memory loss (severe). At the time of the report, the patient had not recovered. The reporting agency considered that nausea (severe), faintness (severe), muscle weakness (severe), twitching (severe) and memory loss (severe) were disabling events. The relationship between nausea (severe), faintness (severe), muscle weakness (severe), twitching (severe) and memory loss (severe) and vaccination with GARDASIL was unclassified. Additional information is not expected.

MedDRA PT Clonus, Convulsion, Dizziness, Pallor, Posturing, Syncope

Symptom Text: Information has been received from a physician and a medical secretary, concerning a 15 year old female patient, with acne and allergy to AUGMENTIN and a history of anemia after a fractured femur in 2007, who on 30-MAR-2010 (also reported as "sometime last week"), was vaccinated with the first 0.5 mL dose of GARDASIL (route not provided) (lot number 662304/1013Y). Other vaccines administered the same day included VARIVAX (Merck) (dose and route not reported) (lot number 665576/1206Y). Other concomitant therapy included FINACEA and ZYRTEC. On 30-MAR-2010, (also reported as "sometime last week"), the patient experienced syncope with seizures (also reported as seizures-like activity) for less than 30 seconds. On 30-MAR-2010, the patient recovered. The patient sought unspecified medical attention. No referrals made. Upon internal review, seizure was considered to be an other important medical event. No further information is available. The following information was obtained through follow-up and/or provided by the government. 4/15/10 MR received for date 3/30/10. DX: wellness check CC: syncope with seizure after vax. pt given next dose of vax and had sycope episode again in MD office. Pt became pale, fainted and began having tonic posturing for 15 seconds. Remained pale and woozy x10 minutes.

Other Meds: FINACEA; ZYRTEC

Lab Data: Unknown

History: Anaemia; Femur fracture, Augmentin allergy

Prex Illness: Acne; Drug hypersensitivity

MedDRA PT Abdominal pain, Activities of daily living impaired, Arnold-Chiari malformation, Babesiosis, Back pain, Bone cyst, Burning sensation, Chest X-ray, Chest pain, Computerised tomogram, Deafness, Diplopia, Dysuria, Eye pain, Headache, Intervertebral disc disorder, Lumbar puncture, Muscular weakness, Nausea, Neck pain, Nuclear magnetic resonance imaging abnormal, Nuclear magnetic resonance imaging brain, Pain in extremity, Paraesthesia, Tinnitus, Urinary incontinence, Vision blurred, Vomiting, X-ray

Symptom Text: Information has been received from a physician concerning a 16 year old female with exercised induced asthma and ZITHROMAX allergies, who on 21-JUL-2009 was vaccinated intramuscularly with a 0.5 mL first dose of GARDASIL (lot # 661953/1130X). The patient was vaccinated with a second dose of GARDASIL (lot # 663453/0249Y) on 20-OCT-2009. The patient developed back pain 2 weeks after receiving her second dose. The pain increased and spread to her head, neck, chest, abdomen and legs. She was also experiencing tingling and weakness of her legs, vomiting and difficulty urinating. The patient had not been able to attend school. The patient was hospitalized twice. The physician mentioned two diagnostic findings that have been ruled out as not significant: A syrinx on brain or spine MRI and a positive IGG titer for babesiosis from blood. The patient also had renal and abdominal ultrasounds, unspecified blood tests and an unspecified urologic testing. At the time of this report the patient had not recovered. Follow up information received from a physician indicated that the patient did not receive any concomitant vaccinations when she received the dose of GARDASIL. The patient started having symptoms approximately in November 2009. The physician stated that "so far all of the patient's tests have been negative" (tests unspecified). The patient's symptoms have been scattered. There was no diagnosis at this time. The physician stated that she had spoken to the patient's mother by phone on a daily basis. Follow up information received from a physician via medical records indicated that the patient was a female with mild urinary reflux and an Achilles tendon repair in 2006. The patient's mother had urinary system issues, a sacral nerve implant, and an ovariectomy done her father had asthma, allergies and disk problems, her brother had harlequin syndrome and her sister had severe allergies and asthma. On 20-OCT-2009 the patient was vaccinated intramuscularly with a second dose of GARDASIL (lot # 663453/0249Y). The patient devel

MedDRA PT Congenital choroid plexus cyst, Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse, for GARDASIL, a Pregnancy Registry product, concerning a 23 year old female who was vaccinated with the first dose of GARDASIL on 02-MAR-2009 and vaccinated with the second dose on 07-MAY-2009. There was no medical history. The reporter stated that the patient was now pregnant, and pregnancy was normal to date. The patient's last menstrual period was on 12-APR-2009 and estimated date of delivery was 17-JAN-2010. Her estimated date of conception was 20-APR-2009. A urine pregnancy test was performed. The patient had sought medical attention at the office. Follow up information has been received from the registered nurse concerning the patient with 2 previous pregnancies (1 full term delivery at 40 weeks and 1 elective termination), no birth defects in previous pregnancies, no infant complications in previous pregnancies and prenatal care (vitamins 1 tablet daily started on 06-MAY-2009) during pregnancy who delivered a male infant on 15-JAN-2010 (at 39 weeks). The infant was reported as normal with weight of 8 pounds 1 ounce and there were no complications or abnormalities. There were no infections or illnesses during pregnancy. On an unspecified date the patient had a positive sonogram of bilateral choroid plexus cyst and echogenic focus on the bowel. Follow up for genetic counseling "ie: Amino ml 46xx-AFP>ml." The mothers experience has been reported in 0906USA02107. Additional information is not expected.

Other Meds: vitamins (unspecified), tab

Lab Data: diagnostic laboratory, positive sonogram of bilateral choroid plexus cyst; diagnostic laboratory, positive sonogram of echogenic focus on the bowel

MedDRA PT Atrioventricular septal defect, Drug exposure during pregnancy

Symptom Text: Information was obtained on a request by the Company from the agency via a Public Case Detail for GARDASIL, a Pregnancy Registry product, concerning a baby. On 10-NOV-2008, the baby's 20 year old mother was vaccinated with a dose of GARDASIL. The baby's mother's concomitant therapy included ELEVIT RDI. The baby's mother had a positive home pregnancy test on 24-NOV-2008. On unspecified date the baby's atrioventricular septal defect was found on foetal morphology scan. Amniocentesis was to be performed. The event required a specialist consultation. At the time of the report, the baby's outcome was unknown. The reporter felt that atrioventricular septal defect was related to therapy with GARDASIL. The original reporting source was not provided. The mother's experience has been captured in WAES#0907USA02109. Additional information is not expected. The event of atrioventricular septal defect was previously reported in WAES0907USA02109.

Other Meds: ELEVIT

MedDRA PT Activities of daily living impaired, Pain, Pain in extremity

Symptom Text: Information has been received from a health care worker concerning a 23 year old female patient with anxiety disorder and penicillin allergy who on 29-JAN-2009, 27-JUL-2009 and 24-MAR-2010 received the first (intramuscularly), second and third dose of GARDASIL respectively (Lot # 662300/0100Y for third dose). Concomitant therapy included clonazepam, CYMBALTA and ORTHO TRI-CYCLEN. On 31-MAR-2010 the patient called the physician's office with arm pain. The physician recommended warm compression alternating with ice, and ibuprofen. The patient's pain did not improve, so she came to the office later that day. While in the office, the physician found "no redness and nothing visible". She complained of pain in the left arm radiating into the elbow, shoulder, and chest wall. The physician continued to recommend ice and heat along with naproxen and hydrocodone with acetaminophen. On 05-APR-2010, she was again seen in the office. The patient still had arm pain. She complained that she needed to sit with the arm supported. She stated that the pain was sharp with motion and radiated to the elbow and upper back. It caused her to miss a few days of work. The physician gave her prednisone and oxycodone with acetaminophen. At the time of this report, the patient was not recovered. The patient sought unspecified medical attention. The reporter considered the adverse events to be disabling and other important medical events. Additional information has been requested.

MedDRA PT No reaction on previous exposure to drug, Pruritus, Pyrexia, Rash generalised

Symptom Text: Information has been received from a registered nurse concerning a 22 year old female with papanicolaou smear abnormal and papilloma viral infection positive (possibly for 16 and 18) and drug reactions or allergies reported as none who on 27-JAN-2010 was vaccinated with a first dose of GARDASIL (lot # 662299/1099Y) intramuscularly. There was no concomitant medication. It was reported that after first dose of vaccine she had no adverse effects. On 29-MAR-2010 she received second dose of GARDASIL (lot # not reported). On the same night as the second dose of vaccine on 29-MAR-2010, she developed a fever, itching and a generalized rash on the abdomen, arms and neck. The rash spread, so she reported to the office on 06-APR-2010. There was no fever when she reported to the office. The physician gave her a prescription for BENADRYL 50mg three times daily for 5 days. At the time of the report on 08-APR-2010 she was recovering. There were no laboratories diagnostics studies performed. Fever, itching and generalized rash on the abdomen, arms and neck were considered to be an other important medical event by the primary reporter. Additional information has been requested.

MedDRA PT Condition aggravated, Epilepsy

Symptom Text: Information has been received from a physician concerning a 16 year old female patient with epilepsy who on unspecified dates was vaccinated with two doses of GARDASIL, 0.5 ml, IM. Concomitant therapy included hormonal contraceptives (unspecified), started "about the same time as the first dose of GARDASIL". The dosage of the birth control pill was increased due to the patient also taking LAMICTAL. The physician reported that the patient had experienced an increase in frequency of seizures since her first dose of GARDASIL. The physician reported that the patient was under the care of an unspecified neurologist due to her known history of epilepsy. At the time of the report the patient's outcome was not specified. The patient sought medical attention by an office visit. No diagnostic tests were performed. Upon internal review increase in frequency of seizures was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Abdominal pain, Cough, Henoch-Schonlein purpura, Myalgia, Petechiae, Pyrexia, Urticaria

Symptom Text: Case reported by Health Authority (case n. 114647) through SPMSD (local case n. IT164/10). An 11 year old female was vaccinated IM on 03-FEB-2010 with one dose of GARDASIL (batch n. NK19200, lot# NJ29430). The patient was allergic to house dust mite. On 20-FEB-2010 she presented with moderate fever (38C) and cough (not considered as an adverse event) concomitantly treated with CLENIL for one day on 21-FEB-2010 and PARACODINA for two days on 22-FEB-2010 and 23-FEB-2010. On 26-FEB-2010 onset of petechiae to the lower limbs, the medical guard diagnosed urticaria (not confirmed by the pediatrician). On 01-MAR-2010 the patient was evaluated by her pediatrician who diagnosed Henoch-Schonlein vasculitis. On 06-MAR-2010 she was admitted to the hospital due to onset of muscle and abdominal pain. She was discharged on 07-MAR-2010 with the recommendation of performing frequent urine analysis for proteinuria/hematuria. The diagnosis of Henoch-Schonlein vasculitis was confirmed by the hospital. At the time of reporting the patient had not yet recovered. The final outcome was not reported. HA coded "vasculitis Henoch Schonlein Like". The case is closed. Other business partner numbers included: E2010-02225.

MedDRA PT Abdominal pain, Hiccups, Nausea

Symptom Text: Information has been received via agency as part of a business agreement, from a physician concerning a 13 year old female patient who on 17-JUL-2009 at 12:30 pm was vaccinated with the first dose of GARDASIL intramuscularly into her left deltoid. This report was part of a post-marketing surveillance program. It was reported that on 17-JUL-2009 at 04:00 pm, she presented to the Health Center with abdominal pain, nausea and hiccups. She was admitted to Health Center and provided dicyclomine and ZOFER injections and kept in the Health Center for observation. On 17-JUL-2009, at 05:45 pm, she was referred to the Hospital for further observation as the Health Center did not have the facility to provide such services after 06:00 pm. She was admitted to the hospital, Casualty on 17-JUL-2009 at 06:50 pm. On admission, she was conscious, coherent. Her body temperature was normal, pulse was 80/mts, blood pressure was 120/80 mm/Hg. On examination her abdomen was soft, no obvious mass or tenderness. Blood test for Hb, ESR, ultrasound of the abdomen and CT scan of the head was done. All tests were reported as normal. She had no further complains and her parent took her home early morning of 18-JUL-2009, prior her being seen by medical staff and getting discharged and was found to be normal after follow up. On 19-JUL-2009, project investigator visited her, and she was well and had no complains. No further information is available.

Other Meds: Unknown

Lab Data: blood pressure measurement, 120/80 mm/Hg; diagnostic laboratory test, Hb test; normal; computed axial tomography, of the head; normal; ultrasound, abdomen;normal; body temp, normal; total heartbeat count, 80 /mts; erythrocyte sedimentation

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Neuropathy peripheral, Pain in extremity

Symptom Text: Information was obtained on request by the company from the agency via a Case Line Listing through CSL as part of a business agreement, concerning a 17 year old female patient who on 27-JAN-2010 was vaccinated with the first dose of GARDASIL 0.5 ml, intramuscularly (lot #NJ39100, batch #NK55510). Concomitant therapy included MICROGYNON. On 21-FEB-2010 the patient experienced leg pain severe and neuropathy severe. The patient's leg pain (severe) and neuropathy (severe) had definite improvement but had not yet recovered. The agency considered that leg pain severe and neuropathy severe were unlikely related to therapy with GARDASIL. The original reporting source was not provided. Additional Information is not expected.

Other Meds: MICROGYNON
