Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Drug exposure during pregnancy, Gastroschisis

Symptom Text: Information has been received from a consumer's OB-GYN, for GARDASIL (Lot # 653937/0637F), a Pregnancy Registry product, concerning a baby boy. The boy's 15 years old mother with no known drug allergies, and with depression who on 31-AUG-2006 at 3:00 PM was vaccinated intramuscularly in the right deltoid with the first dose of with GARDASIL (Lot # 653937/0637F). Illnesses at time of vaccination included flu symptoms and a breast lump. Concomitant therapy included ZOLOFT. Other vaccinations given on 06-SEP-2006 included DTAP (unspecified). It was reported that the patient was aware that she was pregnant but did not disclose this information to her health care provider until after vaccination. Subsequently the patient delivered via vaginal delivery a "healthy baby boy but had gastroschisis". The baby was born on 07-APR-2007 and APGAR scores were 8 and 9 at one and five minutes, respectively. The nurse was unable to provide the infant's birth weight and indicated that infants born with this congenital anomaly are generally hospitalized for 12 weeks. The nurse could not confirm when and if this infant had been discharged from the hospital. The mother's experience has been captured in WAES #0609USA02871. The baby's experiences were previously reported in WAES #0609USA02871 on 22-AUG-2007. Additional information is not expected. The mother's experience has been captured in WAES #0609USA02871. The baby's experiences were previously reported in WAES #0609USA02871 on 22-AUG-2007.

Other Meds: Zoloft

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Encephalitis, Facial palsy, Hypoaesthesia, Hypoaesthesia facial, Hypoaesthesia oral

Symptom Text: This serious case was extracted from VAERS on 28 March 2009 (VAERS reference number 295242). A 13-year-old female patient with no reported medical history had received a first dose intramuscular injection of MENACTRA (lot number and site of administration not reported) and a second dose intramuscular injection of GARDASIL (HPV, manufacturer Merck, lot number and site of administration not reported) on 17 October 2007. On the day of vaccination (also reported as 28 October 2007), the patient complained of numbness to her hands and feet. She later developed numbness in her lower arms, lips and face. She was seen by a neurologist on 12 November 2007 and had been diagnosed with post infection "cerebellitis" and right Bell's Palsy and she was noted to be improving. Laboratory testing included CBC, Chem 16 and ESR; results were reported as lymph %51, alk phos 180 and ESR 2. According to the reporter, the current clinical events were not related to vaccination with GARDASIL. The onset date of 28 October 2007 was reported for the events of numbness to lower arms, lips and face; right Bell's Palsy, and post infection cerebellitis. The patient's recovery status was not reported.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Acute disseminated encephalomyelitis, Ataxia, Azotaemia, Clonus, Diplopia, Dysphagia, Eye movement disorder, Fall, Fatigue, Gait disturbance, IIIrd nerve paralysis, Intensive care, Muscular weakness, Pain, Renal disorder, Renal impairment, Strabismus

Symptom Text: This case was extracted from the VAERS database on 28 March 2009 (reference number 295507). A 12-year-old female patient received an intramuscular first dose of MENACTRA (lot not reported) and an intramuscular first dose of GARDASIL (Merck, lot not reported) on 24 July 2007. On approximately 07 August 2007, 14 days post-vaccination, the patient began developing diplopia, ataxia, and weakness in the extremities. She was seen by a physician on 13 August 2007 and noted to have an unsteady gait and abnormal eye movements. She had reportedly began "running into things and falling", with worsening weakness and pain. Physical exam was remarkable for decreased strength in the upper and lower extremities, 1-beat clonus bilaterally, cranial nerve III palsy, and right exotropia. MRI of the brain was markedly abnormal involving midbrain and base of brain. BUN and creatinine were increased. She was admitted to the PICU on 14 August 2007 after becoming increasingly more encephalopathic during admission. She developed deteriorating renal function/azotemia, which worsened following a CT with contrast. Treatment included intravenous and oral steroids, and she was discharged on hospital day 10 with aspiration precautions. Treatment included intravenous and oral steroids, and she was discharged on hospital day 10 with aspiration precautions. No formal discharge diagnosis was noted, but a diagnosis of acute disseminated encephalomyelitis was proposed following diagnostic studies. As of a follow-up phone call on 28 December 2007, the patient still had occasional double vision when tired. Other symptoms, including ataxia, dysphagia, and renal dysfunction, had resolved. Final outcome was not reported. Follow up information was received on 10 April 2009 from the Food and Drug Administration (FDA). Per the FDA, this case did not meet probable or confirmed ADEM case definition of diagnostic certainty for level 1 or 2. Documents held by sender: None.

Other Meds:

Lab Data: MRI of the brain was markedly abnormal involving midbrain and base of brain. BUN and creatinine were increased.

History: None reported.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abasia, Arthralgia, Gastrointestinal disorder, Loss of consciousness, Migraine, Monoplegia, Myalgia, Neuropathy peripheral, Rash, Skin papilloma, Sleep apnoea syndrome, Syncope, Visual field defect

Symptom Text: A consumer obtained the information from a news article that her daughter who in November 2007, was vaccinated with a dose of GARDASIL (lot number not provided). The patient was vaccinated the next two doses of GARDASIL on unspecified dates. The patient was constantly fainting. When she fainted, she lost her ability to walk. On approximately 15-SEP-2009, "just two days ago", the patient was found unconscious in the hall at school and was brought back by a paramedic. The patient was diagnosed with peripheral neuropathy in both feet, migraine headaches, fainting (syncope) and sleep apnea. The patient has lost peripheral vision in her left eye and reported that her joints and muscles hurt constantly. The patient also had gotten warts, rashes and digestive illnesses. The patient has not had a period since November of 2007. The patient's arm became paralyzed after her third shot. It was unknown if the patient sought medical attention. At the time of the report, the outcome of the event was unknown. Upon internal review, sleep apnea and lost peripheral vision in her left eye were determined to be other important medical events. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Caesarean section, Delivery, Drug exposure during pregnancy, Metrorrhagia, Muscle spasms, Pre-eclampsia

Symptom Text: Information has been received from a nurse concerning a 13 year old female who on 01-FEB-2008 was vaccinated with the first dose of Gardasil and is now pregnant. Concomitant therapy included MIRALAX. The patient is currently spotting and cramping which is relieved by rest. Medical attention was sought at the school nurse. Patient outcome is unknown. No product quality complaint was involved. Additional information has been requested. This is in follow-up to report (s) previously submitted on 3/14/2008. Additional information has been received from the physician who stated that the patient "had no complications from the vaccine" and she and the baby were fine. The physician reported that the patient was diagnosed with pre-eclampsia and delivered at about 30-32 weeks gestation by cesarean section. The physician also added the mother and the baby were both doing fine now. The mother was physically fine. The reporter also added that the baby had no anomalies "nothing untoward because of the vaccine". Upon internal review, pre-eclampsia and delivered at about 30-32 weeks gestation by cesarean section were considered to be Other Important Medical Events. Additional information is not expected.

MedDRA PT Blunted affect, Condition aggravated, Conversion disorder, Decreased eye contact, Dysphemia, Encephalopathy, Headache, Hypoaesthesia, Induration, Muscle twitching, Sensory loss, Speech disorder, Stress, Tremor, Vertigo

Symptom Text: A 13-year-old female patient received MENACTRA and GARDASIL (Merck); lot numbers not reported) on 20 August 2007. On an unreported date, she developed left-sided numbness, left hand, face, and leg tremors, twitching, periodic vertigo, headache, and her left arm was "hard". Upon examination she was noted to have blunted affect, poor eye contact, slow speech, and mild decreased sensation of the left upper extremity with normal strength, tone, and reflexes. She was seen in a neurology clinic from 20 January through 21 February 2008, and during that time her tremors increased and she had begun stuttering. An EEG was abnormal, with mild encephalopathy and abnormalities suggesting a risk for focal seizures. CBC, chemistry, UA, urine culture and sensitivity, monospot, and MRI of the brain and spine were all within normal limits. The final diagnosis was stress-induced conversion reaction. The patient was referred for counseling; outcome was not reported.

Other Meds:

Lab Data: An EEG was abnormal, with mild encephalopathy and abnormalities suggesting a risk for focal seizures. CBC, chemistry, UA, urine culture and sensitivity, monospot, and MRI of the brain and spine were all within normal limits.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Drug exposure during pregnancy, Pyrexia

Symptom Text: Information has been received from an office manager for the pregnancy registry for GARDASIL concerning a 20 year old female with no medical history and no known allergies who on 28-FEB-2008 was vaccinated with the second dose of GARDASIL (Lot # 655327/1287U). There was no concomitant medication. The reporter indicated that the patient was pregnant with an expected due date of 02-DEC-2008. Unknown medical attention was sought in the office. Patient outcome was unknown. No product quality complaint was involved. Follow up information received from a nurse revealed that the patient had a spontaneous vaginal birth on 25-NOV-2008 and delivered a healthy, normal, female weighing 7 pounds and 4 ounces. There were no prenatal complications. The only additional note was that of "maternal fever" in labor, with no further explanatory information. The patient was seen for her post partum visit and was fine. No further information is available.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Back pain, Dizziness, Migraine

Symptom Text: Information has been reported in non medical media article that a 15 year old consumer and her mother reported that on an unknown date the patient was vaccinated with a first and second dose of GARDASIL. It was reported in the news media that after two doses, the vaccine knocked the patient "on her back for two months". It was also reported that the patient stated that though better now "I still have a lot of terrible migraine headaches and back pain, dizziness". The patient's mother also stated that: "That hits close to home in the sense of when your daughter's laying in a hospital's bed". It was not specified if the patient was hospitalized. Upon internal review "on her back for two months" was considered as disabling. No further information is available.

MedDRA PT Abdominal pain, Abdominal pain upper, Asthenia, Chest pain, Computerised tomogram, Delusion, Disorientation, Dizziness, Hot flush, Hyperhidrosis, Loss of consciousness, Malaise, Myalgia, Nausea, Syncope, Ultrasound scan, Visual impairment, X-ray

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act concerning a 15-year-old female with no known allergy nor illness, who on 02-MAY-2007 was vaccinated IM in her left arm with the second dose of GARDASIL vaccine (lot # 658094/0524U). Concomitant medication included albuterol. On 24-JUN-2007, the patient experienced lightheadedness, dizzy, seeing spots, abdominal pain, nausea and left upper quad pain. It was not reported whether medical attention was sought. In July of 2007 after the vaccination, she experienced all of these (lightheadedness, dizzy, seeing spots, abdominal pain, nausea and left upper quad pain) plus severe hot flushes, sweats, severe muscle pain and weakness, collapsing and passing out as well as chest pain. According to the report: "she was now sick on a monthly basis and her sickness usually last 7-8 days. She also becomes delusional at times and spacey." The report also stated: "Several different lab studies, ultra sounds, x-rays, CT scans and an appointment with the endocrinologist which didn't do us any good. She was a perfectly healthy kid until she received this vaccine." The original reporting source was not provided. The VAERS ID # is 318483. No further information is available. A standard lot check investigation was performed. All in-process quality checks for the lot number in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to released met all release specifications. The lot met the requirements of the research center and was released.

MedDRA PT Angiogram, Computerised tomogram, Condition aggravated, Conversion disorder, Deafness, Echocardiogram, Electroencephalogram, Epistaxis, Gait disturbance, Lumbar puncture, Migraine, Muscular weakness, Myalgia, Nuclear magnetic resonance imaging, Nuclear magnetic resonance imaging brain, Palpitations, Regressive behaviour, Syncope, Vaginal odour

Symptom Text: Information has been received from a physician concerning a 21 year old female with partial hearing loss due to congenital sensory nerve damage, irritable bowel syndrome and gastrooesophageal reflux disease and a history of gastric ulcer perforation who was vaccinated IM with the first dose of GARDASIL, 0.5ml on 15-JUN-2007. There was no concomitant medication. Starting on 22-JUN-2007 the patient experienced migraine headaches and palpitations. In October 2007 the patient received her second IM dose of GARDASIL 0.5 ml, but has not had her third dose. In January 2008, the patient started having syncopal episodes and pseudoseizures. The patient, who was born with hearing loss due to sensory nerve damage, lost her remaining hearing in March 2008. Since the beginning of 2009, the patient had experienced episodes of behavioral regression as well as muscle pain and weakness. Due to the muscle weakness, the patient had limited ambulation. Since April 2009 the patient had recurrent nosebleeds. The patient has required multiple hospitalizations and office visits. The patient had MRI/MRA of head, CT Scan/CTA of head, EEG, echocardiogram, lumbar puncture and angiogram performed (results not reported). At the time of the report (on 18-MAY-2009) the patient was not recovered. The reporter considered the events to be disabling. Additional information has been requested. 7/9/09 Medical records received DOS 6/5/07 to 10/5/07. Patient complains of vaginal odor.

Other Meds: None

Lab Data: Unknown. 7/9/09 Medical records received DOS 6/5/07 to 10/5/07. LABS and Diagnostics: All pending. PAP, GC, Vaginitis Panel, Thyroid panel, Glucose, endocrine studies.

History: Gastric ulcer perforation

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abasia, Alopecia, Autism spectrum disorder, Blood testosterone increased, Chest pain, Convulsion, Deafness, Emotional disorder, Epistaxis, Flushing, Foaming at mouth, Gastrooesophageal reflux disease, Hallucination, Irritable bowel syndrome, Malaise, Migraine, Nausea, Oedema peripheral, Pain, Paraesthesia, Regressive behaviour, Syncope, Tonic clonic movements, Tremor, Weight increased, Wheelchair user

Symptom Text: Information has been received from a consumer concerning her 21 year old daughter with "immune deficiency runs in family" who on 15-JUN-2007 and on 15-OCT-2007 was vaccinated with first dose (route not reported, lot number 0469U) and second dose (route not reported, lot number 654539/0742U) respectively of GARDASIL. The patient's mother reported that her daughter has been severely ill since receiving the second dose of the vaccine. It was reported that on 17-OCT-2007, the patient's symptoms started with chest pain, migraines, fainting, facial flushing, seizure and nausea. It was reported that she now has emotional regression and spectrum disorder, swelling of legs and feet, inability to walk, pain all over her body, felt "shocks to her brain", clonic tonic symptoms, hair loss, foaming from mouth, nosebleeds, hallucinations, hearing loss, weight gain, shaking like PARKINSON's disease, acid reflux, irritable bowel and high testosterone levels. She reported that her daughter was gone to the hospital over fifteen times and had been admitted nine times to three different hospitals. The patient has been seen by many doctors including neurologist and neuropsychiatrist. She had also had alternative medicine treatments including detoxification, cranial massage and reflexology. It was reported that she was now using a wheelchair and needed to be carried. Lab tests performed included lumbar puncture, cerebral angiogram, EEG and many others which were all negative. As of 19-JUN-2009, the patient had not recovered from the events. Additional information has been requested. 02/01/2010 Seizures, syncope, numbness, tingling, profound deafness, hair loss, bloddy nose, chronic pain, fatigue, shortness of breath, regression occassional inability to walk, legs give out, brain fog, confusion.

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Blood product transfusion, Depressed level of consciousness, Electroencephalogram, Fatigue, Gait disturbance, Guillain-Barre syndrome, Headache, Lumbar puncture, Myalgia, Nausea, Nuclear magnetic resonance imaging, Ultrasound scan

Symptom Text: Information has been received from a Registered Nurse (R.N.) concerning a 19 year old female who on 17-JUN-2008 was vaccinated with the first 0.5 ml dose of GARDASIL (lot number not provided). Concomitant therapy included MENACTRA. On 11-AUG-2008 the patient experienced fatigue and walking problem. The patient was hospitalized from 21-AUG-2008 to 24-AUG-2008 and on 24-AUG-2008 the patient was diagnosed with Guillain Barre syndrome. At the time of reporting the patient was not recovered. Follow up information was received from a Registered Nurse (R.N.) on 06-MAY-2009 via telephone provided the patient's name and date of birth. She confirmed that the patient received the first and only dose of GARDASIL on 17-JUN-2008 (lot# 660391/0063X) along with concomitant vaccine MENACTRA. The AE onset date was 11-AUG-2008 around 1:00 am. She went to the emergency room via ambulance with intolerable head and muscle pain, difficulty walking, nausea, and change of responsiveness. At the emergency room she was told that it was "viral" and was sent home. On 21-AUG-2008 she had a follow up doctor visit and she went into another hospital, while there she was referred to a neurologist. A CAT scan (negative results), EEG, Spinal Tap, MRI, and ultrasound of her bladder were performed. She was diagnosed with Guillain Barre syndrome. She was hospitalized from 21-AUG-2008 to 24-AUG-2008. She received globulin intravenously, pain medication, and physical therapy. Prior to this the patient had a baby. It was reported that as of 17-MAR-2009 the patient was still recovering and still going to physical therapy. Additional information has been requested.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician for VARIVAX, a pregnancy registry product, concerning a 15 year old female patient who on 15-JUL-2008 was vaccinated with a dose of VARIVAX (lot #659844/0085X) when she was pregnant. That same day, she was vaccinated with hepatitis A virus vaccine (unspecified) and MENACTRA. On 26-AUG-2008, the patient had a urine pregnancy test done confirming the pregnancy. No adverse event was reported. The patient sought medical attention informing staff she missed her period after she was vaccinated. Follow up information received on 20-MAY-2009 from the physician stated that the patient received a dose of VARIVAX, GARDASIL, and MENACTRA at the same medical center. Two weeks after the pregnancy was confirmed the patient had an elective termination of pregnancy. At the time of reporting the patient's outcome was unknown. Upon internal review elective termination was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Inappropriate schedule of drug administration, Ovarian cyst

Symptom Text: Initial and follow-up information has been received from a licensed practical nurse for the pregnancy registry GARADASIL concerning a 14 year old white female with asthma and no allergies, no previous pregnancies and a history of appendicectomy who on 23-MAY-2007 was vaccinated with the first dose of GARDASIL, IM 0.5 mL (lot # 654535/0960F). On 02-JAN-2008 the patient was vaccinated with the second dose of GARDASIL, IM 0.5 mL (lot # 659055/1522U). On 09-APR-2008, the patient was noted to have a right ovarian cyst. On 07-MAY-2008 the patient vaccinated with the third dose of GARDASIL, IM 0.5 mL (lot # 659964/1978U). Concomitant therapy included FLOVENT and albuterol. The patient's last menstrual period was 17-MAY-2008. The estimated due date is 21-FEB-2009. The patient had a positive urine pregnancy test on 14-AUG-2008. The ultrasound was performed on 26-AUG-2008 for dates with the results of 11 week 2 day fetus. No problems reported. The patient sought medical attention in the office visit. Additional information has been requested. This is in follow-up to report (s) previously submitted on 10/14/2008; 7/8/2009. Follow-up information was received from the LPN via a pregnancy questionnaire. Other medication used during pregnancy included TYLENOL for headache as needed. On 17-MAR-2009 the patient delivered a normal male baby weighing 7 pounds 14 ounces with apgar score 8/9 at 40 weeks and 2 days. The length of the baby was 20.25 inches and head circumference was 33.5 cm. There were no congenital anomalies or other complications or abnormalities. There was no complication during pregnancy and labor/delivery. There was no diagnostic test during pregnancy. Follow-up information was received from a physician via pediatric medical records. The baby with no known drug allergies was treated with erythromycin (05-APR-2009) (reason not reported). On 23-MAR-2009, the baby was seen by the physician with the assessment of a well physical examination. On 30-MAR-2009 the baby was seen with results of weight normal an

MedDRA PT B-cell lymphoma, Chemotherapy, Lymphadenopathy, Mediastinal mass, Neck mass, Non-Hodgkins lymphoma

Symptom Text: I received my first dose of Gardasil in July 2008 and my second dose in September 2008. I was diagnosed with a primary mediastinal B cell lymphoma (non-Hodgkin's) after feeling an enlarged supraclavicular lymph node in November 2008. CT/PET scan results showed a mass in my mediastinum as well as in my neck. I received 5 cyles of chemotherapy with cyclophosphamide, doxorubicin, vincristine, prednisone, methotrexate, and rituxan, as well as prophylactic intraspinal chemotherapy. I was declared cancer-free in February 2009 and am currently in remission.

MedDRA PT Cancer in remission, Chemotherapy, Chest X-ray, Computerised tomogram, Fatigue, Lymphadenopathy, Migraine, Non-Hodgkins lymphoma, Pain, Positron emission tomogram, Pruritus generalised

Symptom Text: Information has been received from a consumer concerning a her 19 year old daughter with pertinent medical history reported as none and drug reactions or allergies reported as none who in January or February 2007, was vaccinated with a first dose of GARDASIL (lot # not reported). In April 2007 she received second dose of GARDASIL (lot # not reported). In August 2007 she received third dose of GARDASIL (lot # not reported). In November 2007 after vaccination with GARDASIL the patient developed non-Hodgkin's lymphoma. The first symptoms were itching all over her body, swollen lymph nodes and fatigue. She had 3A nodular sclerosing lymphoma. She had undergone 6 cycles of chemotherapy in 2008. At the time on the report on 07-AUG-2009 she was currently in remission. Upon internal review non-Hodgkin's lymphoma was determined to be an other important medical event. Follow up information has been received via telephone call from a nurse who refused to give any information concerning the patient without written authorization from the patient. Also the nurse stated that the patient received GARDASIL vaccinations at another physician's office. All telephone attempts to obtain follow up information have been unsuccessful. Additional information has been requested. 02/01/2010 Follow-up: Currently in remission. Requires regular CT, PET and chest x-rays for the next for years. She has recently had sever migraines and this pain.

MedDRA PT Abdominal pain upper, Autopsy, Death, Migraine

Symptom Text: Information has been received from a consumer, via a transcript of TV program concerning her 20 year old daughter who in September 2008 was vaccinated with GARDASIL (lot# not reported). The mother stated that almost immediately after receiving the vaccine, the patient suffered "unusual symptoms". In November 2008, two months later, the patient died without any apparent reason. The mother reported the autopsy revealed an "undetermined cause of death". The mother stated that her daughter was complaining of having migraine headaches and she had severe stomach pains the night before she passed away. The mother suspected her daughter's death as a result of GARDASIL. No further information is available at this time.

MedDRA PT Autopsy, Cardiomegaly, Death, Ventricular arrhythmia

Symptom Text: Information has been received from a consumer through an article on the internet concerning an 18 year old female who on an unspecified date was vaccinated with the dose of GARDASIL. On an unspecified date the patient died. The autopsy was performed and it was revealed that there was biventricular cardiomegaly, transmural replacement of myocytes by fibro-fatty tissue in the right ventricular wall and also diffuse variable myocyte hypertrophy. The arrhythmogenic right ventricular dysplasia (ARVD) was reported as a possible diagnosis. It was stated that because of the extensive tissue degeneration that had occurred prior to autopsy, some of these diagnostic findings could not be definitely identified. The cause of death was unspecified. This is one of several cases from the same source. Additional information has been requested.

MedDRA PT Injected limb mobility decreased, Injection site pain, No reaction on previous exposure to drug, Pain, Pain in extremity

Symptom Text: Information has been received from a physician concerning a 13-year-old female with no medical history or allergies who on 14-OCT-2008 was vaccinated with the first dose of GARDASIL (Lot# 661044/0548X) 0.5ml. There were no concomitant medications. Patient didn't experience an AE after first dose. On 16-DEC-2008 the patient received the second dose of GARDASIL (Lot# 661764/0650X) 0.5ml. Subsequently, the patient developed pain at the injection site. The patient was recovered in January 2009. Additional information provided from a nurse indicated that the patient received her first dose of GARDASIL (Lot# 661044/0548X) 0.5ml on 14-OCT-2008. Following that injection she experienced "soreness to the touch" for 2 months (injection site reaction). The patient received her second dose of GARDASIL (Lot# 661764/0650X) 0.5ml on 17-DEC-2008. Right after the injection the patient experienced "shooting pains from the injection site to her fingertips". This had continued for several months. The patient was currently stating that the "shooting pain" has resolved, but she is not able to keep her arm raised because it bothers her. "It feels weird." The example the nurse provided is "she can not keep her arm raised while she is in school." The patient had sought unspecified medical attention. Additional information has been requested.

Seriousness: ER VISIT, LIFE THREATENING, SERIOUS

MedDRA PT Alopecia, Chest X-ray, Contusion, Diarrhoea, Dyspnoea, Ear infection, Influenza like illness, Nasopharyngitis, Pneumonia, Pyrexia, Sinusitis, Vomiting

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 17 year old female with an allergy to amoxicillin and AUGMENTIN who on 23-JAN-2007 was vaccinated intramuscularly with a first dose of GARDASIL (lot # 654389/0961F). Suspect therapy given intramuscularly included a first dose of VAQTA (lot #656495/1209F). Other concomitant therapy included a first dose of MENACTRA (lot # U2107AA) vaccinated intramuscularly on 23-JAN-2007. On 16-JUL-2007 the patient developed severe case of pneumonia with fever, no cough or cold prior. The patient was sent to hospital for chest X-ray where she was given inhalation therapy and prescribed cefdinir (300 mg) and albuterol (90 mg). In the evening of 16-JUL-2007, the patient went to emergency room when she couldn't breath. The patient received inhalation therapy and Z-PAK. On 18-JUL-2007 the patient was checked at doctor's office for improvement. On 19-JUL-2007 the patient was given additional albuterol (0.83 mg) and told to use one vial every 4 hours. It was reported that in July 2007, the patient was given refill of Z-PAK. On approximately 07-SEP-2007 the patient experienced fever. On 28-SEP-2007 the patient experienced sinus infection and was prescribed Z-PAK. It was also reported that in September 2007, the patient began losing substantial amounts of hair that continued for approximately 4 months. On 07-MAR-2008 the patient was seen for ear and sinus infection and fever and was prescribed Z-PAK. On 19-DEC-2008 the patient developed flu-like symptoms with vomiting, diarrhea and fever. The patient was given PHENERGAN (25 mg) and was sent to hospital when vomiting continued. The patient was given 3 bags of IV fluid and treated for vomiting and diarrhea. On 20-JAN-2009 the patient developed cold symptoms and fever. It was also reported that the patient had chronic bruising. Alopecia, contusion, diarrhoea, ear infection, influenza like illness, nasopharyngitis, pneumonia, pyrexia, respiratory arrest, sinu

MedDRA PT Autoimmune thyroiditis, Convulsion, Electroencephalogram, Encephalitis, Endotracheal intubation, Laboratory test, Lumbar puncture, Respiratory arrest, Weight increased

Symptom Text: Information has been received from a nurse concerning a 17 year old female with no medical history or drug allergies, who over a year ago was vaccinated with a 0.5 mL second dose of GARDASIL. Two months later the patient started experiencing "major seizures". With her first seizure she went to the emergency room and later she was diagnosed with Hashimoto's encephalitis. The nurse mentioned that the patient was hospitalized and intubated twice because the seizures would cause her to go into respiratory arrest. She was placed on steroids as well as other medications (manufacturers unspecified) and steroids caused her to gain weight. The patient had a series of spinal taps, electroencephalographies, and other unspecified laboratory tests done. Therapy with GARDASIL was discontinued. At the time of this report the patient had not recovered. Hashimoto's encephalitis, gain weight and respiratory arrest were considered to be immediately life-threatening. Additional information has been requested.

MedDRA PT Areflexia, Asthenia, Ataxia, Blood product transfusion, Dizziness, Guillain-Barre syndrome, Headache, Vertigo, Vomiting

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. On 15-JAN-2009, a 10 year old female with allergy to AMPICILLIN SULBACTAM was vaccinated IM into the right arm with the first dose of GARDASIL (lot # 0719X). There was no concomitant therapy. There was no preexisting illness. Thirteen days later on 28-JAN-2009 and for 3 days the patient had vomit, dizziness and cephalgia, later vertiginous sensation. On 31-JAN-2009, the patient presented a frank ataxia gait and progressive loss of strength in lower and upper extremities almost totally in the following 3 days with loss of osteotendinous reflexes. They had taken a normal brain computed axial tomography (CT) scan, a normal magnetic resonance imaging (MRI) and nerve conduction studies compatible with GBS. She started treatment with immunoglobulin with a response in 72 hours and almost total recovery of the motor function. Vertiginous felling and cephalgia still persisted. The listing indicated that one or more of the events required hospitalization, was considered to be immediately life-threatening. No further information is available. The original reporting source was not provided. The VAERS ID # is 339375. A standard lot check investigation has been finalized. All in-process quality checks for the lot number in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the Center and was released.

MedDRA PT Arrested labour, Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse and a doctor for the Pregnancy Registry for GARDASIL regarding a 15 year old female with of depression and stress gastritis (no medication prescribed) who on 22-APR-2008 was vaccinated intramuscularly with her first dose of GARDASIL (Lot # and site not reported). Concomitant therapy included VAQTA (Lot, site and route not reported). Other concomitant therapy included MENACTRA and Tdap (unspecified). Later on the evening of 22-APR-2008 the patient had a urine pregnancy test which was positive (not further specified). On 24-APR-2008, the patient returned to the office and a urine pregnancy test was performed which was positive (LMP "late February 2008"). No adverse effects were reported. The patient outcome was not reported. No additional information was provided. Follow-up information was received from a charge nurse who reported the patient delivered a male baby on 16-NOV-2008, at 38+1 weeks gestation. The patient was in labor, but experienced an "arrest of descent" in second stage, with a failed attempt at a vacuum delivery, and ultimately had a cesarean delivery. The baby weighed 6LBS 15oz. The baby was healthy and didn't have any problems. Upon internal review, arrest of descent was determined to be an other important medical events. No additional information was expected.

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain upper, Arthralgia, Chills, Convulsion, Dyskinesia, Dyspnoea, Gaze palsy, Headache, Joint lock, Muscle spasms, Muscle twitching, Musculoskeletal pain, Nervous system disorder, Opisthotonus, Ovarian cyst, Paraesthesia, Screaming, Speech disorder, Throat tightness, Tremor

Symptom Text: Reported once to Vaers, after first hospitalization. #E-28199 02/16/2009. My daughter continues having the violent seizure like episodes. Severe muscle spasms in her low back, making her fold backward, screaming in pain. Was hospitalized again on 4/02 through 4/05, again on 4/12 through 4/14. Her seizure episodes continued to get worse, even at times making her struggle for air. Felt like her throat was closing. Still having headaches. We then went to Mayo Clinic in MN, they slowly removed her from her medicines, she continued to have the episodes, but frequency was slowing down. Her eyes would also roll back into her head, and her speaking became "jibberish" while she was having the episodes. She also started complaining of stabbing pains in her lower stomach. That turned out to be an Ovarian Cyst. She was in the ER 3 times, after initial vaers report, 2 via ambulance. 6/01/2009, things seem to start getting better, episodes are limited to when she goes to bed, and drifts off to sleep. Her muscles twitch, jerk, and seem to have a mind of their own. She does not have control of her body, her muscles do. Still having headaches. 8/29/2009, things are mellowing out from 2/2009, but she still has neurological problems. Her head and neck twitch together, eyes roll back, electric volts feel like they go through her body, she shivers and it travels through her body, hands fold in, arms & legs shake uncontrollably. Her hips lock up, she cannot move, it hurts her very bad. It lasts from 7-10 minutes. Sometimes her arm just starts moving in all directions, she cannot stop it, today, it twisted itself so bad that her elbow, shoulder and wrist are very sore. It is the strangiest thing I have ever seen. The muscles have a mind of their own~ that is the only way I know how to explain it.

MedDRA PT Abdominal pain, Asthma, Biopsy skin, Computerised tomogram, Hyperhidrosis, Lethargy, Myalgia, Ovarian cyst ruptured, Pyrexia, Scar, Skin disorder, Skin lesion, Vertigo

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 13 year old very healthy and athletic female patient, allergic to the fruit formula given before having a CAT scan, was vaccinated in the left arm with the first dose of GARDASIL (Lot # 659435/1265U). Concomitantly, the first dose of influenza virus vaccine (unspecified) (manufacturer unknown) (Lot # 500487P) was given. It was reported that the patient experienced fever, severe abdominal pain and muscle aches. The patient was lethargic and had asthma. The patient also developed skin indentations (tissue break down up underneath the skin). The indentations were circular in size, starting around the injection site and had spread throughout entire body. A specialist stated that had never seen anything like it. The patient was referred for further testing. The indentations were not going away but permanently scarring the patient. The patient was also experiencing vertigo. Records received on 23-MAR-2009 from date of Service of 10-NOV-2008 presented a patient complaining of lesions to trunk and extremities. Records received on 30-MAR-2009 from Emergency Department visit on 02-NOV-2008 showed a patient complaining of abdominal pain and a diagnosis of ruptured ovarian cyst. Doctor's office records showed two other shots of Td adult vaccine given on 17-OCT-2008 (Lot # C2778AP) and also MONOTZ (Lot # U2426AA) given on 18-OCT-2007. Several biopsies were performed by two dermatologist (specialist) and regular dermatologist with unreported results. The patient did several regular doctor visits. An ultrasound and CAT scan of abdomen-biopsy were performed, which records were received on 23-MAR-2009, with unreported results. The listing indicated that one or more of the events required hospitalization. No further information is available. The original reporting source was not provided. The VAERS ID # 342045. Follow up information was received on 01-MAY-2009 via a senator's office, from a constit

Symptom Text: Initial information has been received from a consumer concerning her 13 year old daughter who in May 2007 was vaccinated with the first dose of GARDASIL (lot # 655618/0186U) along with HAVRIX. Then about four months after the first dose in approximately September 2007 she experienced abdominal pain and soreness in the arm. Then On 24-JUN-2008, the patient was vaccinated with the second dose of GARDASIL (lot # 660555/0279X) along with HAVRIX and about four months after receiving the second dose in approximately October 2008 the patient collapsed on the basketball court with abdominal pain and chest pain which kept on getting worse. Then she received her third dose of GARDASIL (lot # 661044/0548X) along with MENGITIS (manufacturer unspecified) and HAVRIX and was experiencing abdominal pain, low blood pressure, high heart rate, legs feet and stomach felt like they were burning, but were cold to the touch and she had seizure like symptoms, fatigue and throwing up bile. The consumer reported that the patient has been in hospital from October, 2008 till March, 2009, went to the emergency room 8 times and was in the hospital for 25 days. The consumer also reported that after receiving the third dose of GARDASIL the patient had her gall bladder removed and was hospitalized for four days. Consumer reported that the patient has had many test done, which came back negative, and she was still experiencing abdominal pains. No further AE information provided. The consumer had completed the online document on the MERCK VAERS website. She provided reference # E28764. Follow up information has been received from a physician concerning the 13 year old female patient with a history of attention deficit disorder who on 24-MAY-2007 was vaccinated with the first dose of GARDASIL (lot # 655618/0186U) and concomitantly received the first dose of HAVRIX (lot # 0001U) (previously reported as Hep A). On 24-JUN-2008, the patient was vaccinated with the second dose of GARDASIL (lot # 660555/0279X) and concomitantly received the second dose o

MedDRA PT Convulsion, Generalised non-convulsive epilepsy, Headache, Speech disorder, Staring, Tremor, Unresponsive to stimuli

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Act. A 14 year old female with a history of premature birth (36 weeks) on 03-SEP-2008 was vaccinated into the left arm with GARDASIL (lot # 659184/0843X). Concomitant therapy included MENACTRA. Approximately two weeks after the patient got the 1st GARDASIL she started having seizures. The patient had no family history of seizures (also reported as has family history of seizures in paternal aunt) and had always been a healthy person. She was now on medication to help control the seizures (KEPPRA) 500 mg in the morning and 1000 mg at night. On 08-APR-2009 neuroconsults received which was dated from 30-DEC-2008 and 20-JAN-2009. The patient was for evaluation of seizures following multiple episodes of shaking of left arm, staring and unresponsiveness. Episodes first began in late summer 2008 which consisted of just arm shaking lasting less than a minute. In November 2008 the patient complained of headache and the parents noticed the patient with left arm a shaking, dropped the object which the patient was holding, staring and unresponsive. The patient had awareness of event but was unable to speak. And it was resolved after approximately 1 minute. In early December 2008 the patient was found apparently sleeping on bathroom floor and slept two hours after event. The patient was sent for EEG (electroencephalography) which was abnormal and c/w non-convulsive primary generalized epilepsy. Brain MRI (magnetic resonance imaging) was within normal limits. Head CT (computed axial tomography) was within normal limits. Follow up on 20-JAN-2009 with continued episodes. In addition, the patient again found on bath room floor apparently sleeping. So the patient started on KEPPRA although unclear if episodes were seizures. Generalised non-convulsive epilepsy, staring, headache, speech disorder, tremor and unresponsive to stimuli was considered to be immediately life-threatening and other important medical events. A standard lot

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Abdominal pain, Biopsy bone marrow, Biopsy liver abnormal, Diarrhoea, Fatigue, Gallbladder disorder, Hepatic failure, Hepatitis acute, Hepatomegaly, Jaundice, Pharyngitis, Rash erythematous, Rash papular, Rash pruritic, Splenomegaly, Transaminases increased, Vomiting

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 12 year old female on 19-DEC-2008 was vaccinated intramuscularly into right arm with a first dose of GARDASIL (lot # 661531/1311X). Concomitant therapy included ADACEL and HAVRIX. At time and the months up to March the patient was no local or systemic reaction to any of the Immunizations. On 03-March-2009 the patient came to the office with s/sx of fatigue, abdominal pain and jaundice. UA was done and showed 3 plus Bilirubin and 2 plus urobilirubin. She had hepatomegaly and splenomegaly and pharyngitis. Labs revealed Epstein Barr Positive IgG antibody which may indicate a past infection-mono. The patient returned to the clinic with severe jaundice. The patient had negative Hepatitis panel with abnormal Hepatic levels. The patient consulted Pediatric Infectious Disease Specialist, and repeat labs showed increases in liver enzymes and bilirubin level and US showed enlarged grossly thickened gallbladder wall, mild hepatomegaly and mod splenomegaly. There was no evidence of bilary duct obstruction or pancreatic abnormality noted. Hospital was consulted and patient was admitted where her hepatic levels continued to rise as well as her INR. She was at hospital for almost three weeks and a bone marrow was done. She was discharged 05-APR-2009 and her hepatic functions and INR are continuing to be monitored. This form is filled out at the request of physicians in the event the vaccines contributed to the illness. Doctor called this "seronegative hepatitis". On 16-APR-2009, records was received-for DOS from 17-MAR-2009 to 05-APR-2009: DC DX: DC DX: Liver failure, rash. The patient's Transaminases elevated. Needle biopsy showed acute hepatitis without necrosis. Hepatitis differential diagnosis is infectious versus autoimmune. Skin biopsy showed slig. The patient was presented with sudden onset of emesis, abdominal pain, diarrhea and jaundice 3 weeks prior to admission. The patient developed

MedDRA PT Immediate post-injection reaction, Loss of consciousness, Syncope

Symptom Text: Information has been received from a registered nurse concerning a 16 year old female patient who on 16-APR-2009 was vaccinated with the first dose of GARDASIL. There was no concomitant vaccines administered when the patient received GARDASIL. The patient fainted immediately after receiving the vaccination. The patient lost consciousness for a couple of seconds and then regained consciousness. The patient was evaluated within the office in the Extended Care area. The patient was fine and had recovered. The patient was not hospitalized. The R.N. did not feel that the incident was life-threatening or disabling. The R.N. did not think the patient would continue the GARDASIL series. Additional information has been requested.

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 12 year old female with environmental allergies as well as an allergy to penicillin and a history of tonsillectomy was vaccinated intramuscularly with the first dose of GARDASIL (lot# 655503/0012U) on 23-AUG-2007. She was vaccinated with the second dose of VARIVAX (Oka/Merck) (lot# 657752/0780U) on the same date. After receiving vaccine, the patient started having bouts of rectal bleeding and diarrhea. In additional to this she had a very loud barking "chronic" cough. She was finally diagnosed with ulcerative colitis. She had to have a total colectomy resulting with an ostomy and several blood transfusions. On 28-APR-2009 extensive medical record was received for multiple hospital admissions and emergency room visits from MAY 2008-APRIL 2009 with the following discharge diagnoses. Date of service: 03-OCT-2008 to 05-OCT-2008 for inflammatory bowel disease and anemia status post PRBC transfusions. Date of service: 08-OCT-2008 to 31-OCT-2008 for ulcerative colitis, pancreatitis status post laparotomy colectomy with ileostomy, explorative laparotomy with adhesiolysis and wash out. Date of service: 5-JAN-2009 to 08-JAN-2009 ulcerative colitis status post colectomy, acute pancreatitis, pancreas divisum and urinary tract infection. Date of service: 16-FEB-2009 to 22-FEB-2009 for laparotomy cholecystectomy, laparotomy assisted J-pouch ileorectal anastomosis, anorectal pull through, loop ileostomy. Date of service: 03-APR-2009 to 06-APR-2009 for ulcerative colitis, pancreatitis, bowel Obstruction. Multiple emergency room visits with diagnose: on 25-APR-2008 the patient was diagnosed with cough and hematochezia. On 04-MAY-2008 the patient was diagnosed with gastrointestinal bleed and abdominal cramping. On 22-MAY-2008 the patient was diagnosed with Crohn's exacerbation and on 08-JUN-2008 rectal bleeding. On 26-JUL-2008, 27-JUL-2008, and 08-SEP-2008 the patient was diagnosed with Crohn's Fla

MedDRA PT Facial bones fracture, Fall, Loss of consciousness, Syncope

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. It has been received from a physician concerning a 13 year old female with none preexisting illness who on 17-APR-2009 was vaccinated intramuscularly into the left arm with the second 0.5ml dose of GARDASIL (lot # 661846/1312X). Concomitant therapy included the first dose of MENACTRA (Lot # U2877AA), given intramuscularly into the right arm, Post vaccines administration the patient experienced a syncope, fell and fractured nose during syncope event (hit office counter during fall). On an unspecified date a X-ray of nasal bones was performed (results not provided). The listing indicates that one or more of the events required ER visit. At the time of the report, the patient had recovered. The VAERS ID # 344486. In follow-up received 22-JUN-2009, a physician reported that "a few months ago", when a 15 year old female was given 0.5 ml dose of GARDASIL, the child passed out and fell face first resulting in a broken nose. The patient was brought to an unspecified hospital but was not admitted. An x-ray was performed (results not reported). On an unspecified date, the patient recovered. The doctor reported this to VAERS back when it happened. The doctor does not wish to be contacted about this adverse experience. This is a consolidation of two reports concerning the same patient. No further information is available.

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. On 08-JUN-2007, a 12 year old female with a history of idiopathic thrombocytopenia purpura (ITP) was vaccinated with the first dose of GARDASIL (route and vaccination site not reported) and a dose of VARIVAX (Merck) (route and vaccination site not reported). Concomitant therapy included MENACTRA given also on the same date. On 16-AUG-2007, the patient was vaccinated with the second dose of GARDASIL via intramuscular route into her right arm (lot # 658488/0930U). The patient was diagnosed with encephalitis etiology unknown. Five weeks after administration the patient experienced stiffness of neck, neck pain, back pain, lethargy, no appetite fever for 7 days, then began having seizures which lead to respiratory failure. 1 1/2 year later seizures are ongoing and numerous developmental problems due to brain atrophy. On 13-MAY-2009, the patient's records were received which concern her emergency room (ER) visit on 22-SEP-2007. The patient had a past medical history of idiopathic thrombocytopenia purpura (ITP). The patient presented with complaint of one day history of fever, sore throat and right-sided neck pain. She was diagnosed with viral pharyngitis, right cervical adenopathy most likely due to viral etiology. The patient had an office visit on 26-SEP-2007, with complaint of fever and sore throat, stiff back and shoulders for 4 days, tiredness, decreased appetite, no neck pain. The patient underwent a throat culture which result was negative. The patient had an office visit on 08-JUN-2007: the patient had an immunization visit and received GARDASIL, MENACTRA and VARIVAX (Merck). Assessment: viral infection, pharyngitis. On 20-MAY-2009, ICD-9 codes were received: Infection and inflammatory reaction due to other internal prosthetic device/implant/graft; Unspecified delay in development; Surgical operation, anastomosis/bypass/graft, with abnormal reaction/later complication, no surgical

Seriousness: HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abasia, Arthralgia, Back pain, Gait disturbance, Inflammation, Juvenile arthritis, Laboratory test, Musculoskeletal pain, Pain in jaw, Pelvic pain

Symptom Text: Initial report received on 26 May 2009 from another manufacturer, report # WAES0905USA01139. The initial reporter to the manufacturer had been a health care professional. Verbatim from the report: "Information has been received from a nurse practitioner concerning her 18 year old daughter who on 29-AUG-2007 was vaccinated with her first dose of GARDASIL. Concomitant therapy included MENACTRA. On approximately 05-SEP-2007 the patient experienced lower back, butt, pelvis, and hip pain. The patient was hospitalized from 28-DEC-2008 to 31-DEC-2008 because she could not walk. She had since been diagnosed with juvenile rheumatoid arthritis. The reporter considered the events to be disabling. Follow up information was received from this nurse practitioner. She reported that her daughter on 29-AUG-2007 was vaccinated with GARDASIL (Lot # 658222/0927U). Secondary suspect therapy included MENACTRA (U2381BA). Within a week of the two vaccinations the patient complained of pain in the jaw, lower back, pelvis, hips and buttocks. The symptoms became more severe in about 3.5 months. By December of 2007, the patient had two episodes of difficulty walking and needed help to walk. The patient had an MRI which revealed inflammation with no confirmed diagnosis. The patient was hospitalized in December 2007. In January of 2008 the patient was seen by an Orthopedic Specialist. The patient received joint injections and had a bone marrow biopsy. The patient was also seen by an Oral surgeon and received jaw injections, IM and methotrexate injections, SC. In March of 2008, the patient was seen by a Pediatric Rheumatologist. The nurse stated that she thought that the Rheumatologist reported the case about her daughter to the CDC. The patient was started on HUMIRA injections, IM and methotrexate injections, SC. In June of 2008, the patient was started on REMICADE by infusion every 4 weeks. Laboratory evaluation were performed every 4 weeks. The patient did not have another episode where she could not walk but the patient was never pain free

MedDRA PT Anaemia of pregnancy, Drug exposure during pregnancy, Inappropriate schedule of drug administration, Uterine atony

Symptom Text: Information has been received from a registered nurse and a staff member in a office, for the pregnancy registry for GARDASIL, concerning a 24 year old female with renal disease - glomerulonephritis, post partum anemia and history of 5 previous pregnancies, 4 live births, 1 spontaneous abortion who on 20-Sep-2006 was vaccinated with the first dose of GARDASIL (lot# 653735/0688F). On 05-Apr-2007 the patient delivered a normal, healthy male baby (WAES# 0707USA01442). On 20-Nov-2006, the patient was vaccinated with dose of FLUVIREIN (lot# 7135). On 13-Jul-2007 the patient was vaccinated with the second dose of GARDASIL (lot# 657868/0523U). The patient was pregnant, patient's date of last menstrual period was 04-Feb-2008, estimated delivery date 10-Nov-2008. Medication used during pregnancy included prenatal vitamin, iron. On 13-May-2008 24 hour urine cr / cl (creatinine clearance) was performed due to history of renal disease with result WNL. On 05-Sep-2008 ultrasound was performed due to history of renal disease with result within normal limit (WNL). On 11-Sep-2008 non stress test (NST) was performed with result reactive/reassessing. Patient declined MSAFP testing. On 04-Nov-2008, the patient was admitted to the hospital for a repeat C-section and delivered a normal, healthy female baby weighing 7 pounds 11 ounces at 39 week and 1 day pregnancy. The agars score test was preformed with result 9/9. The patient was diagnosed with uterine atony after the delivery of the baby on 04-Nov-2008 and was treated with METHERGINE injection. The patient was also diagnosed with post partum anemia from which she recovered (not considered to be life threatening; no date provided, she had this with a previous pregnancy as well) the patient was discharged from the hospital on 07-Nov-2008 and therefore did not require prolonged hospitalization for any reason. On 20-Nov-2008 the patient was vaccinated with the third dose of GARDASIL (lot# 661531/1311X) No further information is available.

MedDRA PT Convulsion

Symptom Text: Information has been received from a physician concerning a 11 year old (also reported as 15 year old) female with allergy to penicillin (PCN) and POLYTRIM eye drops and a medical history of syncope (cleared by neurologist and cardiologist) who on 14-MAY-2009 was vaccinated IM with the first 0.5ml dose of GARDASIL (lot# 660616/0570X). Concomitant therapy included MENACTRA (lot# U2875AA). The physician reported that the patient received the first dose of GARDASIL "2 months ago" (on 14-MAY-2009). The office was busy and was unable to observe the patient after vaccination (was not observed for 15 minutes post vaccination). When the patient went to the car, she had a 30-second seizure in the parking lot. No treatment was required. The patient recovered. The patient's mother sought medical attention through a telephone call. Upon internal review, seizure was determined to be an other important medical event. Additional information is not expected.

MedDRA PT Amnesia, Catatonia, Communication disorder, Convulsion, Dissociation, Dyspnoea, Fatigue, Headache, Hyperventilation, Palpitations, Respiratory arrest, Social avoidant behaviour, Unresponsive to stimuli, Vaccine positive rechallenge

Symptom Text: Shortly after her first shot patient started having episods of what we thought were panic attacks. She had a hard time breathing, her heart would race and she could not catch her breath. After the second shot this so called panic attacks seemed to get worse and she was having them more freqently. She was tired all the time and a bit withdrawn. She had her third shot on June 9th of 2008 and on June 12th I saw one of these episods for the first time. I was stunned. This was no panic attack. She knows it going to happen she get a real intense pain on the top right side of her head. Usually within 30 to 60 seconds of the pain she becomes completly catatonic like. She is unable to comunicate at all. Then she goes into seizure like activity. But, during these seizures she goes into a breathing pattern, she will seizure like activity for about 45 seconds and then she will stop breathing for anywhere from 30 to 40 seconds and this will continue for anywhere from 2 mins to 50 mins. This has been going on for almost a year. She will have these episodes anywhere from 2 to 4 a week. 6/25/09 Hospital records and DC summary received DOS 6/4/09 to 6/9/09. Assessment: Paroxysmal disturbance, etiology indeterminate. Patient presents with stereotypical episodes consisting of sharp stabbing incapacitating discomfort in right parietal or temporal area. Hyperventilation, irregular breathing, unresponsive, dissociated, amnestic. Gardasil Dose #1 (0211U) LA 8/13/07 Gardasil Dose #2 (1266O) RA 1/21/08

MedDRA PT Drug exposure during pregnancy, Foetal disorder, Inappropriate schedule of drug administration

Symptom Text: Information has been received from a physician via CSL as part of a business agreement (manufacturer control # GARD 2008 07 02 001) concerning a 20 year old female with a history of 1 pregnancy and 1 live birth who on 03-JAN-2008 was vaccinated with the first dose of GARDASIL. On 25-JUN-2008 the patient was vaccinated with the second dose of GARDASIL (considered inappropriate schedule of vaccine administration). On 30-JUN-2008 the patient found out that she was 4.5 weeks pregnant. No adverse event was reported. Follow-up information has been received from a completed First Encounter Questionnaire. The date of the patient's last menstrual period was 26-JUN-2008. The patient's pregnancy was confirmed by a urine test. The estimated delivery date is 04-MAR-2009. No further vaccination was administered following the second dose of GARDASIL. Follow-up information has been received from a completed Use in Pregnancy - Pregnancy Outcome Questionnaire. It was reported that the patient did not had any diagnostic tests and the patient had not taken any prescription drugs during her pregnancy. It was also reported that the patient did not have any infections/illnesses during her pregnancy. The patient did not have any complications during pregnancy, labor or delivery. On 28-FEB-2009, the patient had a liveborn female baby weighing 3.1kg who was found to have bilateral talipes positional. The infant did not have any complications other than congenital anomalies. The reporter did not specify whether the infant's bilateral talipes positional was related to therapy with GARDASIL or not. Additional information is not expected.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse practitioner (N.P.), for the Pregnancy Registry for GARDASIL, concerning a 23 year old female with no pertinent medical history, drug reactions or allergies who on 30-APR-2008 was vaccinated intramuscularly with a first 0.5 ml dose of GARDASIL (Lot #656372/0243U). There was no concomitant medication. Subsequently the patient was discovered that she was pregnant. On 05-AUG-2008 a urine pregnancy test was performed at the office and result was positive. Her LMP was 19-JUN-2008. Expected date of delivery was 26-MAR-2009. No adverse effects were reported. The patient had office visit. Follow-up information was received from the N.P. indicating that the patient terminated her pregnancy. The date of the termination was not available. No further information was provided. Upon internal review, pregnancy termination was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Conversion disorder, Crying, Dizziness, Headache, Syncope

Symptom Text: Information has been received from a health authority concerning a 12 year old female adolescent who on 24-MAR-2009 was vaccinated with a second dose of GARDASIL (lot # 1648U; batch # NH55600, site of administration not reported) and one dose of TWINRIX 720/20 (batch # AHABB144AD, site of administration not reported). Both vaccines were administered by intramuscular route. Before leaving the physician office after vaccination the patient experienced orthostatic syncope lasting for approximately 15 seconds (also reported as 5 seconds). She recovered quickly when legs were put in an elevated position. The patient left the doctor's office 15 minutes after vaccination. 10 minutes later she revisited the doctor's office, complaining about headaches, dizziness, hysterical excitement and crying abnormal. The circulation was always stable. The patient was hospitalized. Subsequently the symptoms disappeared completely and the girl was discharged from hospital. Duration of hysterical excitement, crying abnormal and dizziness reported as 2 hours. On 31-MAR-2009 her doctor reported ongoing headache (outcome not reported). The patient was otherwise healthy and does not take any medication, drugs or alcohol. All vaccinations were well tolerated to date. Causality as per HA of GARDASIL was possible to all events, of TWINRIX was possible to all events except hysterical excitement that was assess as probable. Other business partner's numbers includes: E2009- 03918. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abdominal pain, Chest pain, Chills, Cough, Gait disturbance, Hyperaesthesia, Myalgia, Nausea, Pain in extremity, Pyrexia, Tremor, Urine colour abnormal

Symptom Text: The day after the HPV vaccination patient started to complain of pain in both arms at appprox 5:30 PM on May 6, 2009. Within 20 minutes she had pain in both arms and both legs. Within another 10 minutes she had pain in her arms, legs, chest, and abdomen. Her hands curled into claws due to the severe amount of pain. We rushed her to the hosital were she was taken in immediately and started on IV pain medication. She had also developed a fever and nausea. Blood and urine tests were clean. She stayed on IV pain medication for another 2 hours or so and then was released with a bottle of vicodin to take every four hours. She had diminishing pain for the next four days. Her family physician said that this "might" be a reaction to the HPV injection and recommended that no further injections of Gardisil be administered. Exactly two weeks later patient had a relapse with associated arm and leg pain, fever and nausea. A return trip to the family Doctor left us with no further explanation than prescriptions for 800 mg Ibuprofin, muscle relaxers, antiinflamitories, and nausea medication and the suggestion that we see a neurologist. Is there an antidote to Gardisil? 6/4/09 ER records received DOS 5/6/09. FINAL DIAGNOSIS: Myalgia. Post vaccination presented with chest and full body pain. Pain occures when touched. Shaking, chills, cough. Painful to walk. States she has dark colored urine.

Other Meds: 6/4/09 ER records received DOS 5/6/09. Dilaudid, Zofran, Vicodan. Flovert, albuterol, guaifenesin.

Lab Data: 6/4/09 ER records received DOS 5/6/09. Blood, Urine. LABS and DIAGNOSTICS: CBC - Neutrophils 73.2% (H) Lymphocytes 17.3% (L). Urinalysis WNL.

History: Mild Asthma. 6/4/09 ER records received DOS 5/6/09. Allergies to: Bees, pineapple, cephalosporins. Asthma, seizure, tonsillectomy.

MedDRA PT Abdominal pain, Chest pain, Chills, Chromaturia, Cough, Feeling hot, Full blood count, Laboratory test normal, Metabolic function test, Nausea, Pain, Pain in extremity, Pain of skin, Tremor, Urine analysis

Symptom Text: Information has been received from a consumer concerning his daughter, a 13 year old female who was allergic to pineapple and CEPHALOSPORIN and with a mild asthma, received the first dose of GARDASIL on 05-MAY-2009. Concomitant therapy included FLOVENT. On 06-MAY-2009, the patient experienced severe pain in both arms, legs, chest, and abdomen. Her skin could not be touched because she was in so much pain. She was taken to the Emergency Room where she was given pain medication and tests were done for 5 hours. All tests came back negative. About 3-4 days the pain seemed to have gone away. On 20-MAY-2009, the severe pain came back. The patient would not be receiving her second or third dose of GARDASIL. No lot number was provided. At the time of reporting, the patient's severe pain persisted. Follow- up information has been received from a medical assistant who stated that the lot # of GARDASIL was 661952/1129X. The patient received the following vaccines concomitantly on 05-MAY-2009: MENACTRA, (lot # U2875AA) and BOOSTRIX, (Lot # AC52B030AA). On 06-MAY-2009 the patient went to a hospital and complained of shaking, chills, cough and dark colored urine. The patient was treated with IV fluids, DILAUDID and ZOFRAN. The patient had a urine analysis test and a CBC blood test (results not reported). The patient was not admitted to the hospital. On 07-MAY-2009 the physician evaluated the patient. The patient did not received any treatment at the time. On 22-MAY-2009, the patient was seen by the physician's assistant. The patient stated that she was improving but had body aches, nausea, and had a warm feeling with no associated fever. The patient had a CBC, Complete Metabolic Panel (CMP) and CK blood tests. The patient's CK was slightly lower than normal (other results not reported). The patient was not treated at the time. The patient was referred to a neurologist. Additional information has been requested. The patient was seen at hospital.

Seriousness: EXTENDED HOSPITAL STAY, SERIOUS

MedDRA PT Drug exposure during pregnancy, Foetal growth retardation, Premature labour, Vaginal laceration

Symptom Text: Information has been received from a physician concerning a 19 year old female with no known medical history, allergies or drug reactions who in March 2007, was vaccinated with the first dose of GARDASIL (lot no. route and site not reported) second dose (lot no. route and site not reported) was given in May 2008. There was no concomitant medication. No adverse effects were reported. Subsequently, she became pregnant. The patient's LMP was in April 2008. On 10-JAN-2008 the patient delivered a baby. No laboratory tests were performed. Follow-up information has been received from a nurse who reported that the patient had received the first and second doses of GARDASIL on 13-MAR-2007 and 17-MAY-2007 at another practice. The nurse confirmed the LMP was in April 2007 and the EDD was 25-JAN-2008. The nurse reported that the patient had come late in her pregnancy at 33 weeks of gestation. The nurse reported that the patient was admitted to the hospital on 12-DEC-2007 for preterm contractions and intrauterine growth restriction (IUGR). The nurse did not know how long hospitalization lasted. The nurse stated that the patient delivered early on 10-JAN-2008. It was a vaginal delivery with repair of a laceration. The patient was discharged from the hospital on 12-JAN-2008 following the birth. The patient did not return for her postpartum visit. The patient was seen in July 2008 for a non-pregnancy issue and her annual exam in December 2008. The nurse reported that the baby "seemed to be doing well", no problems were reported for the baby. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Back pain, Encephalomyelitis, Hyporeflexia, Paraesthesia, Paralysis flaccid, Sensorimotor disorder

Symptom Text: Information has been received from health authorities (reference number RN20080332), concerning a 14 year old female patient (weight=55kg, height =160cm), other relevant history not reported who on 19-MAY-2008 was vaccinated intramuscularly with a first dose of GARDASIL 0.5mL (batch number not reported). During the week end of 28-JUN-2008 and 29-JUN-2008, she suffered from paraesthesia of her lower limb. Dorsal pain were persisting. On 03-JUL-2008 she developed a flaccid paralysis of lower limbs with sensori-motor deficit, sphincter troubles and suppression of tendon reflex of lower limbs leading to establish a diagnosis of GUILLIAN BARRE SYNDROME. At the time of reporting the patient had not recovered. Follow up information has been received for the Health Authorities on 14-MAY-2009: The patient's date of birth was added. Further investigation were performed with electromyography. The results called into question the previous diagnosis. The accepted diagnosis was now post-infectious acute encephalomyelitis. The patient's condition was slowly improving as she was hospitalized. At the time of the reporting, the outcome was unknown. The Health Authorities assessed the causal relationship between the reported reactions and vaccination as doubtful (C1 S1 I) according to the method of assessment. Other business partner numbers included: E2008-08280. The case is closed. No further information is available.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Dizziness, Fall, Gait disturbance, Hypoaesthesia, Joint injury, Mobility decreased, Muscle spasms, Myalgia, Pain in extremity, Paraesthesia

Symptom Text: Patient received the HPV vaccine in the late afternoon of Wednesday, May 6, 2009. Early on Thursday morning she woke up with pain in her right leg which had started during bedtime. She went to school, and there patient experienced severe pain in her right leg accompanied with pain and numbness on her left arm. she said she couldn't move her forearm and her ring and pinky fingers fo a period of about 5 minutes. About an hour later, around 9 to 9:30 a.m. patient had such pain in her right leg that she fell down. That pain was accompanied by spams in her lower leg and in her foot and toes. She could not walk without help and she was taken to the school nurse from where they called patient's mother. Mother picked her up in less than 20 minutes and took her to the ER. No tests (blood nor ultrasound) were performed. She was given Motrin for the pain and was dismissed with instructions to see pediatrician if she got worse. From Friday through Sunday patient stayed home resting her leg. She had pain on and off and she had difficulty walking most of the weekend. On Monday, May 11, at school, patient's pain got severe again, Mother picked patient up and took her to the pediatrician. Pediatrician ordered blood to be drawn for tests and said she would refer patient to a specialist. On Tuesday, May 12, patient's pain was so severe that she was taken in a wheelchair from the classroom to the nurse's office. Mother picked her up and had to take her home since specialists were not going to see her until the coming week. On Wednesday, May 13, patient had severe pain in the morning while at school, she fell down, Mother picked her up from nurse's office where they had lent her a pair of cruthches to be able to get to the car. Parents called pediatrician to request testing to rule out DVT and parents requested an order for crutches for patient to be able to move around in school. Thursday, May 14, patient was still in pain, and was taken for an ultrasound. No DVT was found. Friday, May 15, patient was able to stay in school with t

Other Meds: 6/4/09 Hospital records received DOS 5/7/2009 and 5/18/09. Motrin. Tylenol. Several years previously - oxandrolone, Lupron.

Lab Data: Normal Ultrasound of the bilateral lower extremity venous system. Normal comprehensive metabolic panel, normal sed rate, normal cbc, normal rheumatoid factor, normal c-reactive protein, negative anachoice screen. 6/4/09 Hospital records

History: 6/4/09 Hospital records received DOS 5/7/2009 and 5/18/09. Evaluation for short stature. Seizure-like activity when very young.

MedDRA PT Convulsion, Dizziness, Dyskinesia, Electroencephalogram abnormal, Hyperhidrosis, Nausea, Pallor, Syncope

Symptom Text: Information has been received from a Nurse practitioner concerning a 17 year old female patient with no pertinent medical history and with no known drug reactions/allergy who on 19-MAY-2009 was vaccinated with a first and only dose of GARDASIL (route unspecified and lot number: 661953/1130X). Concomitant vaccinations on 19-MAY-2009 included a dose of (lot number: U2842AA) MENACTRA, a dose of ADACEL (lot number: UF452CA). Other concomitant therapy include loratadine (unspecified date). The nurse practitioner reported that after the patient's vaccination on 19-MAY-2009, she experienced seizure. An electroencephalography (EEG) was reported as abnormal (also reported as negative). The patient was referred to a Neurologist who suggested the event was due to anxiety/nervousness. While in the physician office on 29-SEP-2009, the patient refused subsequent vaccination with GARDASIL, due to the seizure. It was reported the patient did not need treatment and that she recovered by the time she left the office on 19-MAY-2009. Upon internal review, seizure was determined to be an other important medical event. Additional information is not expected. 10/13/09 Vaccine records received.

Other Meds: loratadine

Lab Data: electroencephalography, abnormal-negative results. Labs & Diags: EEG- A few sharp waves L temporal region.

MedDRA PT Drug exposure during pregnancy, Neonatal disorder

Symptom Text: Patient came in on 8/12/08 for Gardasil and Varivax. Patient was counseled for pregnancy. Patient called on 5/21/09 and stated that she had been pregnant on 8/12/08 and did not know it. She stated she had not missed her period yet when she came in for the vaccinations so she did not think she was pregnant at the time. She delivered twin boys at on 3/23/09 but her EDC was 4/13/09. Baby A weighed 5 pounds 10 ounces at birth and Baby B weighed 5 pounds 7 ounces. Patient took Baby A to pediatrician on 4/27/09 with what she thought was a respiratory illness. Doctor heard a murmur and upon further evaluation was admitted to hospital and flown to another hospital. Infant was diagnosed with Total Anomalous Pulmonary Venous Return and had surgery on 4/29/09. Infant was discharged from the hospital on 5/4/09. Baby B was found to have an innocent heart murmur. Patient also has a 5 year old son and 2 year old daughter who are healthy.

Other Meds: None

Lab Data:

History: Client states she has an allergy to Ibuprofen but no other medical conditions or birth defects.

Prex Illness: Denies any illness at time of vaccination.

MedDRA PT Rash pruritic, Urticaria

Symptom Text: Information has been received from a physician concerning a 16 year old female with seasonal allergy and no know drug allergies who on 11-MAY-2009 was vaccinated intramuscularly in the left arm with first dose of GARDASIL (lot number 662229/1497X). Concomitant therapy included ALLEGRA and NASONEX. Within one or two days after vaccination, on approximately 12-MAY-2009, the patient experienced rash and hives on the left arm that was also pruritic. The physician believed that the patient using BENADRYL was an intervention to prevent serious criteria. As of 20-MAY-2009, the patient was recovering. The patient sought medical attention by making a phone call. The reporting physician considered the pruritic rash and hives to be other important medical events. Additional information has been requested.

MedDRA PT Expired drug administered, Fall, Hypotonia, Loss of consciousness, No reaction on previous exposure to drug, Syncope, Vision blurred

Symptom Text: Initial report received on 21 April 2009 from a health care professional. An 11-year-old female patient had received a first dose of ADACEL (lot number UF455BA, Lot number C3044), a first dose of MENACTRA (lot number U2866AA) and a dose of GARDASIL (manufacturer Merck, lot number not reported) on 21 April 2009. The routes and sites of administration were not reported for any of the vaccines. After receiving the vaccine (time not reported) the patient "went limp;" and was caught by the physician as she fell to the ground. There was no loss of consciousness, but the patient had blurred vision prior to the collapse. It was not reported whether any diagnostic tests or laboratory data were performed. The recovery status of the patient was not reported. Follow up information received on 15 June 2009 from a health care professional who stated the patient did not have a medical history or prior reactions with past vaccinations. The patient received GARDASIL (manufacturer Merck, lot number 0650X) which was noted to have an expiration date of 18 February 2009. ADACEL, MENACTRA, and GARDASIL were all received intramuscularly. The onset time of the symptoms was 2 minutes post vaccination. The reporter stated that the patient recovered after sitting down. No further information was reported. Follow-up information received on 02 and 07 July 2009 from a health care professional and a physician respectively. From the following information received, the case was determined to meet seriousness criteria and was upgraded to serious. Per the reporters, It was unknown which "deltoid muscle" the vaccines were administered into at the well child visit on 21 April 2009. After receiving the vaccines on 21 April 2009, the patient dropped into the nurse's arms losing consciousness for approximately three seconds. No diagnostic tests or laboratory data were completed or performed as they were not needed. The final diagnosis was determined to be syncope. Documents held by sender: None.

Symptom Text: Information has been received from a physician concerning a 21 year old female with partial hearing loss due to congenital sensory nerve damage, irritable bowel syndrome and gastrooesophageal reflux disease and a history of gastric ulcer perforation who was vaccinated IM with the first dose of GARDASIL, 0.5ml on 15-JUN-2007. There was no concomitant medication. Starting on 22-JUN-2007 the patient experienced migraine headaches and palpitations. In October 2007 the patient received her second IM dose of GARDASIL 0.5 ml, but has not had her third dose. In January 2008, the patient started having syncopal episodes and pseudoseizures. The patient, who was born with hearing loss due to sensory nerve damage, lost her remaining hearing in March 2008. Since the beginning of 2009, the patient had experienced episodes of behavioral regression as well as muscle pain and weakness. Due to the muscle weakness, the patient had limited ambulation. Since April 2009 the patient had recurrent nosebleeds. The patient has required multiple hospitalizations and office visits. The patient had MRI/MRA of head, CT Scan/CTA of head, EEG, echocardiogram, lumbar puncture and angiogram performed (results not reported). At the time of the report (on 18-MAY-2009) the patient was not recovered. The reporter considered the events to be disabling. Additional information has been requested. 7/9/09 Medical records received DOS 6/5/07 to 10/5/07. Patient complains of vaginal odor.

Other Meds: None

Lab Data: Unknown. 7/9/09 Medical records received DOS 6/5/07 to 10/5/07. LABS and Diagnostics: All pending. PAP, GC, Vaginitis Panel, Thyroid panel, Glucose, endocrine studies.

Symptom Text: Information has been received from a consumer concerning her 21 year old daughter with "immune deficiency runs in family" who on 15-JUN-2007 and on 15-OCT-2007 was vaccinated with first dose (route not reported, lot number 0469U) and second dose (route not reported, lot number 654539/0742U) respectively of GARDASIL. The patient's mother reported that her daughter has been severely ill since receiving the second dose of the vaccine. It was reported that on 17-OCT-2007, the patient's symptoms started with chest pain, migraines, fainting, facial flushing, seizure and nausea. It was reported that she now has emotional regression and spectrum disorder, swelling of legs and feet, inability to walk, pain all over her body, felt "shocks to her brain", clonic tonic symptoms, hair loss, foaming from mouth, nosebleeds, hallucinations, hearing loss, weight gain, shaking like PARKINSON's disease, acid reflux, irritable bowel and high testosterone levels. She reported that her daughter was gone to the hospital over fifteen times and had been admitted nine times to three different hospitals. The patient has been seen by many doctors including neurologist and neuropsychiatrist. She had also had alternative medicine treatments including detoxification, cranial massage and reflexology. It was reported that she was now using a wheelchair and needed to be carried. Lab tests performed included lumbar puncture, cerebral angiogram, EEG and many others which were all negative. As of 19-JUN-2009, the patient had not recovered from the events. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Syncope

Symptom Text: Information has been received from a physician concerning a 13 year old female with cerebral palsy, hydrocephalus and shunt which has became occluded about a year ago and who was a premature infant (24 weeks, weight 11 pounds) who "a couple of months ago" was vaccinated with a dose of GARDASIL (dose, route and lot number not reported). Two weeks later, the patient had a "syncopal episode and possibly seizure". It was reported the patient improved, she did not have any more episodes since. The neurosurgeon told the patient's parents that he could not rule out GARDASIL as a possible cause of the episode. The patient sought unspecified medical attention. Upon internal review possibly seizure was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a female concerning her daughter, for a pregnancy registry for GARDASIL, who on an unspecified date was vaccinated with the first dose of GARDASIL. The reporter stated that the patient did not know at the time of the vaccination that she was pregnant. The patient had the baby 3 weeks after the vaccination. It was reported the patient sought unspecified medical attention. It was reported that the baby died. The patient was 9 weeks pregnant. Upon internal review, baby died at 9 weeks was determined to be an other important event. No further information is available.

Seriousness: ER VISIT, LIFE THREATENING, SERIOUS

MedDRA PT Convulsion, No reaction on previous exposure to drug

Symptom Text: Information has been received from a pharmacist concerning a 19 year old female with no pertinent medical history who was vaccinated with the second dose of GARDASIL (lot#, dose, route and site of administration not reported). There was no concomitant medication. The patient experienced seizures after receiving the second dose, and she went to an emergency room for treatment. The patient recovered from seizure. Seizure was considered to be life threatening by the pharmacist who stated that this case might have been already reported by the patient's physician. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Bradycardia, Dizziness, Heart rate decreased, Hyperhidrosis, Hypotension, Immediate post-injection reaction, Orthostatic hypotension, Pallor, Presyncope, Syncope

Symptom Text: Immediately after administering the vaccine, the patient experienced near-syncope: pallor, diaphoresis, hypotension and bradycardia. This lasted over 1.5 hours until she was transported by EMS to the ED. Her BP baseline was 125/75 with pulse 108, but during the event BP was 80's/50's with pulse in the 50's. Standing caused dropping of BP and pulse and diaphoresis and near-syncope. 7/7/09 ER records received DOS 5/22/09. Assessment: Vasovagal Syncope. Patient instantly developed lightheadedness and had syncopal episode. Presented with low blood pressure and pulse.

Other Meds: Vyvanse - not taken on day of vaccine

Lab Data:

History: allergy to fruit; attention-deficit disorder; Kawasaki disease as a child that led to coronary aneurysm that completely resolved per cardiologist. 7/7/09 ER records received DOS 5/22/09. ADD, T&A.

MedDRA PT Arthropathy, Electromyogram normal, Injection site oedema, Injection site reaction, Mononeuritis, Paraesthesia

Symptom Text: Information has been received from a health agency (case n. 98687) (Local case n. IT205/09) concerning a 12 year old female patient who on 22-APR-2009 was vaccinated with the third dose of GARDASIL IM In the right deltoid (batch#: NJ21670; lot#: 1882U). No other vaccines administered during the 4 weeks prior to vaccination. On the same day 22-APR-2009 the patient presented with an adverse reaction for which she was evaluated at the vaccination clinic and admitted to the hospital on the following day (23-APR-2009). She was discharged on 26-APR-2009 with the diagnosis of circumscribed edema and mononeuritis of the upper right limb. She was treated with prednisone and paracetamol. On 06-MAY-2009 an electromyography was performed in day hospital and resulted within limits, however objective exam revealed a persistence of paresthesia and disturbance of the metacarpal and interphalangeal section of the right hand precluding the normal opposition of the thumb and index. At the time of reporting the patient's condition had improved. The final outcome was not reported. Other business partner numbers include E2009-04191. The case is closed.

MedDRA PT Sudden hearing loss, Vertigo, Vomiting

Symptom Text: Information has been received from a health professional concerning a 15 year old female who on 10-MAR-2009 was vaccinated with a first dose of GARDASIL (lot# 1883U, batch # NH50860, intramuscularly in right upper arm). On 06-MAY-2009 the patient experienced vertigo that aggravated within 1.5 hours. The patient vomited after feeling as if sitting on a swing moving backwards and as if the entire room had a heavy list to the right. She also experienced a sudden hearing loss on the right ear. The patient was examined at the Ear, Nose and Throat at the hospital, where it was established that the problem originated from the auditory organ and that there was no brain damage. The patient was hospitalized at the children's clinic for a data tomography (DT, normal) and a lumbar puncture (quick test was normal). The hospital will return the final results of the lumbar puncture. Due to the hospitalization the case was considered serious. The outcome was at the time of reporting not yet recovered. Case is closed. Other business partner numbers included E2009-04117. Additional information has been requested.

MedDRA PT Chills, Headache, Nausea, Pain, Pyrexia

Symptom Text: Initial information received from a foreign Health Authority (Reference number ES-AGEMED-524959332) on 11-MAY-2009 regarding an 18 year old female who was administered on the 06-APR-2009 the second dose of a GARDASIL (Lot not reported), route and site not reported. One day after vaccine administration, on 07-APR-2009, the patient presented a frontal progressive cephalea, fever and nausea. It is also reported that the patient had shivers, events did not stop after taking GELOCATIL. The patient was hospital admitted on an unspecified date, a lumbar puncture was performed. The patient was diagnosed with a febrile clinical picture after vaccination with GARDASIL and with pain after lumbar puncture. Cephalea, fever and nausea are the only adverse events coded in the Health Authorities report. The patient recovered on April 2009, exact date not reported. According to the regional pharmacovigilance center this case was notified by fax on 30-APR-2009 by GSK (possible mistake, they are referring to agency). "Further information is expected when we receive the case through the electronic transmission" is written in the Health Authorities report. This case is probably a duplicate of case WAES: 0904USA03703 (E-2009-03957). Confirmation from the Health Authorities is pending. Other business partner numbers include E2009-4128. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Headache, Hypoaesthesia, Syncope, Vomiting

Symptom Text: Information has been received from a pharmacist, via CSL as part of a business agreement (manufacturers control No. CSL 2009 03 10 LS 2) concerning a female student who on approximately 10-FEB-2009, "approximately four weeks ago" was vaccinated with GARDASIL as part of a school vaccination program. Subsequently the patient fainted. At the time of reporting on 10-MAR-2009, the patient had fully recovered. The vaccination program included approximately 100 students and there was one other adverse event reported of a female who was hospitalised (NWAES 0903AUS00045). Follow up information has been received from a pharmacist. The patient was reported as a 12 year old female with no previous allergies who in March 2009, was vaccinated with GARDASIL. Subsequently, in March 2009, the patient fainted, started vomiting, had a numb arm and headache and was hospitalized. Subsequently, 72 hours later, the patient recovered from fainting, vomiting, numb arm and headache. Additional information has been requested.

MedDRA PT Chest pain, Diarrhoea, Dyspnoea, Headache, Pyrexia, Viral infection

Symptom Text: Information has been received from a nurse practitioner concerning a 23 year old female with papanicolaou smear abnormal and a colposcopy (21-MAY-2009), who on 21-MAY-2009 was vaccinated with 0.5 ml of the first dose of GARDASIL (Lot. 661953/1130X), no other vaccine was administered at the same time. Concomitant therapy included multiple vitamins (unspecified). On 24-MAY-2009, the patient experienced a headache, slight diarrhea and fever. The patient went to the emergency room (ER), but was not admitted. The patient did not have a urinary tract infection (UTI) or a cervical infection. Her white blood cell count (WBC) was normal. The ER's discharge summary stated, "viral illness". On 26-MAY-2009, the nurse practitioner spoke with the patient who reported an intermittent fever of about 100 degrees, chest pain and some difficulty breathing. The patient was told to contact her primary care physician. At the time of this report, the patient's status was unknown. Additional information has been requested.

MedDRA PT Infection susceptibility increased, Tension headache

Symptom Text: Information has been received from a Health authority (reference number PEI2009009794) concerning a 16 year old female who on 12-JUL-2007 was vaccinated with the first dose of GARDASIL (lot number, injection route and site not reported). In autumn 2007, the patient developed chronic tension headaches and increased infection susceptibility. The patient was hospitalized on an unspecified date. Thorough investigation including physical examination, MRI and X-ray showed normal results. Sinusitis, tumor, inflammatory events, migraine, epilepsy and metabolic disorder were ruled out. But a postural deformity was diagnosed (not otherwise specified). As tat the time the complaints were not attributed to the vaccination, the second dose of GARDASIL (lot number 1536F and batch number NG01520) (injection route and site not reported) was administered on 05-NOV-2007. The symptoms were persisting after this second dose. The patient has not recovered at the time of reporting. The case was closed. Other company numbers included: E2009-04168. No further information is available.

MedDRA PT Convulsion, Dizziness, Vertigo

Symptom Text: Information has been received from a certified medical assistant concerning a 17 year old female who on 17-MAR-2009 was intramuscular vaccinated with the first 0.5ml GARDASIL vaccine (Lot # 661846/1312X). The patient has no medical history. There was no concomitant medication. Approximately 6 weeks after administration, the patient developed a "seizure-like activity" and "dizziness" when she was getting out of the bathtub. She saw a neurologist and had an MRI which was negative. The patient now has occasional vertigo. The patient was considered to be recovering at the time of the report. The patient has not received any additional doses yet. Follow up information has been received from this certified medical assistant. She reported that no other vaccines were administered at the time of GARDASIL dose. She could not confirm that the patient actually had a seizure (stating that "seizure-like activity" was what was reported by the patient's mother), and could not give a more definitive AE onset date. Upon internal review, "seizure-like activity" was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Carcinoma in situ, Cervical dysplasia, Loop electrosurgical excision procedure

Symptom Text: Information has been received from a physician concerning a 22 year old female with no medical history who was vaccinated with her first (lot# 658222/0927U), second (lot# 658222/0927U) and third (lot# 659964/1978U) dose of GARDASIL on 22-AUG-2007, 08-SEP-2007 and 19-MAR-2008, respectively. On 04-MAY-2009 the patient was diagnosed with high grade squamous intraepithelial lesion carcinoma in situ after a PAP test. The patient had a LEEP Procedure done on 15-MAY-2009. The patient sought unspecified medical attention. Additional information received via telephone from a medical assistant on 19-MAY-2009. Medical assistant reported that the patient's second dose of GARDASIL was administered on 08-NOV-2007 (not 08-SEP-2007 as previous reported). There were no concomitant vaccines administered with GARDASIL vaccinations. The medical assistant confirmed that the patient had a PAP smear test on 04-MAY-2009 and had a LEEP on 15-MAY-2009. The reporter did not know the patient's recovery status. The patient did not have a scheduled follow up visit with physician at the time. The reporter considered high grade squamous intraepithelial lesion carcinoma in situ to be an other important event and disabling. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Dyspnoea, Pyrexia, Throat tightness

Symptom Text: Information has been received from a nurse practitioner concerning a 19 year old female who experienced fever a few hours after receiving the first dose of GARDASIL. The patient received the second dose of GARDASIL on 13-MAY-2009 and after a few hours, the patient's mother called in stating that the patient felt like her throat was closing that she couldn't breathe. Lot #'s were not available. Patient was brought to the emergency room but she was not admitted in the hospital. At the time of the report the patient's AE improved. Follow-up information has been received from a nurse practitioner who stated that the patient was treated in the emergency room. The patient was treated with BENADRYL IV and fluids. The patient was not admitted to the hospital. The patient had recovered. Follow-up information received from a medical assistant at the nurse practitioner's office stated that the patient's mother called the office and reported that her daughter felt as if her throat was closing. The physician then advised that the patient be taken to the hospital. Upon internal review, felt like throat was closing and couldn't breath, requiring treatment with IV antihistamine, were considered to be other important medical events. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Breast cancer in situ, Breast mass, Breast tenderness, Inappropriate schedule of drug administration

Symptom Text: Information has been received from an investigator concerning a 35 year old female with no known drug allergies, with HIV and alcohol use who entered a study. On 16-JUL-2008 the patient was vaccinated with the first dose of GARDASIL 0.5 mL via injection. On 11-SEP-2008, she was vaccinated with the second dose of GARDASIL 0.5 mL via injection and the third dose of GARDASIL was administered on 12-JAN-2009. Concomitant therapy included Kaletra, Truvada and Loestrin. Approximate duration of use of concomitant medications was reported as 2 months. On 09-APR-2009, the patient presented to the clinic for a non-study visit with complaints of feeling a lump on her right breast for three weeks. Upon evaluation by provider, the subject was referred for a mammogram for diagnosis. The mammogram was performed on 16-APR-2009 and revealed an abnormality in the right breast that was highly suspicious for ductal carcinoma in situ. On 20-APR-2009 the patient was seen for the right breast lump and right breast tenderness. There was no nipple discharge, no axillary nodes of skin changes were noted. There was no family history of breast cancer. A biopsy was recommended by clinic provider. The biopsy was performed on 04-MAY-2009. On 07-MAY-2009 the patient received pathology results from the breast biopsy that confirmed the lump was ductal carcinoma in situ (grade 4). The patient was scheduled to visit with specialist to explore treatment options on 12-MAY-2009. Follow-up information was received in a pathology report. The patient had 1x1 cm palpable mass. On 04-MAY-2009, a right breast core needle biopsy was performed and ductal carcinoma in situ, high grade) was diagnosed. The patient's ductal carcinoma in situ (grade 4) persisted. The reporting investigator classified the event of ductal carcinoma in situ (grade 4) as possibly related to study therapy with GARDASIL. The patient's ductal carcinoma in situ (grade 4) was considered to be an other important medical event. Additional information is expected.

Other Meds: Truvada; Loestrin; Kaletra

Lab Data: Mammography, 04/16/09, abnormality in R breast/highly suspicious for ductal carcinoma in situ; Biopsy, 05/04/09, confirmed lump as ductal carcinoma

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a licensed practical nurse for GARDASIL and MMR II, Pregnancy Registry products, concerning a female patient with no known drug allergies who on 11-FEB-2009 was vaccinated with the first dose of GARDASIL (lot# 659184/0843X), 0.5 mL, intramuscular administration. Concomitant therapy administered on 11-FEB-2009 included MMR II (lot # 662817/1366X) albumin status rHA, and Tdap (unspecified). It was reported that the patient was pregnant. LMP was in January 2009, EDD was 08-OCT-2009. No adverse effect was reported. The patient sought medical attention at the physician's office. Follow up information was received from a licensed practical nurse. She reported that the patient received the GARDASIL, MMR II and Tdap (manufacturer unknown) early in her pregnancy. The licensed practical nurse stated that this patient had her pregnancy confirmed at the health department (urine hCG test) and after a few weeks, she called to report that she had a miscarriage (specific date not provided). The licensed practical nurse reported she requested that the patient come in for follow up, but she had not seen or heard from her since the phone call. Upon internal review miscarriage was determined to be an other important medical event. No further information is available. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Dizziness, Erythema, Localised oedema, Musculoskeletal pain, Oedema peripheral, Peripheral coldness, Rash, Skin discolouration

Symptom Text: Case received from a nurse on 12-MAR-2009. A 14 year old female patient with no relevant medical history received the first dose of GARDASIL (batch number: NJ328320, lot #: 0779X) via intramuscular route in her left deltoid on 11-MAR-2009, and the first dose of MENINGITEC (batch #: not reported) via intramuscular route in her right deltoid on 11-MAR-2009 and the first dose of ENGERIX-B (batch number not reported) via intramuscular route in her right deltoid. 3 minutes later the patient experienced bilateral oedema and redness on her hands, with shoulder pain and rash on her left wrist. She had recovered on the same day from shoulder pain and rash on her wrist but on 13-MAR-2009 from bilateral oedema and redness. Steroid treatment with prednisolone was given on the same day of the vaccination without success. The patient recovered spontaneously. The reporter was not sure of which vaccine might have originated the reaction. She had no concomitant treatment. Re-challenge information expected in May 2009. Additional information received through PV form received on 16-MAR-2009: The nurse was also contacted by phone on the same day to confirm all the data. Initials of the patient were modified. Suspect vaccine previously reported as MENINGITEC was in fact MENJUGATE (batch number XA0013A) and the batch number of ENGERIX-B was SO8BB. The prednisolone was SOLU-DACORTINA 50 mg. Posture of patient was changed to drain the oedema. The patient recovered on the following day (previously reported on 13-MAR-2009). The form completed by the nurse did not mention the adverse effect reported in the initial version (shoulder pain and rash on the left wrist previously reported), however this information was confirmed through the phone call made on the same day the form was received. Case originated from medical information query (09/031). Follow-up information was received from the health authorities on 18-MAR-2009: The batch number for ENGERIX-B was SO8BB was modified into 508BB. Following GARDASIL, MENJUGATE and ENGERIX-B, the pati

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Chiropractic, Fatigue, Headache, Lymphadenopathy, Musculoskeletal stiffness, Nausea, Neck pain, Vaginal discharge, Vaginal infection, Vomiting, Vulvovaginal dryness

Symptom Text: Information has been received from a nurse practitioner concerning a 22 year old female with unspecified drug reactions/allergies and medical history who on 13-FEB-2009 was vaccinated IM with 0.5ml first dose of GARDASIL (lot number:661531/1311X) and second dose on 6-APR-2009 (Lot number 661952/1129X). Concomitant therapy included hormonal contraceptives (unspecified) and Adderall. Laboratory test were not performed. The nurse practitioner stated the patient received the second dose of the vaccine and experienced swollen glands on the left side of the neck. On 30-APR-2009, the patient went to see her primary care physician with neck pain and then a chiropractor. Subsequently on 6-MAY-2009, the patient came to see the nurse practitioner and she felt that intervention to prevent serious criteria was referring the patient to an ENT physician (Ears, nose, throat physician) to determine if a biopsy was needed. The outcome of the patient was not recovered and she sought medical attention by nurse and physician's office. Additional Information has been requested. 6/2/09 Medical records received DOS 2/13/09 to 5/27/09. FINAL DIAGNOSIS: Lymphadenopathy. Post vaccination reports feeling tired, sits with head turned to left, neck pain. Took several doses of Advil followed by nausea and vomiting. Headaches. Tenderness left lateral neck, palpable lymph node. Later several swollen glands. Chiropractic adjustments. Vaginal discharge. Vaginitis. Vaginal dryness.

Other Meds: Adderall tablets; Hormonal contraceptives. 6/2/09 Medical records received DOS 2/13/09 to 5/27/09. Imitrex, Advil, Keflex, Ortho Tri-Cyclen, Advair, Adderal

Lab Data: None. 6/2/09 Medical records received DOS 2/13/09 to 5/27/09. LABS and Diagnostics: Pending - CBC, monospot, HIV.

History: None 6/2/09 Medical records received DOS 2/13/09 to 5/27/09. Migraine, bacterial vaginosis, asthma, ADD, appendectomy.

MedDRA PT Anterograde amnesia, Loss of consciousness, Presyncope, Syncope, Tremor

Symptom Text: Information has been received from a health authority (reference # ES-AGEMED-019209344) concerning a 14 year old female who was administered on 21-APR-2009 the first dose of GARDASIL (batch number not reported) by intramuscular route (site of administration not reported). After administration of the first dose of GARDASIL, on 21-APR-2009, the patient suffered a syncope with a vasovagal reaction which the patient recovered from spontaneously. According to the patient's father, 10 minutes later, the patient presented tremors and loss of consciousness. The patient says that she dreamt of male nurses not remembering where she was or what she was doing in a health center. In the health authorities' report, only anterograde amnesia, tremor and syncope are coded. The patient recovered on that same date. No further information reported. Case reported as serious by the HA with other medically important condition as criteria. Case is closed. Other business partner numbers include E200904319.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Asthenia, Cold sweat, Immediate post-injection reaction, Loss of consciousness, Malaise, Mydriasis, No reaction on previous exposure to drug, Pain, Resuscitation

Symptom Text: Information has been received from a pediatrician concerning a 14 year old female patient who on 18-MAY-2009 was vaccinated with the third dose of GARDASIL (Batch # NJ14700). No reaction reported following the first two doses. Immediately after third dose of vaccination, the patient experienced pain. Ten minutes later, according to the reporter, the patient presented vagal malaise with sensation of weakness, cold sweat, then total loss of consciousness with bilateral mydriasis. There was no dribbling or urinary emission. Considering the seriousness of the reactions, the pediatrician gave a punch in the heart of the patient to resuscitate her. The patient had regained consciousness after a short period of time that the reporter could not quantify. Pain, malaise, weakness, cold sweat, loss of consciousness and mydriasis were considered to be other important medical events by the pediatrician. Other business partner numbers include: E2009-04247. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Balance disorder, Dysarthria, Eye pain, Fatigue, Grip strength decreased, Paraesthesia, Sensory loss

Symptom Text: Information has been received from a health authority concerning a 15 year old female who was vaccinated with the first dose of GARDASIL (i.m, batch number and site of administration not reported) primo October 2008. In October 2008 (not further specified), the patient experienced sensation loss of hands and feet. It was reported that the patient had problems to hold the cutlery properly. The symptoms lasted for 2-3 weeks. In February 2009, the patient experienced the similar symptoms (not further specified), but this time, sensation loss of feet disseminated proximally to the middle of the thighs during the following 2-3 after start of symptoms. On 08-APR-2009, the patient was seen by a physiotherapist who noticed impaired balance. During the following days, the patient experienced paraesthesia of hands, feet, nose, and of the back of the head. In addition, the patient experienced articulation problems and tiredness. On 23-APR-2009, the patient experienced pain behind left eye. Subsequently, the patient also experienced pain behind right eye. MR scan of the cerebrum on 28-APR-2009 revealed increased signal intensity in the periventricular, corpus callosum and subcorticalis. Several lesions in brainstem. MR scan of spinal column was performed on 28-APR-2009. Increased signal intensity was observed posterior medulla at Th9 and C4. Blood samples (not further specified) revealed no abnormalities. No concomitant medicine or concurrent diseases. The patient was vaccinated with the second and third dose of GARDASIL (i.m., batch number and site of administration not reported) in the second week of December 2008 and ultimo March 2009, respectively. It was reported that the patient was hospitalized (not further specified) and had not recovered. Other business partner's numbers included: E2009-04267. Additional information has been requested.

MedDRA PT Crying, Fall, Head injury, Nervousness, Pain in extremity

Symptom Text: I assessed a 12 year old female who was alert and oriented but appeared nervous, comfort measures were taken. I proceded to administer the vaccines. I asked the child if she was okay, she replied that she was alright, but her left arm was in pain. The child left the room as I began to provide vaccines for the third child in the family. She was out in the hallway near the exam room. We heard a loud thump,the father abruptly left the room and was beside his child. She was awake and cyring and responded with a nonverbal manner by nodding her head to the questions being asked of her. Dr. came and asses the child. After the assessment, Dr. recommended that the child be taken to the emergency room; for she had sustained a lump on her back of her head. 911 was called. Shortly after the call was placed the paramedic arrived and took the child.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Blood pressure decreased, Contusion, Dizziness, Fall, Head injury, Headache, Loose tooth, Mouth injury, Syncope, Toothache, Vaccination complication

Symptom Text: Information has been received from a physician concerning a 24 year old female patient who on 26-AUG-2008 was vaccinated with the first dose of GARDASIL (Lot#660557/0072X), 0.5ml. On 27-OCT-2008 the patient was vaccinated with the second dose of GARDASIL (Lot#660557/0072X), 0.5ml, and on 21-MAY-2009 the patient was vaccinated with the third dose of GARDASIL (Lot#661953/1130X), 0.5ml. MENACTRA (Lot#U2877AA) was administered during the same visit. There was no other concomitant medication. On 21-MAY-2009, 5 minutes after receiving her third dose of GARDASIL, the patient fainted and fell on the floor. She was now experiencing severe headache and she also had a "busted lip" and her upper tooth was loose. The patient was not recovered now and she had sought medical. Additional information was received from a medical assistant that the patient was admitted to a hospital on 21-May-2009. The admitting diagnoses were reported as syncope, head trauma, severe headache, reaction to vaccine, contusion to mouth, and laceration to lower lip. It was also noted that the patient's two front teeth were loose. When the patient was discharged and the patient's recovery status were both unknown. The patient was not scheduled for a follow-up visit with the physician. Additional information has been requested. 7/8/09 Received PCP & vaccine records. Patient was seated during injection of vaccines and after 5 min, fell onto the floor sustaining facial injuries. Observed in office 40 min. BP prior ro vaccines 110/80; after fall 8/40; then returned to 110/70. Stable & d/c to home w/parents. Phone contact w/parent that evening revealed patient c/o HA, toothache & dizziness. Admitted to hospital for 23 hr observation. Remained stable & d/c to home. Seen again in PCP office for cellulitis/abscess left thigh/hip. No further problems. 6/9/09 Hospital records received DOS 5/21/09. Admitting diagnosis: syncope, head trauma, headache, reaction to immunizations.

Other Meds:

Lab Data: None. 6/9/09 Hospital records received DOS 5/21/09. LABS and DIAGNOSTICS: CHEM - Sodium 143 mml/L (H) Carbon Dioxide 26 mml/L (H). CBC - Hematocrit 30.7% (L) RBC Morph 1+ Aniso. CT Brain - Normal. Pregnancy Test (-).

MedDRA PT Computerised tomogram, Fall, Head injury, No reaction on previous exposure to drug, Syncope

Symptom Text: This case was received from a physician on 26 June 2009. A 14-year-old female, with a history of shrimp allergy, received the following vaccinations on 21 May 2009: a first dose of MENACTRA (lot number U2877AA) and a third dose of GARDASIL (Merck, lot number not reported). The patient was in a seated position two minutes post-vaccination, when she experienced a syncopal episode, fell to the floor, and hit her head. She had a possible injury to her tooth, and underwent a CT of the head. The patient had not experienced any adverse reactions following her first two doses of GARDASIL. At the time of the report, outcome was unknown.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Arthralgia, Inflammation, Musculoskeletal pain

Symptom Text: Information has been received from Health Authorities in a foreign country (BX20090316, BX0900344) concerning a 19 year-old female patient who received the first, second and third dose of GARDASIL respectively in July 2008, October 2008 and January 2009. In October 2008, one to two weeks after receiving the second dose, the patient presented with progressive pain in the posterior face of the right knee. The evolution was progressive until January 2009. At that time, the patient had developed pain in both knees, in the lateral face of hips and in the right shoulder. The patient was a HLA-B27 antigen carrier. Biologically, a slight inflammatory syndrome was noticed on 8-APR-2009 with an erythrocyte sedimentation rate (ESR) at 27 and C-reactive protein at 8. It is noteworthy that her father, grand father had a medical history of spondylarthropathy non designated. Knees ultrasonography was normal. Standards X-rays showed moderate troubles of the static lumbopelvic without sacroilitis. Other investigations (cutaneous, abdominal, neurological, cardiopulmonary) were normal. There was no arguments in favor of a spondylarthropathy. Pain persisted but improved with NSAID treatment. At the time of the reporting, the patient had not yet recovered. The Health Authorities assessed the causal relationship between the reported reaction and vaccination as doubtful (C2 S1 I1) according to foreign method of assessment. Other company numbers included: E2009-04462. No further information is available.

Other Meds: Unknown

Lab Data: ultrasound, Knees-Normal; X-ray, Moderate tumbles-see narrative; diagnostic laboratory test, Other investigations-Normal see narrative; serum C-reactive protein, 08Apr09, 8; erythrocyte sedimentation rate, 08Apr09, 27

History: Leukocyte antigen B-27 positive; Immunisation

MedDRA PT Epistaxis, Fall, Haematoma, Headache, Injection site erythema, Injection site inflammation, Injection site swelling, Loss of consciousness, Pyrexia, Somnolence, Syncope

Symptom Text: Information has been received from a health professional concerning a 16 year old female with a history of WOLFF-PARKINSON-WHITE syndrome who was administered on 11-MAY-2009 the first dose of GARDASIL (batch number NJ00020) by intramuscular route on the deltoid muscle. It was reported that on 16-MAY-2009, the patient suffered a syncope while she was in the bathroom, suffering a nose bleed and a face hematoma. The patient lost consciousness for about half an hour. It was also reported that she had somnolence, a headache and febricula since the fall occurred. Since Sunday (17-MAY-2009) injection site was a little swollen with some redness. The patient received ibuprofen to treat the adverse events (start and stop dates had not been reported). The events were not considered serious by the reporter. The reporter was contacted again on the 22-MAY-2009. He reported that the patient was almost completely recovered from the injection site inflammation but she continued with a headache. A CAT scan had not been realized yet. After internal review, the case was upgraded to serious. Other business partner numbers included: E2009-04284. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Arthralgia, Collagen disorder, Cushings syndrome, Joint stiffness, Polyarthritis

Symptom Text: Information has been received from a physician concerning a 27 year old female weight not reported, healthy, was administered all 3 recommended dosages of GARDASIL for cervical cancer due to HPV infection prevention, on following dates 22-JAN-2008, 22-MAR-2008 and 22-JUN-2008, respectively. On 28-JUN-2008 the patient experienced latrogenic Cushing syndrome and poly-arthralgia (generalized joints pain) post vaccination. After about one week after the last administration dose of GARDASIL, the patient presented clinical signs of poly-arthritis that required hospitalizations and deeply investigations. Hospitalization periods and performed investigations were not provided by the physician. There were several hospitalization periods in different hospitals for investigations and starting treatments. After the performed investigations in the hospital, the clinical status was considered for diagnosis of non differentiated (unspecified) collagenosis for which treatment with MEDROL, calcium, vitamin D, VIGNEFOL, SPIRONOLACTONE, PIAQUENIL was administered. The dosages and periods of administrations were not provided. The evolution was slightly favorable. In present the general status of the patient was good with remission in proportion of 98% of the clinical symptomatology. A mild stiffness at the small joints was still persisting. At the time of the report the patient had not recovered. The reporting physician considered the adverse events of latrogenic Cushing syndrome and poly-arthralgia (generalized joints pain) post vaccination to be related to GARDASIL based on the discharge diagnosis from the hospital. The prophylaxis with GARDASIL was performed with all the recommended administrations- 3 dosages. There can not be discussion about action taken for interrupting, permanently discontinuing or continuing the prophylaxis treatment. Additional information has been requested.

MedDRA PT Anorexia, Asthenia, Cell death, Choluria, Hepatitis acute, Hepatitis viral, Hypergammaglobulinaemia, Jaundice, Lymphadenopathy, Lymphocytosis, Malaise, Mucosal discolouration, Odynophagia, Pyrexia, Rash erythematous, Vasculitis, Yellow skin

Symptom Text: Information has been received on 19-MAY-2009 through a Medical Services department from a health care professional concerning a 16 year old female with no medical history or allergies who on 04-MAR-2009 was administered the second dose of GARDASIL (batch number not reported, site and route not reported). It was reported that in early April, the patient started with symptoms that were compatible with an acute hepatitis: asthenia, febricula, anorexia... It was later on confirmed through a biochemistry test performed in late April. Serologies were all negative. Bilirubin levels were high. During the patient's first episode the glutamic oxaloacetic transaminase (GOT) levels rosed up to 500. Afterwards they dropped to 200. Later on the patient had another episode where the GOT rosed to 3000. The patient was diagnosed with an acute viral hepatitis. Test results were pending. The reporter considered that due to the lack of an evident etiology for this adverse event, and taking in account that the patient was a healthy girl, vaccination could be the cause of the hepatitis. According to the reporter, it was very unlikely for this to be an autoimmune disease. An Hepatitis C Polymerase Chain Reaction and Citomegalovirus test had been ordered. Last test was performed on the 18-MAY-2009. GOT 1000, bilirubin levels were almost normal. The patient has been hospital admitted (date not reported). It is informed that the patient will be discharged from hospital next week (exact date not specified). On 18-MAY-2009 the patient was asymptomatic. On the 22-MAY-2009 the hospital report was received from the health care professional: Reason of admittance: Jaundice. Medical history: No previous relevant pathological medical records. No known allergies. The patient's sister had an infectious mononucleosis 4 months ago with an acute hepatitis. The patient was not taking any medication and did not have toxic habits. The patient was currently being administered the GARDASIL vaccines, first dose was administered on the 02-JAN-2009 and the sec

MedDRA PT Multiple sclerosis

Symptom Text: Information has been received from a registered nurse who heard from another contact concerning a 22 year old female patient who was vaccinated with a dose of GARDASIL. After receiving vaccine, the patient experienced multiple sclerosis. The nurse stated that this was not one of their patients. At the time of reporting, the outcome was unknown. The patient sought unspecified medical attention. Attempts to verify the existence of an identifiable patient has been unsuccessful. Upon internal review, multiple sclerosis was determined to be an other important medical event. No further information is available.

MedDRA PT Brachial plexopathy, Mobility decreased, Muscular weakness, Nerve conduction studies, No reaction on previous exposure to drug, Pain in extremity, Paresis

Symptom Text: Information has been received from a 23 year old female pharmacist with history of frequently upper respiratory tract infections that she was vaccinated with a second dose of GARDASIL (Lot # and injection route not reported) into the left upper arm on 15-DEC-2008. On an unspecified date in January 2009, the patient experienced severe pain in the right arm, with weakness and decreased mobility. In May 2009, a neurologist diagnosed a right arm plexus paresis. A nerve conduction velocity had been carried out (not otherwise specified). Treatment with vitamin B and physiotherapy was recommended by the neurologist. At the time of reporting, the patient had not yet recovered. Concomitant therapy included hormonal contraceptives (unspecified). A third dose of GARDASIL was administered into the left upper arm in April 2009. It was well tolerated. The first dose of GARDASIL administered on 13-OCT-2008 into the left upper arm was well tolerated. Brachial plexus lesion was considered to be an other important medical event. Other business partner numbers include E200904450.

MedDRA PT Immediate post-injection reaction, Loss of consciousness, Tonic clonic movements

Symptom Text: Initial information was received on the 25-May-2009 by the foreign Health Authority (reference number ES-AGEMED-813211338). Information has been received from a physician concerning a 13 year old female patient (weighing 54 kilograms) with a history of dermatitis atopic who on 12-MAY-2009 was vaccinated with the first dose of GARDASIL vaccine by intramuscular route (site of administration not reported). There was no concomitant medication. Immediately after vaccine administration, the patient presented with an episode of tonic clonic movements and loss of consciousness for 3 to 4 seconds. The episode was self-limiting and the patient recovered spontaneously within a few minutes, no medication was used to treat adverse events. There were no personal nor family records of convulsive disorders. On the 01-MAY-2009 the patient took HIBITANE on her own. It hasn't been reported whether the patient presented any adverse event after this administration or not. It's reported that the physician that reported this adverse event had come across similar experiences after the administration of other vaccine. The reporter believed that these adverse events were related to the route of administration (intramuscular) rather than with the vaccine itself. Reported as serious by the HA with other medically important condition as criteria. Other business partner numbers include: E2009-04460. Case is closed.

MedDRA PT Abdominal pain, Asthenia, Blood pressure abnormal, Brachial plexopathy, Chest pain, Diarrhoea, Dizziness, Eructation, Fatigue, Gastrooesophageal reflux disease, General physical health deterioration, Headache, Lethargy, Long thoracic nerve palsy, Migraine, Muscular weakness, Musculoskeletal pain, Nausea, Neuralgic amyotrophy, Pain in extremity, Palpitations, Paraesthesia, Presyncope, Sensation of heaviness, Soft tissue neoplasm, Thyroiditis acute, Toothache

Symptom Text: The date above is simply the most recent event, one of many throughout the past 9 months. This date reflects the diagnosis given by a neurologist of Parsonage Turner syndrome, a rare neurological syndrome which impairs her left arm and shoulder which she first noticed with chest, arm and shoulder pain in March. It has left her left arm and shoulder weak. Her left scapula is markedly bigger and different than her right. My daughter received her first GARDASIL shot in August, right before she left for college. Within two weeks she began having loose bowel movements, fatigue, and complaining of her "legs feeling heavy". She is a runner and was in excellent physical condition. By early October, she had her thyroid levels tested. Normal levels are between 0.5 and 4.5. Her level was 24 leaving extremely fatigued. By the time I got her home and seen by her own physician the levels had dropped dramatically and seemed to have remain now in the normal level. This "acute thyroiditis" is caused by a "virus". Shortly thereafter, she began have dizzy spells, nausea, near fainting spells, often but not exclusively concurring in the middle of the night while lying down heart racing and dysregulation of blood pressure. Along with nausea she had and continues to have burbing/acid reflux symptoms. She was hospitalized by a cardiologist and they found nothing wrong with her heart. They did try her on a bp regulation medication-FLORINET-which seem to make things worse not better. She was referred to and electro physiologist, who met with her but only recommended that she continue to monitor her bp. She had tingling in her face and arms, toothache, nausea - which she has-, migraine like headaches, and then most recently the diagnosis of Parsonage Turner syndrome. Most of these symptoms came and went...the dizzy spells lasted for about 3 months, the headaches have not occurred since April. The Nausea continues as does the tingling in her left hand and left arm weakness. Her stamina is not what it used to be. She tires easily. 7/27/0

Other Meds: not known. 8/4/09 PCP medical records received DOS 8/20/08 to 10/25/08. Etodolac, multivitamin with iron. Fish oil. Synthroid.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abasia, Abdominal pain, Abdominal pain upper, Asthenia, Chest pain, Cold sweat, Depressed mood, Dizziness, Fatigue, Feeling hot, Hypersensitivity, Immediate post-injection reaction, Limb discomfort, Lymphadenopathy, Malaise, Muscular weakness, Myalgia, Nausea, Pain in extremity, Pyrexia, Vomiting

Symptom Text: I took my daughter to a physician she had never been to before. While we were there the nurse suggested my daughter get the GARDASIL injection. I asked her 2 X's what are the side effects of this injection and she said only a slight chance of redness and swelling at the injection site. The Dr came in and AGA IN I asked her about ANY side effect of the GARDASIL, shot and she assured me that there was SIDE EFFECT. I said yes IF you ARE SURE there is NO CHANCE of any side effects.. 3 times I asked her BEFORE the injection. As soon as my daughter got the shot within SECONDS she felt sick. She became hot and clammy. At the check out desk at the Dr's, she felt very weak and dizzy..I asked the receptionists to call back and tell the Dr how my daughter was feeling, the Dr said it would pass. Within 10 minutes after the shot my daughter had extremely bad leg pain on the right side and could not walk. When we got home she felt very SAD and tired. During the night my daughter started throwing up. I called the ER and they said that that was not a normal reaction to an injection. That was Monday night, today is Wednesday and she still is having A LOT of symptoms and problems including muscle weakness, feeling sick, nauseous, chest pain, swollen glands, stomach pain. She went for blood work today and tomorrow a visit to the Dr who gave her the shot. This is CRAZY, she is suffering for what reason???? Because a Dr gave an injection WITHOUT either knowing- ignorantly-what can happen as a side effect on just not TELLING us. THIS MEDICATION SHOULD BE REMOVED..I my daughter should continue to suffer ANYTHING from this injection the makers will be SUED by US. 6/9/09 Medical records received DOS 5/18/09 to 5/20/09. MedDRA PT Adverse drug reaction, Anal pruritus, Arthralgia, Chemotherapy multiple agents systemic, Decreased appetite, Diarrhoea, Fatigue, Hodgkins disease, Hypoaesthesia, Inappropriate schedule of drug administration, Lymphadenopathy, Muscular weakness, Musculoskeletal discomfort, Night sweats, Pyrexia, Rectal fissure

Symptom Text: Close to 9 months after being given the GARDASIL vaccine. I had a ct scan done, which showed that my lymph nodes were enlarged. A little over a year later. I was diagnosed with Hodgkin's Lymphoma -HL-. I am now undergoing chemotherapy treatment for this illness. This vaccine needs to be researched properly. I am convinced there is an increased risk for Lymphoma in women who were vaccinated. How many people have to die or get seriously sick for this vaccine to be investigated? I known of several women who became sick with Lymphoma months following vaccination with GARDASIL. I do not believe this is a mere coincidence. Statistical data would prove a connection, I'm certain. No oncologist or other doctor has ever asked me whether I was vaccinated with GARDASIL. 6/15/09 Oncology records received DOS 12/23/08 to 5/5/09. FINAL DIAGNOSIS: Hodgkin's Disease Lymphocytic Depletion, Unspec Site. Presented with complaints of fever and swollen cervical lymph nodes. Fatigue, pain/discomfort right neck. Night sweats. Decreased appetite. Muscle weakness and soreness in joints. Numbness right hand. Peri-anal itching, diarrhea, rectal fissure pain. Undergoing six cycles of chemotherapy. Has chemotherapy related side effects. ICD-9 Code: 201.70 6/19/09 PMH records received. PMH: Appy, ankle fx, ovarian cyst, blocked duct, UTI. 6/24/09 Medical, vaccine records received. DOS 4/23/07 to 5/17/07. Medical records consist of laboratory studies only.

Other Meds:

Lab Data: 6/15/09 Oncology records received DOS 12/23/08 to 5/5/09. LABS and DIAGNOSTICS: CT Scan - paratracheal, pretracheal and prevascular lymph nodes. Nodules in lungs. MRI Brain - WNL. PET - involvement in mediastinal, pretacheal, and cervical

MedDRA PT Fibrin D dimer increased, Pulmonary embolism

Symptom Text: Information has been received from a physician concerning a 25 year old female with oral contraception who on 27-MAR-2009 was vaccinated with GARDASIL. Concomitant therapy included JASMINE for 4 months. On 30-APR-2009 the patient experienced pulmoner emboli and was hospitalized. On the angiography, there was pulmoner emboli in dextra inferior lob; invasive lesions in sinistra. D-dimer value was 1800 microgram/ml. Subsequently, on 6th May 2009 the patient recovered from pulmoner emboli. On 16th of May 2009 the patient was discharged from hospital. The reporter felt that pulmoner emboli was not related to therapy with GARDASIL. Therapy with human papillomavirus was discontinued. Pulmoner emboli was considered to be immediately life-threatening. Additional information is not expected.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Convulsion, Immediate post-injection reaction, No reaction on previous exposure to drug, Syncope

Symptom Text: Information has been received from a medical assistant concerning a 17 year old female with a history of convulsions and under the care of an unspecified neurologist who was vaccinated with the first (lot # 0947X), the second (lot # 1423X) and the third (lot # 0294Y) dose of GARDASIL (IM, 0.5ml) on 28-NOV-2008, 28-JAN-2009 and 28-MAY-2009 respectively. Concomitant therapy included Yaz. On 28-MAY-2009 the patient "fainted and then went into convulsions" immediately after receiving her third dose of GARDASIL. The patient roused after 60 seconds and was fully recovered within 1 hour. The patient did not have lab diagnostics studies performed. The patient did not experience adverse symptoms after the first and second dose of GARDASIL. Follow-up information has been received from a medical assistant who stated that the patient did not receive any concomitant vaccines when she received the GARDASIL. The reporter stated that the patient was on the exam table when she fainted and went into convulsions. The nurse was able to lay the patient down on the exam table. The reporter stated that the patient's neurologist was not documented in the patient's chart. Upon internal review, convulsions was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Blindness, Dizziness, Educational problem, Electroencephalogram, Gingival swelling, Headache, Nasopharyngitis

Symptom Text: Information has been received from a Health Authority (HA reference number ES-AGEMED-221086341) concerning a 14 year old female with no pertinent medical history reported who on 13-NOV-2008 was vaccinated with a dose of GARDASIL (batch number not reported) by intramuscular route (site of administration not reported). The day after vaccine administration on 14-NOV-2008, the patient experienced started with frequent cephaleas and dizziness which lasted for hours, the patient presented with loss of vision in the right eye which she recovered in a half an hour. Also it was mentioned that the patient was having a lot of colds this winter and her gums were swollen (coded by the Health Authority as gingivitis). This had happened three times this year. The patient was getting catastrophic school grades. All of this started the day after vaccine administration. The patient brought several emergency rooms reports from health care centers and hospitals. An EEG was performed and the patient was sent home. At the time of reporting the patient had not recovered. The case was reported as serious by the Health Authority with other important medical conditions as criteria. Other business partner numbers included: E2009-04580. Additional information has been requested.

MedDRA PT Erythema, Henoch-Schonlein purpura, Myalgia, Petechiae

Symptom Text: Information has been received from a gynaecologist concerning a 13 year old female who was vaccinated with a first dose of GARDASIL (lot number not reported) intramuscularly in the left upper arm on 16-APR-2009. About four days post vaccination, on approximately 20-APR-2009, the patient developed muscle pain, redness and petechiae of both lower legs. After consultation of several physicians Schoenlein-Henoch purpura was diagnosed. The patient was not hospitalized and was treated with corticoid-containing ointments (not otherwise specified). She recovered completely within an unspecified time. Follow up information was received on 02-JUN-2009. The patient was vaccinated with dose one of GARDASIL (lot number 1049U, batch number NG46500) on 16-APR-2009. The same day, she developed muscle pain (not four days post vaccination, as reported initially). On 20-APR-2009, purpura emerged and the patient was diagnosed as Schoenlein-Henoch. Routine laboratory values (including CRP) were within the normal range. No information was given regarding the patient's previous history (e.g. infections). The symptoms disappeared completely within 14 days. Upon internal review Schoenlein-Henoch purpura and muscle pain were considered to be other important medical events. Other business partner numbers included: E2009-04481. Additional information has been requested.

MedDRA PT Areflexia, Arthralgia, Asthenia, Blood product transfusion, Chronic inflammatory demyelinating polyradiculoneuropathy, Demyelination, Dysstasia, Fatigue, Influenza, Joint range of motion decreased, Muscular weakness, Pain in extremity

Symptom Text: Information has been received from a physician concerning a 15 year old female patient who on 14-NOV-2006, 16-JAN-2007 and on 12-JUN-2007 was vaccinated with the first, second and third doses of GARDASIL (Lot # not reported). It was reported that in "March 2009" the patient experienced weakness, pain in her legs and hips and the patient sought medical attention with the physician, then she was admitted to the hospital for three days on 07-APR-2009. It was reported that the patient was diagnosed with "acute demyelinating disease". The physician noted that the patient received gamma globulin for three days. It was reported that the patient was recovering but not fully recovered. The reporting physician considered "acute demyelinating disease" to be disabling. The Health Care Professional contacted during telephone follow up could not supply the following information: patient name and Lot numbers. Additional information has been requested. The patient was hospitalized. 8/14/2009 MR rec'd from PCP which includes Neuro consult in f/u to hospitalization with DX: CIDP/sub-acute polyradiculopathy. Pt developed fever, cough, cold sx, abdominal pain, H/A and stuffy ears 2/9/2009. Flu (+). Dx: Viral Flu. Returned 3/5/09 with c/o hip pain, numbness/weakness in both feet, muscle stiffness. Had recent knee injury. Worsening by 4/2/09 and referred to neurologist. Admitted 4/23-29 with dx CIDP. Tx IVIG. Neuro f/u 5/22/09 with almost complete resolution of sx. 9/1/09 Hospital records received DOS 4/23/09 to 4/29/09 and 5/21/09 to 6/21/09. Assessment: Chronic Inflammatory Demyelinating Polyneuropathy (possibly secondary to influenza illness) Patient presents with bilateral upper and lower extremity weakness, influenza diagnosed 2/10/09. Fatigue, bilateral hip and calf pain. Range of motion decreased in lower extremiities. Reflexes absent. Wide-based stance. IVIG. Improved.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Asthenia, Cyanosis, Flank pain, Muscular weakness, Peripheral coldness, Pulse absent, Renal atrophy, Renal hypertrophy, Thoracic outlet syndrome, Vascular insufficiency

Symptom Text: Information has been received from a medical assistant and a registered nurse concerning a 26 year old female with no pertinent medical history reported and no known drug allergies who on 16-APR-2008 and 16-OCT-2008, was vaccinated intramuscularly with first 0.5mL dose (Lot number 659329/1468U, valid for Varicella virus vaccine live (MSD) and second 0.5mL dose (Lot number 660620/0571X), respectively of GARDASIL. There was no concomitant medication. The medical assistant reported that on 16-APR-2008, the patient developed thoracic outlet syndrome. It was reported that the patient had no strength on her left arm and right arm. She had decreased "vascular" in her left arm with elevation. The registered nurse reported that the patient came to the office. She reported that her arms felt like blood was draining out of them when she raised them and got blue and cold. The left arm had no strength and the right arm had little strength. The condition had not improve since the second dose of GARDASIL. The vaccine was given to the patient consecutively in alternating arms. The registered nurse reported that the physician was looking into other causes like conditions relating to her chest region because he did not believe that this event was related to GARDASIL. As of 04-JUN-2009, the patient had not recovered from the event. The patient sought unspecified medical attention. Follow up information was received from a registered nurse which revealed that no other vaccines were administered at the time of the three GARDASIL doses. No labs/diagnostic tests were ordered for Thoracic Outlet Syndrome. No consults were requested. It was reported that the physician told the patient to be caution when lifting or doing heavy work. The registered nurse also reported that on 04-JUN-2009, when the patient was seen for a pap smear (results not provided), she complained of right flank pain. An ultrasound of the abdomen and pelvis, performed on 08-JUN-2009, showed severe atrophy of the left kidney with compensatory hypertrophy of the right ki

Symptom Text: Gardasil #1 (1423X) given in right arm on 4/23/09. Adverse reactions symptoms began 4/24/09 exhibited by: dizziness, headache, stomach pain, nausea, chest pains, shortness of breath, pins/needle sensations to feet, burning of skin, nerve pain to right elbow, fatigue, muscle weakness to legs, nausea, swollen lymph nodes to neck. Physician contacted 4/28/09 because this was felt to be in direct relation to the vaccine. She felt it was viral. 6/03/09 Same physician seen due to symptoms becoming more severe. Lab work drawn to rule out Mono due to swollen lymph nodes. 6/08/09 Pediatric Neurologist seen who confirmed that the symptoms were directly related to the Gardasil injection. Diagnosed peripheral neuropathy. 6/17/09 Medical and immunization records received DOS 4/23/09 to 6/3/09. Assessment: Pain & tingling, fatigue, lymphadenopathy. Patient presented with fatigue, headache, dizzy, chest pain, tingly feeling in arms and legs, pale, tender cervical lymph nodes. Referral to neurologist. LABS and DIAGNOSTICS: Planned CBC, ESR, CRP, Electrolytes, EBV, IgG, IgM 8/3/09 Consultant medical records received DOS 12/12/08 to 6/29/09. Assessment: New onset symptoms after Gardasil. Patient presents with dizziness and waves of nausea. Chest pain, shortness of breath, and intermittent bifrontal headaches. Tingling of feet and hands with associated pain. Burning sensation in hands and quadraceps muscles. Off balance. Back pain. EB Virus pending. Neuropathic type pain - ulnar region. Allodynic pain. Tender in C2 to C6. Heart rate 74 and standing heart rate 100. Flat affect and dysphoric mood.

Other Meds: Lexapro

Lab Data: CBC with diff/ plt, C-reactive protein, SED rate, electrolyte panel, Epstein Barr AB panel 6/17/09 Medical and immunization records received DOS 4/23/09 to 6/3/09. LABS and DIAGNOSTICS: Planned CBC, ESR, CRP, Electrolytes, EBV, IgG, IgM.

History: OCD. 6/17/09 Medical and immunization records received DOS 4/23/09 to 6/3/09. OCD, depression, anxiety, suicide attempts. Kidney stones. Weakness, dizziness. Allergy - Lamictal. 8/3/09 Consultant medical records received DOS 12/12/08 to 6/29/09. Tremor with intention, obsessive-compulsive dysfunction, mood disturbance. Allergy to Lacmictal. Kidney stone. MedDRA PT Abdominal pain, Back pain, Chest pain, Dizziness, Fatigue, Headache, Hypoaesthesia, Muscle spasms, Muscular weakness, Nausea, Neuralgia, Neuropathy peripheral, Paraesthesia, Presyncope, Thirst, Visual impairment

Symptom Text: She received the first GARDASIL injection on 4/23/2009. Symptoms began developing on 4/24/2009. Initially, she was only dizzy and nauseous. As time progressed she has become sicker. She began having headaches, back pain, chest pain, abdominal pain, muscle weakness, numbness and tingling to feet, nerve pain, near fainting, visual disturbances, back pain, muscle cramps, constant thirst, chronic fatigue. She has been diagnosed with peripheral neuropathy. There are over 15,000 VAERS reports regarding this vaccine and that is only current since April 30. And that number is not accurate. There are many, many more that have not made the connection of their illness being caused by the GARDASIL. How many girls need to be injured and killed by this vaccine before the FDA pulls it from the market? This is the organization that we depend upon to protect us - you have completely failed my once healthy daughter! She is now "one less" healthy teenager!

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a health care professional concerning a 16 year old female who on 19-DEC-2008 was vaccinated with the first dose of GARDASIL. On 13-FEB-2009, the patient was vaccinated with the second dose of GARDASIL. Concomitant therapy included MICROGYNON 30. The patient was pregnant at time of the GARDASIL injection (gestation week unknown at time of reporting): date of last menstruational period was in January 2009. Pregnancy testing has been performed by reporter on 13-FEB-2009. Pregnancy testing has been performed by reporter on 13-FEB-2009. No adverse event reported. Follow-up information from a health care professional indicated that the patient (reference: TMI-2009-95) received the first dose of GARDASIL on 19-NOV-2008, not on 19-DEC-2008 as was previously reported. The second dose of GARDASIL was from lot #1202U, batch #NJ31210. Concomitant treatment included MICROGYNON 30 since August 2008. At the administration of the second dose of GARDASIL, gestation period was estimated at +/- 7 weeks. The date of birth was foreseen in October 2009. Follow up information received from a health care professional on 11-MAR-2009: Voluntary termination of pregnancy on 03-MAR-2009. Upon internal review, voluntary termination of pregnancy was determined to be an other medical event. Additional information has been requested. Other business partner numbers include E2009-01434.

MedDRA PT Abnormal behaviour, Arthralgia, Asthenia, Muscular weakness, Myalgia, Pain, Vomiting

Symptom Text: Information has been received from a physician concerning a 12 year old female patient with no relevant medical history reported, who received the first dose of GARDASIL (lot number 0779X, batch number NJ32820) via intramuscular route on 31-MAR-2009. Eight days after vaccination, on 08-APR-2009, the patient experienced vomiting. On 27-APR-2009, i.e. 27 days after vaccination, she also developed myalgia, arthralgia and lower member myasthenia. She was also found to have bilateral pain. She had been given anti-emetic therapy with PRIMPERAN and metoclopramide but with no effect. The only medication the patient was taking at the moment was omeprazole. She was on a liquid diet, because of her symptoms. Furthermore, at the end of each day, she presented with a loss of strength. She was not attending classes because of her symptoms. On 16-MAY-2009, she presented with behaviour changes which resolved on 17-MAY-2009. Abdominal and muscular ultrasounds, blood analysis and medical examination were performed. The reporter considered that everything was normal except a possible conversion disorder diagnosis written in the emergency room report, but the reporter disagreed with this possible diagnosis. To be noted that a slight creatinine decreased (0.4 for a minimum 0.5 threshold) in a blood exam on 09-MAY-2009, was not highlighted by the reporter, considering that all the other results were normal. It was noteworthy that the events were reported as serious due to the duration of the events, except for behaviour changes which were reported as non serious as it was a "one-time situation". At the time of reporting, the patient was still vomiting and had not yet recovered from the other events either. The reporter considered myalgia, arthralgia, pain, myasthenia and strength to be other important medical events. Other business partner numbers included: E2009-04670. Additional information has been requested.

Other Meds: metoclopramide

MedDRA PT Dizziness, Nausea, Vomiting

Symptom Text: Initial information has been received from a health authority (HA ref. DK-DKMA-20091250). It was reported that a 16 year old female patient who on 12-MAR-2009 was vaccinated with the first dose of GARDASIL IM left arm (batch # NJ50800, lot # 0773X). On the same day the patient experienced dizziness, nausea and vomiting a few times. Dizziness was initially interpreted as vestibularisneuritis by an ear-nose-throat specialist (date not reported). MR-scan was ordered (result not reported). At the time of report the patient had not recovered. Other business partner numbers include: E2009-04644. Additional information has been requested.

MedDRA PT Acute tonsillitis, Familial risk factor, General physical health deterioration, Ketoacidosis, Polydipsia, Polyuria, Rash pruritic, Somnolence, Type 1 diabetes mellitus, Urticaria, Weight decreased

Symptom Text: Information has been received from a gynecologist that a 14 year old female patient who was vaccinated IM with a first dose of GARDASIL (lot number and injection site not reported) on 06-FEB-2008. On unspecified date ("in a temporal relationship to GARDASIL vaccination"), the patient developed diabetes mellitus type I. The patient had not recovered at the time of reporting. Upon internal review on 04-JUN-2009, the case was considered medically significant. Type I diabetes mellitus was considered to be disabling by the gynecologist. Other business partner numbers included (E2009-04463). No further information is available. Follow up has been received on 16-JUN-2009. The hospital report was provided. The patient was hospitalized from 26-AUG-2008 until 12-SEP-2008. Hospital diagnosis: "Manifestation of diabetes mellitus type I with ketoacidosis and precoma diabeticum". Since a "few weeks before hospitalization" the patient experienced polydipsia and polyuria and lost 7 kg of weight. Since about 2 weeks before hospitalization her general condition began to reduce. Since one week she suffered from angina tonsillaris which was treated with antibiotics. Symptoms worsened remarkably and she was hospitalized on 26-AUG-2008. At the time the patient was slightly drowsy (Glasgow coma scale 14) showed Kussmaul respiration and signs of exsiccosis Hyperglycemia (27 mmol/L) had been determined by the physician on emergency. Therapy was started with rehydratation and insulin intravenous. Intensive insulin therapy (LANTUS and NOVORAPID) was started from the third day of hospitalization. In the course of the quantity of insulin could be measurably reduced. In the meantime the patient developed a pruritic, partly urticarial rash which was successfully treated with FENYSTIL. Lab findings see lab comments: Gliadin-IgA and Gliadin-IgG, tTG(endomysium) Ig A were normal. The patient had a family Medical history of Diabetes mellitus type 2 (maternal grand father). The patient was discharged in a good general condition. Duration and outc

MedDRA PT Amnesia, Blood test, Dizziness, Epilepsy, Nausea, Syncope, Urinary incontinence

Symptom Text: Information has been received from a physician concerning a 22 year old female who on 20-MAY-2009 was vaccinated with the first dose of GARDASIL, 0.5 mL, intramuscular. On 20-MAY-2009, few seconds after vaccination, patient complained of giddiness, felt like vomiting and fainted for few seconds. Doctor commented the patient was having epileptic experience as the patient cannot control urination and did not remember anything after regaining consciousness. Patient was put on IV drip after regaining consciousness and was sent to hospital for further checkup & blood test. Patient was not hospitalized. Patient does not suffer from hypoglycemic condition. Subsequently, the patient recovered from epilepsy and fainting episode. Causality is unknown. Upon internal review, epileptic experience was determined to be an other important medical event. No further information is available.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Fall, Head injury, Presyncope, Syncope

Symptom Text: Patient had severe vaso response and fainted at check out window approximately 8 minutes after receiving vaccine. She fell hard and hit the floor with her head. An ambulance was called due to the magnitude that she hit her head and it took her quite a long time (roughly 10 minutes) to completely come to and know her surroundings. She had a very large knot on her forehead/temple area and we felt the need for the ER to evaluate the head for any trauma associated with the fall.

MedDRA PT Arthralgia, Pain in jaw, Paraesthesia oral, Sensation of foreign body, Tremor

Symptom Text: Information has been received from a nurse concerning a 23 year old female who on 29-MAY-2009 was vaccinated with the first dose of GARDASIL, 0.5ml/IM. After about 20 minutes the patient experienced the feeling of a lump in her throat, tingling of her tongue, achy joints and body tremors. Follow up information has been received from a physician reporting that when the patient had gone to the emergency room she was given I.V. BENADRYL and Benztropine mesylate (MSD) and released. The physician stated that he received a call from the patient a few minutes ago and the patient said that she was starting to have body tremors again as well as aching of her jaw. At the report time the patient was on her way to see the physician and the outcome was unknown. Upon internal review tingling of her tongue, body tremors and lump in her throat were considered as Other Important Medical Events. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Arrested labour, Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a consumer, for the Pregnancy Registry for GARDASIL concerning herself, a 26 year old female, who on 12-FEB-2008 was vaccinated with her first dose of GARDASIL (lot# not reported). Concomitant therapy included Zoloft. On 18-FEB-2008 the patient found out she was about 6 weeks pregnant. Her LMP was estimated to be 06-JAN-2008 with a due date of 12-OCT-2008. The patient had a positive home pregnancy test. Her outcome was not reported. Follow up information was received from the consumer and the office nurse, for GARDASIL, Pregnancy Registry product. The office nurse reported that they did not even know the patient was pregnant. The patient reported that she went into spontaneous labor, but her labor didn't progress fully, and she had a cesarean section. On 22-OCT-2008, the patient delivered a health baby boy (8 pounds, 13 ounces) with no problems. At the time of reporting, the patient recovered completely from the C-section, and had no complications. Upon internal review, cesarean section due to labor not progress fully was determined to be an other important medical event. Additional information is not expected.

Other Meds: ZOLOFT

Lab Data: Beta-human chorionic, positive

MedDRA PT Antinuclear antibody, Biopsy bone marrow, Blood product transfusion, Complement factor C3, Complement factor C4, Full blood count, Idiopathic thrombocytopenic purpura, Metabolic function test

Symptom Text: Information has been received from a physician concerning a 16-year-old female patient with no medical history who was vaccinated with the second dose of GARDASIL. Concomitant therapy included Depo-Provera. A week or two after the second dose of GARDASIL the patient developed idiopathic thrombocytopenic purpura and was admitted to hospital and given intravenous immune globulin (IVIG) 2 doses. The following lab diagnostics studies was performed: Complete blood count, Comprehensive Metabolic Panel, Antinuclear Antibody Test, serum complement C3/C4 ratio, Immunoglobulin A, Bone marrow biopsy. The patient has been discharged. The patient's idiopathic thrombocytopenic purpura was considered to be disabling and an other important medical event. The patient had not been recovered. Additional information has been requested. 6/22/09-records received for DOS 5/28-5/30/09- DC DX: ITP status post 2 doses of IVIG with slight improvement of platelet count. Presented with newly diagnosed ITP with mild bruising. ICD-9 287.31.

Other Meds: DEPO-PROVERA

Lab Data: Unknown 6/22/09-records received-Two weeks prior platelet count of 26. Rheumatology labs negative.

History: None 6/22/09-records received- PMH Depo Provera.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Condition aggravated, Convulsion, Tonic clonic movements

Symptom Text: Information has been received from a physician concerning a 9 year old female with convulsion (tonic-clonic convulsions since 6 years before the report, last episode 4 years before of this report) who on 29-MAY-2009 was vaccinated with GARDASIL. Concomitant therapy included valproate magnesium. On 29-MAY-2009 the patient experienced seizure after the first dose of GARDASIL was administered. The convulsion was characterized by tonic-clonic movements with 5-10 seconds to duration, without sphincter relaxation. The patient recovered from seizure on 29-MAY-2009 without additional treatment. The reporter felt that seizure was related to therapy with GARDASIL. Upon internal review seizure was considered as other important medical event. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Amnesia, Contusion, Gaze palsy, Grand mal convulsion, Head injury, Headache, Loss of consciousness, Muscle twitching, Neck pain, Pallor

Symptom Text: April 2009: Pt. had conjunctivitis in both eyes and was tx'd with antibiotic gtts x5 days. 8 May 09: Annual physical exam was normal. Conjunctivitis had cleared. Gardasil vaccine was offered, but patient and parent refused. 26 May 09: Eye discharge (OU) in a.m., so made MD appt. 29 May 09: Went to physician to have eyes checked again for conjunctivitis return. MD noticed that Gardasil had not been given at the 8 May 09 annual physical exam. MD stated that pt. really should have the Gardasil vaccine because "it will save your life." Pt. finally consented. At 9 a.m., Gardasil was administered in the left deltoid. Pt. and mother immediately went to front desk to schedule next appt. to receive Gardasil (2nd in a series of 3 Gardasil vaccinations). At 9:10 am, at the front desk, the nurse who had given the vaccine came out to offer ibuprofen for deltoid pain. The pt. was pale and tried to hold onto the counter when she lost consciousness. She hit the back of her head on the floor and sustained a contusion. The pt's mother, the RN and the MD came to the pt's side. The pt. was unconscious for about 5 minutes. During the 5 minutes of unconsciousness, she sustained clonic/tonic seizures with her hands clutching up and down. Her eyes rolled up and to the right and she was "twitching." The RN rubbed knuckles on the pt's sternum to evaluate consciousness while an oxygen mask (100% oxygen) was applied. An EMT who happened to be in the waiting room assisted by holding the pt's head to keep it from banging against the floor repeatedly. After 5 minutes, the pt. spontaneously opened her eyes and was able to accurately say her name, the date and the location. She complained of neck and head pain. 911 was called and the pt. brought to the ER at 10:30 am. Pt. kept asking what had happened and had no recollection of any events after holding onto the reception desk in the waiting room. Neuro status was normal except for the head contusion. CV status was evaluated by ultrasound which was found to be normal (ER phy

Other Meds: last medication pt. had taken was on 24 May 09: 400 mg ibuprofen for menstrual cramps.

Lab Data: 29 May 09: cardiac ultrasound was normal. 29 May 09: CBC was normal.

History: None: Pt. has no history of seizures. She does have a history of seasonal allergies, but does not take any medication for it. Pt. had a history of allergic reaction to bee stings (swelling and pruritis at sting site) and poison oak (both successfully treated with Benedryl).

Prex Illness: conjunctivitis, otherwise the pt. was in completely normal state of good health.

Symptom Text: Approx 90 seconds after the first injection my daughter became faint and passed out, she then began having a seizure, the entire episode lasted approx 2 minutes. After being treated and stabilized at the clinic, we saw our family DR approx one hour later. she had multiple xrays due to the injuries when she fainted, she has a mild concussion with slight dialation of the left pupil. she has a lingering headache, (we are sure this is at least in part due to the facial injuries from the fall to the tile floor). There is signigiant pain at the injection site which is being treated with ice packs and extra strenght Tylenol (no motrin allowed due to the high level of bruising) after seeing our family DR she has refered us to a Neurologist to rule out any underlying factors leading to the fainting and seizures that our daughter experienced today. 7/29/09 Consultant records received DOS 6/11/09. Assessment "faint" vasovagal Patient felt dizzy, passed out, loss of consciousness, posturing, incontinence, hit (R) face, (R) hip, (R) knee, some jerking. Presents with erythema (R) cheek / skin / (R) Hip and knee. Contusion (R) hip (R) knee (R) face. Face and knee feel sore. (L) pupil > (R) properly responding. Auditory canal blocked with wax.

MedDRA PT Aborted pregnancy, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician, for GARDASIL, a Pregnancy Registry product, concerning a 15 year old female with no medical history and no drug allergies, who on 26-NOV-2007 was vaccinated intramuscularly in the left arm with a 0.5mL first dose of GARDASIL (Lot# 658563/1063U). On 28-JAN-2008 the patient was vaccinated with a second dose of GARDASIL (Lot# 658563/1063U). There was no concomitant medication. Subsequently, the patient was pregnant. The patient believed her last menstrual period to be 20-NOV-2007 and her estimated delivery date was 26-AUG-2008. The patient was seen in the office. A urine pregnancy test was taken. No symptoms were reported. At the time of the report, the outcome of the patient was unknown. No product quality complaint was involved. Follow up information was received from the physician who reported that the patient's EDD was 11-AUG-2008. On an unspecified date the patient aborted her pregnancy as it was unwanted pregnancy. Upon internal review, pregnancy aborted was considered to be an other important medical event. Additional information is not expected.

MedDRA PT Breech presentation, Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse, for GARDASIL, a Pregnancy Registry product, concerning a 17 year old female patient with no known drug allergies who on 24-APR-2008 (also reported as 28-APR-2008) was vaccinated with the first 0.5 ml IM dose of GARDASIL. On 26-JUN-2008 the patient received the second 0.5 ml IM dose of GARDASIL. On 24-OCT-2008 the patient received the third 0.5 ml IM dose of GARDASIL (lot # 659439/1267U). Concomitant therapy included insulin and SYNTHROID. At the time of the third dose the patient reported she was pregnant and LMP was 06-OCT-2008. Lab diagnostics studies included ultrasound and bloodwork. Ultrasound showed that LMP was 06-AUG-2008. Estimated delivery date was 13-MAY-2009. Bloodwork for OB profile was performed with all results in normal limits. The patient sought unspecified medical attention. Follow up information has been received from a completed questionnaire by a physician. It was reported on the questionnaire that the patient with diabetes, hypothyroidism had no complication and no infections or illnesses during pregnancy. On 24-DEC-2008, 18-FEB-2009, 01-APR-2009, 15-APR-2009 and 29-APR-2009, the patient had ultrasounds which were normal. On 30-APR-2009 at 38 weeks from LMP, the patient underwent a cesarean section due to breech and had a normal female liveborn infant. There were no congenital anomalies. She was 9 lbs 2.2 oz weight, 21 inches long, apgar score was 9/9. Upon internal review, cesarean section due to breech was considered to be an other important medical event. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy, Threatened labour

Symptom Text: Information has been received from a healthcare professional, for GARDASIL, a Pregnancy Registry product, concerning a 20-year-old female patient with medical history of genital warts who received the second dose of GARDASIL (lot# not provided, batch # not provided) on 03-NOV-2008 while she was pregnant. Her last menstrual period was on 26-OCT-2008 and pregnancy was confirmed with U/S scan. At time of reporting the patient had no adverse effect. She had no concomitant treatment. Follow-up information received from the reporting physician on 04-JUN-2009 and transmitted by the distributor: Case upgraded to serious considering the following information: the 22 year old patient (corrected 05-JUN-2009) was hospitalized on 01-JUN-2009 due to a risk of premature labour. The patient was currently in her 31st week of gestation. The patient had received the second dose of GARDASIL via intramuscular route. At the time of reporting, the outcome was not reported. Threatened premature labour was considered an other important medical event. Other business partner numbers include: E2009-01324. No further information is available.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician for the Pregnancy Registry for GARDASIL regarding an 18 year old female with depression and a history of attention deficit disorder (1988) who on 31-OCT-2007 was vaccinated intramuscularly with her first dose of GARDASIL (Lot # 657006/0188U; site not reported). On 31-DEC-2007, the patient was vaccinated intramuscularly with her second dose of GARDASIL (Lot # 658554/0928U; site not reported). On 31-MAY-2008 (also reported as 4 days ago), the patient took a home pregnancy test which was negative. On 03-JUN-2008, the patient was vaccinated intramuscularly with her third dose of GARDASIL (Lot # reported as "0178U"; site not reported). Concomitant therapy included an unspecified antidepressant. On 03-JUN-2008, the patient took four home pregnancy tests which were all positive. The LMP date was not reported. The patient sought unspecified medical attention in the office. The patient outcome was not reported. No additional information was provided. All telephone attempts to contact the physician have been unsuccessful. Follow up information was received from the licensed practical nurse concerning the 18 year old patient who experienced miscarriage in approximately June 2008 which was about 2-3 weeks after the initial report was called in June 2008. The patient was doing fine. Upon internal review, miscarriage was determined to be an other important medical event. Additional information is not expected.

MedDRA PT Abortion, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician, for the Pregnancy Registry for GARDASIL, concerning an 18 year old female who on 13-JUN-2008 was vaccinated with the first dose of GARDASIL (lot # 658222/0927U). Subsequently the patient had a positive pregnancy test. The patient's LMP was not reported. Patient outcome was not reported. The patient sought unspecified medical attention by contacting the office. Follow-up information has been received from a physician who reported that the patient had an abortion. The abortion was not due to congenital anomaly or abnormal sonogram result. Patient decided on her own that she had too many unplanned pregnancies. Upon internal review, abortion was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Pregnancy induced hypertension

Symptom Text: Information has been received from a nurse, for the pregnancy registry for GARDASIL, concerning a female with no known allergies and no pertinent medical history who in approximately July 2007, was vaccinated IM with a dose of GARDASIL (lot#, and site not reported) 0.5 ml. There was no concomitant medication. The patient sought unspecified medical attention. The nurse reported that the patient is pregnant and "she's probably in labor now" but was not positive. The LMP (last menstrual period) and estimated date of delivery were not reported. Method of pregnancy confirmation was also not reported. The nurse did not have the patient's chart in front of her, so exact details could not be provided. Follow up information was received, for GARDASIL, a Pregnancy Registry product, which reported that the patient delivered a baby via C-section on 24-MAY-2008. The reporter said that the patient had mild pregnancy-induced hypertension (PIH), but she was not sure why the C-section was performed. The baby just turned one and was normal and healthy with no congenital anomalies. The patient worked in the office and everything turned out fine. Upon internal review, C-section was determined to be an other important medical event. No further information is available.

MedDRA PT Complex partial seizures, Condition aggravated, Grand mal convulsion, Impaired driving ability, Neurological examination abnormal, Postictal state, Stereotypy, Tongue biting

Symptom Text: DURING A ROUTINE PHYSICAL, I WAS GIVEN A TETANUS AND GARDASIL VACCINE SHOT. APPROXIMATELY FIFTEEN AND A HALF HOURS AFTER THE FIRST INOCULATION OF THE VACCINE GARDASIL, I EXPERIENCED TWO ONSET GRAN MAL SEIZURES. SEIZURES OCCURED IN THE MORNING, WITHIN FOUR AND A HALF HOURS OF EACH OTHER. I WAS TRANSPORTED BY AMBULANCE AFTER BOTH EPISODES. AFTER FIRST SEIZURE, I WAS GIVEN A CT SCAN AND BLOOD WORK-UP. BOTH TESTS CAME BACK NEGATIVE. NO PRESCRIPTIONS WERE GIVEN. I WAS RELEASED FROM THE ER WITH INSTRUCTIONS TO FOLLOW UP WITH A NEUROLOGIST ASAP. AN HOUR AFTER RETURNING HOME, I EXPERIENCED A SECOND, GRAN MAL SEIZURE AND WAS TAKEN BY AMBULANCE BACK TO THE ER. I WAS GIVEN INTRAVENOUS DILANTIN, AND ADMITTED TO THE HOSPITAL WHERE I STAYED THURSDAY INTO FRIDAY. I WAS GIVEN MORE BLOOD WORK-UP, AN MRI, AND AN EEG. RESULTS ARE PENDING FOLLOW-UP VISITATION WITH THE NEUROLOGIST. IN THE HOSPITAL, I RECEIVED 300MG OF DILANTIN (PILL FORM), DAILY. ACCORDING TO THE TECHNICIAN AND NURSE, I WAS RELEASED FROM THE HOSPITAL BECAUSE THEIR INITIAL SCREENING OF MRI AND EEG DID NOT SHOW TUMOR, CLOTTING, OR BLEEDING IN THE BRAIN. THE NEUROLOGIST HAS PRESCRIBED 300MG OF DILANTIN (PILL FORM) TO BE TAKEN DAILY. I AM NOW RESTRICTED FROM DRIVING FOR A MINIMUM OF THREE MONTHS, PENDING MY RESPONSE TO MEDICATION. ALTHOUGH THE NEUROLOGIST HAS NOT SEEN THE MRI OR EEG RESULTS, I HAVE BEEN DIAGNOSED WITH HAVING COMPLEX-PARTIAL SEIZURE DISORDER. THE NEUROLOGIST IS RELUCTANT TO AFFIRM OR DENY GARDASIL AS A CATALYST TO GRAN MAL EVENTS. 6/16/09 Received hospital medical records for 6/11-6/12/2009. FINAL DX: partial complex seizures Records reveal patient experienced 2 tonoclonic seizures w/tongue biting on 6/10 lasting approx 3 min w/postictal period after. Seen in outlying ER where w/u WNL & d/c to home. Returned to ER after 2nd seizure, loaded w/antiseizure meds & transferred to higher level of care. Neuro consult done & revealed pt had stereotype espisodes x 3 years. Tx w/antiseizure meds. 8/3/09 Received ICD9 codes: 780.39.

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 11 year old female patient with no pertinent medical history who on 13-MAY-2009 was vaccinated intramuscularly into the right arm with the third dose of GARDASIL (Lot # 659054/0315Y). On 27-MAY-2009, the patient experienced congestion; on 02-JUN-2009 patient had fever and leg pain; on 06-JUN-2009 the patient experienced headache and vomiting and on 10-JUN-2009, the patient experienced broad-based gait, facial weakness? and asymmetry. On an unspecified date, there were several exams performed; cerebrospinal fluid total protein was elevated, head computed axial tomography and magnetic resonance imaging were normal. The patient required an emergency room visit. The listing indicated that one or more of the events required hospitalization. The original reporting source was not provided. The VAERS ID # is 349128-1. Additional information has been received from a registered nurse concerning an 11 year old female patient who on 13-MAY-2009 at 4:00 pm was vaccinated with the third dose of GARDASIL. No other concomitant medications. On 27-MAY-2009 (previously reported as 31-MAY-2009) at 12:30 the patient went to the physician's office with a "virus" the she went into a sinus infection and then got a stomach virus all back to back over 2 weeks. Then she presented neurological dysfunctions in her facial muscles, speech, mouth motor skills, severe changes in her walking gait, extreme fatigue and dehydration. The patient was taken to the emergency room, and within 36 hours she was discharged with MILLER-FISHER syndrome. She went to the intensive care unit for several days and stayed in the hospital for two weeks. As of 15-JUN-2009, the patient was still recovering after intravenous immunoglobulin and involved in physical, occupational and speech therapies multiple times per week and was still on liquid thickeners. A standard lot check investigation has been finalized. All in-process quality ch

MedDRA PT Anaphylactic reaction, Tremor, Vomiting

Symptom Text: Information has been received from a nurse concerning a female with no allergies who on 20-JUL-2007 and on 24-SEP-2007 was vaccinated IM 0.5 mL with the first and second doses of GARDASIL (lot# Not reported) respectively. It was unspecified if the patient had any adverse events after the first or second doses. On an unknown date, the patient received the third dose of GARDASIL (lot# not reported) IM 0.5mL. After the third shot, on 25-JAN-2008, the patient started "shaking" and vomiting. The patient went to the Emergency Room of a hospital and had "an anaphylactic reaction" while there. The patient was not admitted to that hospital but was "transferred" and admitted to another hospital for the "anaphylactic reaction". Subsequently, the patient recovered from the anaphylactic reaction while she was in hospital. In follow-up, it was reported the events happened in 2008 and patient's name and details could not be recalled. This is one of several reports from the same source. No further information is available.

MedDRA PT Guillain-Barre syndrome

Symptom Text: Information has been received from a nurse practitioner concerning 3 children who was vaccinated with GARDASIL. The nurse practitioner reported that a mother of her patient informed her that 3 children in her patient's high school developed guillain-barre syndrome after receiving GARDASIL. The patient refused and did not get the GARDASIL for this reason. Upon internal review, Guillain-Barre syndrome was considered to be an Other Important Medical Event. Attempts are being made to verify the existence of an identifiable patient and reporter. Attempts are being made to obtain additional identifying information to distinguish the individual patients mentioned in this report. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received for the Merck pregnancy registry, from a nurse concerning a female patient, who was vaccinated with two doses of GARDASIL on 28-Sep-2006 and 27-Nov-2006 respectively. The patient is currently pregnant and her LMP was 15-Dec-2006. The patient's outcome was unknown. Follow-up information was received via the registered nurse from pregnancy questionnaire. The 17 year old patient with a history of 1 previous pregnancies and 1 full and a history of gestational diabetes mellitus was vaccinated with three doses of GARDASIL on 28-sep-2005 (lot # 653735/0688F), 27-Nov-2006 (lot # 653978/0955F) and 05-Oct-2007 (lot # 658282/0929U) respectively. Other medication use during pregnancy included prenatal VITAMIN. On 04-APR-2007, serum alpha-fetoprotein test was performed with negative delivered a male normal baby weighting 7 pounds 5.5 ounces with apgar score 9/9 at 36 weeks. The length of the baby is 19 inches. There were no congenital anomalies, other complication or abnormalities. There was no complication during pregnancy and labor/delivery. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received from a registered nurse, for the pregnancy registry for GARDASIL concerning a 21 year old female with a history of laparoscopic cholecystectomy (27-JUL-2007) and cesarean section who on 16-JAN-2008 was vaccinated intramuscularly in the right deltoid with a dose of GARDASIL (lot#659439/1267U). There was no concomitant medication. The patient sought unspecified medical attention during an office visit on 16-JAN-2008 and 04-FEB-2008. The nurse reported that the patient was pregnant. Last menstrual period was 23-DEC-2007 and estimated date of delivery is 28-SEP-2008. The patient had a negative urine pregnancy test on 16-JAN-2008 and a positive pregnancy test on 04-FEB-2008. No symptoms have been reported. Follow up information received on 04-MAY-2009 from the registered nurse stated that the patient transferred her prenatal care to another physician. The reporter said that she does know that the patient did deliver her baby and had no complications. Follow information received from a physician indicated that the patient gave birth to a normal live born female, who weighted 6 lbs and 6 ounces on 13-SEP-2008 at 37 weeks and 3 days from LMP. The baby's length was 19" and her apgar score was 9/9. There were no congenital abnormalities. It was also reported that the baby experienced decreased fetal movements and decreased heart beat to beat variability. There were no complications during pregnancy and during labor. The patient had routine prenatal blood work within normal limits. No further information is available.

MedDRA PT Drug exposure during pregnancy, Premature labour

Symptom Text: Information has been received from a physician for the Pregnancy Registry for GARDASIL, concerning a 17 year old female with no known allergies and a history of depression, iron deficiency anemia and gastroesophageal reflux who on 27-DEC-2007 was vaccinated intramuscularly with a 0.5 mL first dose of GARDASIL (lot # 659435/1265U). On 25-FEB-2008 the patient was vaccinated intramuscularly in the "right upper arm" with a 0.5 mL second dose of GARDASIL (lot # 659962/1740U). The physician reported that on an unspecified date the patient called her OB/GYN and reported that she was approximately 8 weeks gestation. Actual LMP and method of pregnancy confirmed were not reported. In follow-up it was reported that concomitant medication included BENTYL, 10 mg as needed for the treatment of GERD; ORTHO TRI-CYCLEN, 0.025 mg daily for "prevention"; and ZOLOFT, 25 mg daily for the treatment of "Post Partum". It was also reported that the patient's estimated delivery date is 20-NOV-2008 (estimated LMP 12-FEB-2008). Follow-up information has been received that the patient made a preterm delivery on an unknown date, the infant was normal. No further information is available.

MedDRA PT Chlamydial infection, Drug exposure during pregnancy, Thrombocytopenia

Symptom Text: Information has been received from a Nurse Practitioner, for the Pregnancy Registry for GARDASIL, concerning a 19 year old female with thrombocytopenia who on 09-MAY-2008 was vaccinated intramuscularly with a first dose of GARDASIL (lot # 659437/1266U). Concomitant therapy included tetanus toxoid, administered "on the same day, 09-MAY-2008") and vitamins (unspecified). On an unspecified date the patient had a positive urine pregnancy test. The patient's LMP was reported as 08-APR-2008. The patient sought unspecified medical attention. Patient outcome was not reported. Follow up information has been received from a completed questionnaire by a certified nurse midwife (previously reported as nurse practitioner). It was reported on the questionnaire that the patient with no concurrent medical conditions, on an unspecified date experienced Chlamydia infection (2 episodes) and thrombocytopenia (previously reported as concurrent condition) during pregnancy (diagnostic tests performed on unspecified dates). Other medications used during this pregnancy included prenatal vitamins (unspecified) and azithromycin. On 22-AUG-2008, the patient had a screening ultrasound. On 10-JAN-2009 at 39 weeks from LMP, the patient delivered a male liveborn infant. He weighed 8 lbs and 03 oz, apgar score was 8/9. Additional information is not expected.

Other Meds: azithromycin; vitamins (unspecified)

Lab Data: ultrasound, 08/22/208, screening; diagnostic laboratory, chlamydia positive X2; urine beta-human, positive; platelet count, thrombocytopenia

MedDRA PT Condition aggravated, Drug exposure during pregnancy, Pyelonephritis

Symptom Text: Information has been received through the Merck pregnancy registry from a registered nurse concerning a 21 year old female with no pertinent medical history and no history of drug reactions or allergies who on 03-APR-2008 was vaccinated with the first dose of GARDASIL (lot#: 659964/1978U) 0.5 ml IV, and on 05-JUN-2008 was vaccinated with the second dose of GARDASIL (lot#:658556/1060U). Concomitant therapy included BENADRYL and ADVIL. After vaccination on 05-JUN-2008, the patient mentioned that she may be pregnant. On 05-JUN-2008, a urine pregnancy test confirmed the patient was pregnant. The patient's last menstrual period was 20-APR-2008, the estimated delivery date is 25-JAN-2009. The patient sought medical attention with a physician office visit. Follow up information received on 28-MAY-2009 from a registered nurse stated that the coach with seasonal allergies and a history of pyelonephritis and one previous pregnancy that resulted in spontaneous abortion on 05-JUN-2008 at 11:15 a.m. received the second dose of GARDASIL intramuscularly into the left deltoid. Concomitant therapy included BENARYL, vitamins unspecified, and MACROBID given for history of pyelonephritis. The patient was prescribed ADVIL for pain. The patient had a ultrasound on 25-JUN-2008 which confirmed the EDC on 02-FEB-2009 and a MSAFP on 21-AUG-2008, which was normal. On 04-SEP-2008 the patient developed pyelonephritis. Her outcome was not reported. On 06-FEB-2009 the patient gave birth to a normal female at 40 4/7 weeks from LMP, who weighted 7 lbs; her apgar score was 8/9. It was reported that there were no complications, during pregnancy and labor/delivery. There were no congenital anomalies. No further information is available.

MedDRA PT Cystitis, Drug exposure during pregnancy, Influenza, Malaise

Symptom Text: Information has been received from a physician, for the Pregnancy Registry for GARDASIL, concerning a 21 year old white female with no significant past medical history or concurrent medical conditions and no previous pregnancies who on 20-FEB-2009 was vaccinated with the third dose of GARDASIL (Lot # 661954/1496X) by her obstetrician in another office. The patient's LMP was reported as 12-JAN-2009, EDD 19-OCT-2009. It was not reported whether the patients sought medical attention. Follow-up information was received from a registered nurse via phone call on 16-APR-2009 which reported that the patient told her that she had gotten GARDASIL during this pregnancy at a different office in another country. The patient was recently 13 weeks estimated gestational and had an EDD of 19-OCT-2009. According to the patient, the patient was told by her general practitioner that she should not breast feed this baby after birth, since she was exposed to the vaccine during pregnancy. The reporting registered nurse referred the patient to her obstetrician for further discussion. No further information was provided at this time. Follow-up information has been received from a pregnancy questionnaire. On an unspecified date in 2009, "during pregnancy", the patient experienced sickness, flu and bladder infections. The outcome was unknown. No other information was provided at this time. This is one of several reports received from the same source. Additional information has been requested.

MedDRA PT Wrong drug administered

Symptom Text: Information has been received from a registered nurse concerning an 11 year old female who on 11-MAR-2009 was vaccinated with GARDASIL (lot number, route and site not reported). Concomitant therapy included DAPTACEL and LUPRON. The patient was to receive DAPTACEL and MENACTRA. It was not product confusion. It was a human error on the part of the nurse. Based on child's age the nurse thought GARDASIL was to be given. The patient's mother did not want the child to get GARDASIL. No adverse effects noted. The patient sought medical attention. Follow up information was received from consumer concerning her daughter. The mother stated her daughter would not continue with the 2nd or 3rd dose of GARDASIL. Follow-up information has been received from a health professional concerning the 11 year old female who on 11-MAR-2009 was vaccinated with the first dose of GARDASIL (lot number 661846/1312X, route not reported) into her right deltoids. Concomitant therapy included her first dose of DAPTACEL, (lot number AC52B030AA, route not reported) into her left deltoid. The patient has two siblings. Additional information is not expected.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse for the pregnancy registry for GARDASIL concerning a 16 year old female, who on 26-FEB-2008 was vaccinated with the first dose of GARDASIL, on 19-MAY-2008, was vaccinated with the second dose of GARDASIL and on 08-OCT-2008, was vaccinated with the third dose of GARDASIL. The registered nurse reported that the patient received the GARDASIL vaccine while pregnant. The patient sought medical attention at the nurse's office. The estimated date of last menstrual period was 14-MAY-2008. The delivery date was 18-FEB-2009. The reporter stated that the pregnancy was normal and the baby was doing fine. Follow-up information was received from questionnaire completed by the registered nurse indicating that she was a patient with a history of 0 previous pregnancies, polycystic ovaries syndrome (so minimal ovulation's) and no concurrent medical conditions. The patient did not have infections or illnesses during pregnancy . Routine tests performed included: an ultrasound done at 28 weeks of gestation to track gestation age (first prenatal appointment); group B streptococcus test done 3 to 4 weeks before delivery resulting negative and a gestational diabetes test done at 30 to 32 weeks of gestation which resulted negative. Medication taken during pregnancy included children chewable vitamins taken daily since 28 weeks of gestation. The patient was not progressing past 8 centimeters. The patient gave birth to a normal female child, who weighted 8 pounds 3 oz. The baby did not have any congenital anomaly. Follow up information has been received from a physician via medical record which reported that the on 25-FEB-2009 the patient, the patient's mother and the baby went to the doctor's office. The baby's height was 20.5 inches. The baby was feeding with baby feeding formula (SIMILAC ADVANCED IRON) and baby drink 2-3 oz every 2-3 hours. The patient was still taking vitamins (physician suggested to take them until 6 weeks postpartum). Physician stated that the ba

MedDRA PT False positive laboratory result

Symptom Text: Information has been received from a medical assistant concerning a female who was vaccinate with on unspecified dates (doses and LOT# were not reported). When donating blood after vaccinated with GARDASIL the patient's parasite blood test showed positive for Chagas. Further testing showed the original test was false positive and she did not have Chagas disease. The patient was told that Chagas test showed positive was frequently see in patients that have vaccinated with GARDASIL. Follow-up information has been received via a phone call from the physician concerning a 17 year old female who was vaccinated with GARDASIL on unspecified dates (dose and LOT# were not reported). The patient attempted to donate blood and was told that she had a false positive confirmatory test for Chagas disease. It reported that the false positive test was related to the GARDASIL vaccination. Follow-up information has been received via a phone call from a medical assistant (M.A.) concerning the 17 year old female who on 06-AUG-2007, 15-NOV-2007 and 03-MAR-2008 was vaccinated with a dose of GARDASIL (LOT# not reported, 659435/1265U, 659182/1757U respectively). No other concomitant vaccines were given at the time of the GARDASIL doses. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Acute tonsillitis, Angina pectoris, Asthenia, Cyanosis, Disturbance in attention, Dizziness, Dyspnoea, Erythema infectiosum, Fatigue, Hyperventilation, Injected limb mobility decreased, Injection site pain, Myopericarditis, No reaction on previous exposure to drug, Pain in extremity, Pericardial effusion, Peripheral vascular disorder, Raynauds phenomenon, Tremor

Symptom Text: Case received from Health authority in a foreign country on 04-JUN-2009 under HA reference No. PEI2009011724. It was reported (according to information of the patient herself and the patient's parents) that an 18-year-old patient was vaccinated with a third dose of GARDASIL (lot #, injection route and site not reported) on 26-NOV-2007. Post vaccination she developed injection site reaction with pain and decreased limb mobility. Approximately 2 weeks post vaccination, the patient developed tremor of the hands, asthenia, tiredness, peripheral circulatory disorder, dizziness and impaired concentration. The patient was treated with beta blocking agents. In the beginning of 2008 she developed relapsing angina tonsillaris. All reported symptoms were ongoing, worsening respectively. On 07-SEP-2008 she was hospitalized due to hyperventilation syndrome with dyspnoea. On 17-SEP-2008 the patient was hospitalized again. Perimyocarditis was diagnosed. MRI showed a mild pericardial effusion. The patient was treated with ibuprofen and resting. Symptoms worsened and further cardiac diagnostics were carried out. In January 2009 final diagnosis of angina pectoris in the scope of microvascular dysfunction with persisting Parvovirus B19 infection was established. In the course patient developed "blue hands and toes" as well as pain in both feet. Raynaud's syndrome was suspected, but not verified through diagnostics including rheumatological check up (all normal findings). Concerning ongoing tremor exhaustive neurological examinations were carried out and showed all normal findings. Diagnosis of "increased physiologic tremor" was established. The patient presented to a natural healer and her condition improved under "detoxification" treatment. The final outcome was not reported. First and second dose of GARDASIL, both lot # not reported, administered on 13-APR-2007 and on 20-JUN-2007 respectively were well tolerated. Other business partner numbers include E2009-04684. No further information is available.

MedDRA PT Abortion induced, Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a health professional for the pregnancy registry for GARDASIL concerning a female with a history of atrial septal defect repair at age seven, who on 07-OCT-2007 was vaccinated with GARDASIL (lot # 656371/0181U). On 7-Jan-2008 the patient was vaccinated with her second dose of GARDASIL (lot # 655322/0092U). On 06-May-2008 the patient received her third dose of GARDASIL (lot # 655322/0092U). It was reported that the patient was found to be pregnant later the same day the last vaccination was given. A laboratory report was received in the office of a positive pregnancy test from the hospital the same day the last dose of vaccine was administered. Patient did not report the pregnancy. No problems were reported. Follow-up information has been received from a certified medical assistant who said that the patient was actually not pregnant at the time of the shot. She was not specific about which dose she was talking about. She reported that they found out that the patient lost the pregnancy a few days before her shot and very early in the pregnancy. She was not sure if it was an elective termination or a spontaneous abortion (SAB). Upon internal review, elective termination or a spontaneous abortion (SAB) was determined to be an other important medical event.

MedDRA PT Chemotherapy, Mediastinal mass, Non-Hodgkins lymphoma

Symptom Text: Information has been received from a pharmacist concerning an adult female with allergy to house dust and molds and contraception use who on 16-DEC-2008 was vaccinated with the third dose of GARDASIL (lot#1113U, batch#NH10090, injection site not reported) into the upper arm. Concomitant therapy included unspecified hormonal contraceptives. On an unspecified date the patient developed mediastinum tumor and the diagnosis of Non-Hodgkin's-Lymphoma was established on 18-MAR-2009. At the time of reporting, the patient was still under treatment with chemotherapeutic scheme BEACOPP (bleomycin, etoposide, adriamycin, cyclophosphamide, vincristin, prednisolone, procarbazine) and had not yet recovered. The first dose and second dose of GARDASIL (lot#1113U, batch#NH10090) were administered on 24-JUN-2008 and on 18-AUG-2008. Toleration was not reported. Non-Hodgkin's-Lymphoma was considered to be an other important medical event by the pharmacist. This case was linked with case E2009-03044 (WAES0904USA02133) (same reporter, same vaccine, similar event, but different batch number). Other company numbers included: E2009-04717. Additional information has been requested.

MedDRA PT Erythema, Pain in extremity, Pallor, Paraesthesia, Skin warm

Symptom Text: Information has been received from a physician concerning a 15 year old female with PENICILLIN allergy and no pertinent medical history who was vaccinated with three doses of GARDASIL (lot # 659435/1265U, exp: 16-JUL-2010) 0.5 ml, intramuscular administration. She received the first dose on 19-MAY-2008, the second dose on 09-JUL-2008, and the third dose on 05-NOV-2008. Concomitant therapy on 19-MAY-2008 included doses of ADACEL (lot # not reported), and MENACTRA (lot # not reported), other concomitant therapy included FLONASE. Two or three months after the third dose of GARDASIL (lot # 659435/1265U), exp: 16-JUL-2010, in January or February 2009, the patient experienced redness and tingling to the distal aspect of the feet when standing upright and redness in the left calf after walking, "such as in a mall". The patient was seen in the office on 24-APR-2009 and blood work was obtained. Results of labs were as follows: antinuclear antibody (ANA) and rheumatoid factor (RF) were negative. Urine drug screen (at the mom's request because she thought her daughter was doing drug) was negative. Sedimentation rate (sed rate) was 4, hemoglobin was 12.9, white blood cell count was 6.5, and platelet count was normal. The patient was seen again on 04-MAY-2009, and there was significant erythema, pinkness, and warmth distally when the left leg was in a dependent position. The patient was referred to a vascular surgeon for further evaluation. At the time of reporting the patient's symptoms persisted. Additional information has been requested. 7/13/09 Medical records received DOS 4/24/09 to 5/4/09. Assessment: Pain in limb/Bilateral, unchanged. Patient presents with feet that turn red and skin stings when she stands for over 10 minutes. Pain in calf when she walks in the mall. Pins and needles sensation in feet. Feet are erythematous, blanches, great toes are warmer than rest of foot. Surgical referral suggested.

Other Meds: FLONASE

Lab Data: Serum ANA 04/24/09 - negative; serum rheumatoid factor 04/24/09 - negative; urine drug screen 04/24/09 - negative; erythrocyte 04/24/09 4 - ; hemoglobin 04/24/09 12.9 - ; WBC count 04/24/09 6.5 - ; platelet count 04/24/09 - normal

MedDRA PT Diarrhoea

Symptom Text: Information has been received from a registered nurse concerning a 21 year old female with no pertinent medical history or drug reactions/allergies who "soon" before developing diarrhea on 01-MAY-2009 was vaccinated with the second dose of GARDASIL (lot # 661846/1312X) 0.5ml intramuscular administration. Concomitant therapy included SEASONIQUE, ascorbic acid, calcium, (unspecified), cyanocobalamin and minerals (unspecified) (+) vitamins (unspecified) (store brand WOMENS DAILY MULTIVITAMIN). On 01-MAY-2009 the patient experienced diarrhea. The first three days after onset were pretty bad. She called the office. The patient has diarrhea 3-4 times a day now. At the time of reporting, the patient was not recovered. Follow up information was received from a registered nurse concerning the 21 year old female student who on 01-MAY-2009 was vaccinated with the second dose of GARDASIL (lot # 661846/1312X) into the left deltoid. The patient had no illness at time of vaccination. On 01-MAY-2009, the patient complained with episodes of diarrhea 3-4 times a day from 01-MAY-2009 to 05-MAY-2009. She was advised to use IMODIUM, clear liquid diet and slowly advance to a bland diet. The patient was advised to call if symptoms unresolved. At time of reporting, the reporter had no further contact from the patient. It was unknown whether the patient recovered. Additional information has been requested.

MedDRA PT Condition aggravated, Crying, Drug exposure during pregnancy, Muscle spasms, Ovarian cyst

Symptom Text: Information has been received from a medical assistant and the patient's mother, for GARDASIL, a Pregnancy Registry product, concerning an 17 year old female with depression (diagnosed 3 years ago) and history of a cyst on her ovary (diagnosed 2 years ago) who on 21-APR-2009 was vaccinated with a first dose of GARDASIL (lot number 661846/1312X) (injection site and route not reported). There was no concomitant medication. Prior to receiving the vaccination, the patient had a negative urine pregnancy test (approximately 21-APR-2009), the patient's mother reported that on 04-MAY-2009 the patient started complaining about bad cramps that were so bad that she started to cry. The patient's mother called the physician who advised the patient be taken to the hospital for evaluation. The patient was brought to the emergency room but she was not admitted to the hospital and she was diagnosed with an ovarian cyst. The patient's mother said a blood pregnancy test, a urine pregnancy test and an ultrasound determined the patient was pregnant. As of 05-MAY-2009, the patient was five weeks, 4 days pregnant (LMP 26-MAR-2009, EDDD 31-DEC-2009). The patient had an appointment with an OBGYN. The patient's bad cramps (ovarian cyst) persisted. Additional information has been requested.

MedDRA PT Pain in extremity

Symptom Text: Information has been received from a healthcare worker concerning her 18 year old daughter who was vaccinated with the third dose of GARDASIL and later experienced intermittent pain or achiness in the arm where she received GARDASIL. Follow up information has been received from the healthcare worker and a nurse. It was reported that the 16 year old patient on 20-APR-2007 was vaccinated with the first dose of GARDASIL (Lot# 657617/0384U), on 8-AUG-2007 was vaccinated with the second dose of GARDASIL (Lot# 655620/0171U) and on 9-NOV-2007 was vaccinated with her third dose of GARDASIL (Lot# 658560/1062U). After vaccinated the third dose of GARDASIL, the patient had pain in the arm where she received the GARDASIL and the pain was "on and off". The patient went on to receive the following vaccinations: MENACTRA, Lot# 02343AA, ADACEL, Lot# AC52B015AA and the first dose of HAVRIX, Lot# 1280F, all administered on 22-JAN-2008. The patient received the second dose of HAVRIX on 21-AUG-2008. Lot# 1280F. The nurse stated that the patient had an appoint to see the physician on 08-MAY-2009. Additional information has been requested.

MedDRA PT Rash, Vaginal abscess

Symptom Text: Information has been received from a consumer concerning her daughter a 23 year old female with a history of eczema and Dairy allergies (cause of the eczema) who completed vaccination series of GARDASIL "just about a year ago". Concomitant therapy included omega-3 marine triglycerides, proboitics, and pure essential brand (Dr. Ashes Brand). The patient didn't experience any symptoms after the first or second dose of GARDASIL. Two days after the third dose the patient developed a vaginal rash during her menstruation the rash became worse. The patient also had "abscesses" that had developed on the outside of the vagina. She stated that the abscesses were caused from an e-coli bacteria. The patient had been test for sexually transmitted diseases, skin cultures, abscess cultures, and biopsies all of which had been negative. The mother also stated her daughter has not engaged in any sexual activity and could not identify a source for rashes. The patient had been placed on antibiotics that do not provide relief and was last prescribed a cortisone cream that states "has settled things a little bit this week during her period." The mother and her daughter believed in "doing everything natural and only received GARDASIL after it was highly recommended by a physician who is a friend of the family." The office manager at the gynecologist explained the patient didn't receive her vaccinations at their office and speculated that the vaccines were given either at school or by the patient's father, who is a physician. The patient was now visiting her physician about two times a week due to "flare ups" and was going to be seeing an infectious disease physician. The patient was not recovered. Additional information has been requested.

Other Meds: Omega-3 marine triglycerides

Lab Data: Biopsy, negative; Diagnostic laboratory, test for sexually transmitted diseases-negative; Skin and/or subcutaneous, negative; Abscess culture, negative

MedDRA PT Inappropriate schedule of drug administration, Papilloma viral infection

Symptom Text: Information has been received from a 36 year old female patient who in 2006 was vaccinated with the three doses of GARDASIL. The patient was now HPV positive. The consumer stated that she had only one partner in her life and she was vaccinated with GARDASIL before having sexual relations. The patient had not recovered. The patient contacted her physician. Follow up information has been received from the physician, who reported that the patient on 15-NOV-2006 was vaccinated with first dose of GARDASIL (Lot number 653736/0868F), on 26-JAN-2007 with the second dose of GARDASIL (Lot number 653736/0868F). The physician reported that on concomitant vaccines were given. The patient was last seen in the office in 2007, at which time her PAP smear was negative for HPV. Additional information has been requested.

MedDRA PT Headache, Injection site pain, Lethargy

Symptom Text: Information has been received from a nurse concerning her daughter a 14 year old female with amoxicillin allergy and no other medical history who in June 2008, was vaccinated with her first dose of GARDASIL (site and route of administration not reported). In September 2008, the patient was vaccinated with her second dose of GARDASIL (site and route of administration not reported). Concomitant therapy included a low dose of hormonal contraceptives (unspecified) to regulate her periods. In June 2008, on the day she received her first dose of GARDASIL the patient experienced sore arm at the injection site. In September 2008, the day after received her second dose of GRADASIL the patient experienced lethargy, severe headache and sore arm at the injection site. The lethargy and severe headache lasted for 2 days, and during that time the patient could not attend to school. The patient's mother could not confirm that her daughter was not able to attend the school due to the event. Subsequently, the patient recovered from lethargy and severe headache. The patient did not seek medical attention. Follow up call information received from a medical office assistant and registered nurse revealed that on 06-MAR-2008 the patient received her first dose of GARDSIL (lot # 659962/1740U), and on 02-JUL-2008 received her second dose of GARDASIL. Sore arm at the injection site developed on the day that 1st and 2nd dose were received, 02-JUL-2008 and 06-MAR-2008, respectively; lethargy and severe headache the day after 2nd dose was received on 03-JUL-2008. The nurse also confirmed that no other vaccines were administered at the same time as the GARDASIL doses. Additional information is not expected.

MedDRA PT Abdominal pain, Drug exposure during pregnancy

Symptom Text: Information has been received from a 23 year old female with no medical history or drug allergy who on 01-May-2009 was vaccinated with the first dose of GARDASIL and found out later she was pregnant. Concomitant therapy included Flagyl. The patient stated that her original visit to the practice was because she thought she was pregnant, however after a urine test the office stated she wasn't and administered the vaccine. The patient reported after getting the vaccine she started experiencing some abdominal pain and went for testing again and found out she was pregnant. The patient had "blood work" performed. At the time of the report the patient was recovered. No further information is available.

MedDRA PT Abdominal pain, Arthralgia, Decreased appetite, Dyspnoea, Fatigue, Feeling cold, Headache, Mood swings, Musculoskeletal chest pain, Myalgia, Oropharyngeal pain, Persistent generalised lymphadenopathy, Tachycardia

Symptom Text: Information has been received from a physician concerning a female patient about 20 years old who on an unspecified date was vaccinated with a dose of GARDASIL. It was reported that 2 months after GARDASIL the patient developed fatigue and generalized adenopathy. The patient consulted with the physician. It was reported that the patient had not recovered at the time of the report. Additional information has been requested. This is in follow-up to report (s) previously submitted on 6/12/2009; 6/18/2009; 6/30/2009. Information has been received from a physician concerning a female patient about 20 years old who on an unspecified date was vaccinated with a dose of GARDASIL. It was reported that 2 months after GARDASIL the patient developed fatigue and generalized adenopathy. The patient consulted with the physician. It was reported that the patient had not recovered at the time of the report. Information has been received from a physician via medical record concerning an 19 year old white student patient with allergy to apricots, cherries and almonds, a non smoker, rare alcohol user, she was sexually active and did have safe sexual practices, she was an immune competent patient, right handed and history of migraines, eczemn and cat scratch disease who on 15-AUG-2008 and in November 2008 was vaccinated with the first and second dose of GARDASIL. Other medications included ZYRTEC for which had been on for 8 years and birth control pills (unspecified) over the last year. The patient was evaluated for ongoing fatigue and intermittent adenopathy. It was reported that in September had developed a sore throat and question if the diagnosis had been a strep throat. She had been ill for about two weeks with arthralgias and myalgias. Just feeling poorly and subsequently after that developed bilateral rib pain that she felt was at the level of the ribs themselves. It was reported that she had not been doing any excessive coughing, but just had ongoing pain. At that particular time, did not receive any antibiotic th

MedDRA PT Hypoaesthesia, Mobility decreased, Oedema peripheral, Pain in extremity

Symptom Text: Information has been received from a physician, a consumer and a secretary concerning a 15 year old female patient with no history of allergies who on 08-MAY-2009 was vaccinated with the first dose of GARDASIL in her right arm. Almost immediately the patient felt like that she had no circulation and no blood flow. She experienced numbness, pain all down the arm and hand, and she had the inability to move and her hand became swollen. The patient's mother reported that the patient could not use her hand. There was no rash or itching and no systemic symptoms. On 11-MAY-2009 the patient went back to see her physician. The physician stated that it was GARDASIL that was causing the experience and she should not get any more doses of GARDASIL. The physician did not offer any treatment nor did he do any treatment. On 14-MAY-2009 the patient's hand was still swollen and had pain, but there was no more pain in her arm. The patient's mother gave the patient ADVIL 200 mg which seemed to help. The patient's mother reported that she was going to take the patient back to see the physician. The outcome for other adverse events was unknown. Follow up information was received from the physician which reported that on 08-MAY-2009, the patient with no pertinent medical history and no known drug allergy received four different vaccines. The patient was given GARDASIL (lot # 661766/0652X) and RECOMBIVAX HB (manufacturer unknown, lot # AHBVB663AA) in the right arm, ADACEL (lot #C3032AA) and MENACTRA (lot # U2842AA) in the left arm. On 11-MAY-2009, the patient came back to the office complaining of right arm pain and swelling. There was no redness and only minor swelling. No treatment was given, and cold compresses were suggested. On 18-MAY-2009, the patient again returned to the office complaining of right arm pain. The patient was seen by another physician who noted normal findings, but referred the patient to a neurologist. The physician could not say if the condition was disabling, but did say that the patient was

Symptom Text: Information has been received from a physician concerning a 17 year old female patient who on 27-Feb-2009 was vaccinated with the first dose of GARDASIL IM 0.5ml. On 01-Mar-2009 the patient developed a facial rash. There was no concomitant medication. On approximately 22-Mar-2009, after 2-3 weeks the rash resolved without treatment. The patient mentioned this adverse reaction on 13-May-2009, when she came to the office for her second dose of GARDASIL. No further information provided at the time of reporting. Follow up information has been received from another health professional reported that the 17 year old female patient was vaccinated with the second dose of GARDASIL (lot#: 661046/0546X) with an expiration of 01-Dec-2010 on 13-May-2009 and it was the only vaccine she received that day. It was confirmed that the patient recovered. No additional information is expected.

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse in a physician's office and a registered nurse in a county health department, for the Pregnancy Registry for GARDASIL, concerning a 21 year old female with a history of gestational diabetes with her first child and no drug reactions/ allergies who on 05-Feb-2009 was vaccinated IM with the first 0.5ml dose of GARDASIL (lot# 661954/1496X) in the physician's office. There was no concomitant medication. It was reported that the patient did not have a pregnancy test prior to the vaccination. Subsequently, the patient discovered that she was pregnant. The patient's last menstrual period was 03-Jan-2009, her estimated delivery date is on 10-oct-2009. On 05-Mar-2009, the patient had a prenatal ultrasound performed in the physicians office that reported her estimated date of confinement (EDC) to be 19-Oct-2009. The nurse also reported that along with the prenatal lab work the patient had preformed, she also underwent a 1 hour glucose test that she failed. She then underwent a 3 hour glucose tolerance test that was normal. The patient was referred to a county health department. Additional information has been requested.

MedDRA PT Fall, Head injury, Loss of consciousness, Nausea, Syncope

Symptom Text: Information has been received from a medical assistant concerning a 26 year old female who on 08-MAY-2009 was vaccinated with her first dose of GARDASIL. Subsequently the patient fainted. The patient has sought medical attention and had recovered. Follow up information has been received from this medical assistant concerning this 26 year old patient who was vaccinated with her first dose of GARDASIL (Lot# 660555/0279X). The patient did not received ant concomitant vaccines at report time. After receiving GARDASIL the patient stool up an fell down and lost consciousness. In the same day the patient regained consciousness. The patient had a "bump" on the right side of her forehead. The patient was nauseous. The patient has a "skull x-ray" which revealed no fracture. An ice-pack was applied to the right side of the patient's head. The physician's office contacted the patient on 09-MAY-2009. The patient stated that she felt fine. Additional information has been requested.

MedDRA PT Syncope

Symptom Text: Information has been received from a physician's assistant who reports an office had several patients faint after receiving GARDASIL. It was unknown exactly how many patients or time frame involved. The outcome of the patients was unknown. Follow up information was received from a office manager who said that their office was aware that "patients might faint when they get their GARDASIL vaccine" and that "patients faint all the time", therefore she was uncertain for the reason of the original report. She explained that details regarding individual patients would have to be discussed with the physician or physician's assistant upon their return. Attempts are being made to obtain additional identifying information to distinguish the individual patients mentioned in this report. Additional information will be provided if available.

MedDRA PT Hot flush, Laboratory test normal

Symptom Text: Information has been received from a certified medical assistant concerning a 25 year old female patient who on 17-APR-2009 received the first dose of GARDASIL (lot#661531/1311X) IM in her left arm. Concomitant therapy included NASONEX, hormonal contraceptives (unspecified) and ZYRTEC. On 17-APR-2009 the patient experienced hot flashes. The patient sought medical attention through an office visit. The patient's hot flashes persisted. Follow up information was received from a certified medical assistant on 27-MAY-2009. It was reported that the patient "would go ahead with doses #2 and #3." No other information regarding the AE was reported. On 28-MAY-2009, the certified medical assistant reported the following additional details: the patient had an allergy to ALUPENT, dust and pollen; no pertinent medical history; no other vaccines given at the time of the GARDASIL vaccination on 17-APR-2009; exact adverse event onset date was unknown, the patient simply reported at the 18-MAY-2009 office visit that she had been having hot flashes; some routine labs (not specified) drawn that day were all normal; hot flashes coincided with a new work-related stress, but did not go away when the work situation resolved; physician indicated that there was no correlation between the hot flashes and GARDASIL use; patient had to go to the office soon for the second GARDASIL dose; the patient after speaking with a co-worker, was interested in learning her "sugar level" so would see her primary physician. Additional information has been requested.

MedDRA PT Acne, Cellulitis, Drug toxicity, Eczema, Fatigue, Hyperhidrosis, Infection, Iron deficiency, Lymphadenopathy, Lymphomatoid papulosis, Mouth ulceration, Nausea, Oral contraception, Pneumonitis, Pruritus, Rash erythematous, Rash generalised, Rash papular, Rash pustular, Scar, Skin nodule, Skin ulcer, Urticaria, Weight decreased

Symptom Text: Information has been received from a physician concerning a female who was born on 09-Jun-1988 was vaccinated the first dose of GARDASIL (Merck) (LOT # 0210U), 0.5ml, on 23-MAY-2007. On 07-AUG-2007 she got the second dose of GARDASIL (LOT # 655620/0171U). There were no concomitant medications. Subsequently the patient experienced lymphomatoid papulosis after getting the first dose and second dose of GARDASIL. After that the patient sought medical attention. The patient never received the third dose. At the time of the report, the outcome was unknown. A medical assistant reported the patient's mother advised that the patient was undergoing treatment (no further information given) and would not be receiving the third dose. Additional information has been requested. 6/25/09 Medical records received DOS 12/28/07 to 12/24/08. Assessment: Lymphoid papulosis and iron deficiency. Patient presented with hives on upper extremities. Acne on face. Cellulitis L thigh, lymphadenopathy in groin. Lymphoid papulosis lesions on face, eyelid, legs buttocks. Shotty adenopathy neck. Infection R thigh. Oral contraceptives. Vaccine record: HPV-1 Merck 0210U RA 22.Nov.09 6/29/09 Medical records received 12/28/07 to 12/24/08. Additional information abstracted: Patient presented to oncology center with sweats at night, weight loss, rash and itching. Multiple open weeping papules yellowish in nature, others erythematous and reddish/brown, some are papulopustular. Present on eyelids, neck, arms, back, and posterior portion of legs. 8/24/09 Dermatology consult received. FINAL DX: lymphomatoid papulosis, type C, leaving scars. Records reveal patient experienced widespread & painful nodular lesions, ulcer on left hand, intermittent mouth sores, fatigue, nausea. Tx w/methotrexate starting 6/08, clobetasol propionate cream & folic acid. Developed MTX-induced pneumonitis. MTX d/c'd. Punch biopsy done when developed scaly patches c/w eczematous dermatitis. Tx w/PUVA & Oxsoralen starting 12/08 w/good results.

Symptom Text: Initial case was reported on 02-JUN-2009 by a patient and additional information from healthcare professional was received on 04-JUN-2009 concerning a 30 year old woman who was vaccinated with the first, second and third dose of GARDASIL on 10-APR-2007 (lot#654740/0859F, batch# NE37970), 20-JUN-2007 (lot#655376/0572F, batch#NE47370) and 10-OCT-2007 (lot#655376/0572F, batch#NE47370). On an unspecified date sometime after vaccination with dose one in 2007 the patient experienced itching eyes, sneezing and tiredness. These symptoms aggravated on unspecified date following vaccination with the second dose. Now the patient reacted to her pets, got headache, and experienced red eyes constantly and a general malaise (unspecified date in 2007). After the third dose of vaccine the patient developed dyspnea that aggravated with time (unspecified date). The patient visited the hospital and was diagnosed with allergy to mugwort, dog, mite and mold (unspecified date). No pharmaceutical treatment was taken for the condition since the patient was skeptical towards drugs considering her medical history (a lot of side effects, please see below). In February/March 2008 the patient developed a terribly itching rash covering the entire front side of her body, from neck to feet. The doctor could not diagnose the patient, however suspected psoriasis, and prescribed weak steroids and sleeping pills. The symptoms persisted and the patient also developed a constant fever (unspecified date in 2008). After another visit to another doctor the patient was prescribed stronger steroids that made the symptoms go away. Another doctor later diagnosed the itchy rash as urticaria. As the dyspnea aggravated the patient saw a new doctor and was examined with lung x-ray to rule out angioedema (unspecified date in 2008). The results came out normal. BRICANYL for the dyspnea and corticosteroids (manufacturer unknown) for the urticaria (in case of recurrence) was prescribed. 1-2 weeks after the hospital visit the patient woke up in the middle of night wi

Symptom Text: Case received from a specialist in hospital on 04-JUN-2009 and transmitted via a sales representative. A 16 year old female patient experienced idiopathic thrombocytopenic purpura (ITP) after she received the third dose of GARDASIL (batch number not reported) on an unspecified date. Two months after vaccination, the patient presented with ITP with platelets at 10000. She was treated with corticosteroids (unspecified) but experienced a significant diabetic decompensation. Afterwards she presented with vulvar condylomatosis. At the time of reporting for typing was oncogene, HPV 16 was detected. To be specified that before the administration of the first dose of GARDASIL, the patient was sexually active and her platelets count was 110000. According to the gynecologist, condylomata were related to sexual relationships prior to vaccination and for the hematologist, ITP was not related to vaccination. Both specialists ie gynecologist and hematologist considered that vaccination could have been a trigger factor. Idiopathic thrombocytopenic purpura, diabetes steroid-induced, vulvovaginal condyloma and pap smear abnormal were considered to be other important medical events by the specialist. Other company numbers included E2009-04812. No further information is available.

MedDRA PT Menorrhagia

Symptom Text: Information has been received from a physician concerning a 16 year old female patient who "a couple of months ago" was vaccinated with the first and second dose of GARDASIL vaccine (Lot # not reported). It was reported that the patient experienced heavier menstrual cycle after receiving the first and second dose of GARDASIL vaccine. The patient was seen by the physician. The outcome of the patient was unknown. It was reported that the therapy with GARDASIL was discontinued on an unspecified date. Additional information has been required.

MedDRA PT Haemorrhage, Pruritus, Rash

Symptom Text: Information has been received from a physician concerning a 25 year old female with a history of miscarriage before the vaccination who on 12-MAY-2009 was vaccinated with the first dose of GARDASIL (LOT # 0294Y, 0.5ml, intramuscular administration). There was no concomitant medication. The patient developed rash on her both arms and legs one week after the vaccination. The patient called the office and described the rash as itchy and "bursting" blood vessels. At the time of reporting the patient was recovering. Additional information has been requested.

MedDRA PT Dizziness, Tachycardia

Symptom Text: Information has been received from a physician concerning an 11 year old female who on 19-MAY-2009 was vaccinated with the second dose of GARDASIL (LOT# 661841/0653X, route and site of administration not reported). The patient experienced dizziness after getting the second dose of GARDASIL and about 4 to 7 hours later she became tachycardia up to 150 that stayed for 2 or 3 days. She received the first dose of GARDASIL (LOT#, route and site of administration not reported 0.5ml) on 19-MAR-2009 with no adverse event. The outcome of dizziness was unknown. Follow up information has been received on 29-MAY-2009. It was reported by the office manager that on 19-MAR-2009 the patient received the first dose of GARDASIL (lot#661952/1129X), VAQTA (lot#662532/1584X), ADACEL (lot#UF452AA) and MENACTRA (lot#42870AT). On 19-MAY-2009 the patient went to the Emergency Room for some unspecified medical attention. In additional follow up the responsible physician stated that the patient was not admitted to the hospital. The patient's EKG revealed Sinus Tachycardia, heart rate 140 to 150. The tachycardia lasted for one day. The patient's dizziness and tachycardia resolved. The patient was referred to cardiologist. The patient had an appointment at the vaccinating physician's office on 26-MAY-2009 and the patient was completely normal. It was reported that the patient was scheduled for the third dose of GARDASIL in 3 and a half months. No further information is available. The patient was treated in the emergency room at hospital.

MedDRA PT Drug exposure during pregnancy, Premature labour

Symptom Text: Information has been received from a nurse practitioner for GARDASIL, a Pregnancy Registry product, concerning a 23 year old female with allergies to sulfa, MACROBID and a medical history of Attention Deficit Disorder, depression, anxiety and obesity who on unspecified date was vaccinated with the 1st and 2nd dose of GARDASIL. Concomitant therapy included EFFEXOR and NECON 1/35. The doses were administered at a different facility so the nurse practitioner did not have specific dates or lot numbers. The nurse practitioner stated that the patient did not document if she received any concomitant vaccines when she received the GARDASIL. Subsequently, after two doses of GARDASIL, the patient became pregnant. Unspecified medical attention had been sought. The patient delivered her baby at 33 weeks on 20-Oct-2008. The patient told the nurse practitioner that the baby was "doing great". Dose 3 has not been administered yet. Dose 3 was due in April 2008 but was never administered. At the time of reporting, the patient status was "fine". Additional information has been requested.

MedDRA PT Headache, Myalgia, No reaction on previous exposure to drug, Urticaria

Symptom Text: Information has been received from a physician concerning a 15 year old female student with no medical history and no known drug allergy who on 25-FEB-2009 at 13:45 was vaccinated with the first dose of GARDASIL IM into her left deltoid (lot # 660612/0229X). On the same day at 13:45, the patient also received the first dose of ADACEL IM into her right deltoid (lot # C3031AA). There was no illness at the time of vaccination. On 26-FEB-2009 the patient's mother stated that the patient went to bad awake with sore muscles and headache after vaccines. The patient was given ibuprofen and the adverse events had relief. On 30-APR-2009, the patient returned for the second dose and her mother noted that she forgot to mention that the patient had hives on arms and chest after vaccines. The physician advised against the second injection. The patient had had prior ADACEL without reaction. At the time of reporting, the outcome was unknown. The patient did not seek medical attention. Additional information has been requested.

MedDRA PT Injection site erythema, Injection site mass, Injection site pain

Symptom Text: Information has been received from a Certified Medical Assistant (C.M.A.) concerning a 24 year old female patient who on 13-MAR-2009 was vaccinated with the first dose of GARDASIL vaccine (Lot # 661846/1312X) with no incident. On 01-MAY-2009 the patient received the second dose of GARDASIL vaccine (Lot # 658271/0558X). There was no concomitant medication reported. It was reported that "26 days after receiving vaccine", on 27-MAY-2009, the patient developed a red bump at the injection site after receiving GARDASIL vaccine. On 27-MAY-2009 the patient called to the office to report that she has developed a "bump" under the skin at the injection site was painful to the touch. There were no laboratory diagnostic tests performed. The patient has not been seen by the physician for evaluation but was offered a physician's appointment and the patient stated that "she would call back to schedule and appointment to see the physician if the bump under skin at the injection site and the pain to touch persisted". It was reported that the patient had not recovered at the time of the report. Additional information has been requested.

MedDRA PT Brachial plexus injury, Condition aggravated, Laboratory test, Nuclear magnetic resonance imaging, Vaccine positive rechallenge

Symptom Text: Information has been received from a consumer concerning his 16 year old daughter with "brachial plexus" of her right arm which was diagnosed a few years ago, and allergy to viral medications (it caused brachial plexus) who on 01-OCT-2008, 02-DEC-2008 and on 21-APR-2009 was vaccinated with the first, second and third doses (o.5 ml) of GARDASIL (Lot # not reported) respectively. Concomitant medication included "pain medication" (unspecified). It was reported that "after first dose" of GARDASIL the nerve damage on her right arm "flared up". After receiving her second dose of GARDASIL the nerve damage (brachial plexus) occurred on her left arm. It was reported that after receiving her third dose of GARDASIL the nerve pain (brachial plexus) "flare up" on her right arm again. The patient sought unspecified medical attention. There were "numerous laboratory work, MRI" performed (results not provided). It was reported that the patient was recovering at the time of the report. No further information is available.

MedDRA PT Nervousness, Syncope

Symptom Text: Information has been received from a registered nurse (R.N.) concerning a female who on 27-MAY-2009 was vaccinated with a dose of GARDASIL (LOT# not reported). It was unknown which dose in the series the patient received. On 27-MAY-2009, since vaccination, the patient fainted after receiving the vaccination. The nurse did not think the fainting was related to the vaccine and stated, "thought the patient was nervous and skittish about shots". It was reported that the patient sought medical attention in the office. The patient's outcome was unknown. Follow-up information has been received from via a phone call from the registered nurse (R.N.) concerning a female who on months ago was vaccinated with the first dose of GARDASIL (LOT# not reported). The registered nurse said the patient was fine. The mother reported that the patient usually dose this when she gives blood or gets shots. The registered nurse (R.N.) contacted during telephone follow-up could not supply the following information: patient name, date of birth, lot number, date of event and recovery status. No further information is available at this time.

MedDRA PT Orthostatic hypotension

Symptom Text: Information has been received from a physician concerning four female patients who were vaccinated with doses of GARDASIL vaccine. Subsequently the patients experienced postural hypotension. Unspecified medical attention was sought. At the time of this report, the outcomes were unknown. Follow up information was received from a physician on 26-MAY-2009. The patient was the nurse's daughter. The physician stated that after further discussions, it was decided that there was no relation to these events and the GARDASIL vaccination. The physician was confident that the patient was fine. This is one of several cases from the same source. No further information is available.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Condition aggravated, Fatigue, Incorrect route of drug administration, Neutropenia, Thrombocytopenia, Viral infection

Symptom Text: Information received from the foreign Health Authorities via Sanofi Pasteur MSD as part of a business agreement, concerning a 15-year-old female patient received the first and second dose of GARDASIL (S.C., batch number not reported) via subcutaneous route instead of intramuscular route in March and April 2009, on month apart. She had a history of chronic idiopathic thrombocytopenic purpura discovered at the age of 3 years old. The patient's thrombocytopenia had always remained stable around 60g/l. In July 2008, i.e. three months after the second dose of GARDASIL, the patient developed a thrombocytopenia at 14 g/l which necessitated a treatment by immunoglobulins and she was hospitalized. A clinical examination was performed on 18-Nov-2008. There was no hemorrhagic symptomatology, but signs of a viral syndrome were found. Thrombocytic count was at 133g/l. To be noted a neutropenia with neutrophils at 0.94 g/l, in a context of fatigue which was perhaps in connection with current viral syndrome. The patient was hospitalized for the events of fatigue and viral syndrome. It was decided not to administer the third dose of GARDASIL. At the time of reporting, the patient had recovered from thrombocytopenia and fatigue. The outcome of the viral syndrome was not provided. The Health Authorities assessed the causal relationship between the reported reactions and vaccination as doubtful (S2 S1 T1) according to the foreign method of assessment. No further information expected. Other business partner numbers include E200904715.

MedDRA PT Mitochondrial cytopathy, Surgery

Symptom Text: Information has been received from a physician concerning a female patient who was vaccinated with GARDASIL. The patient received the first dose of GARDASIL and a week and half later she was scheduled to have heart surgery due to a hole in a heart that patient already had. Then after surgery the patient started to experience illness on a mitochondrial level. The physician stated that the patient was hospitalized due to surgery but did not specify how long the patient was in the hospital. Illness on a mitochondrial level was considered to be immediately life-threatening and disabling. At the time of this report, the patient was recovering. No further information is available.

MedDRA PT Asthenia, Autonomic nervous system imbalance, Dizziness, Exertional headache, Hypothyroidism, Inflammation, Peripheral vascular disorder, Presyncope, Syncope, Vertebral artery hypoplasia, Vertigo

Symptom Text: Information has been received from a health authority under HA reference no. PEI2009012057. It was reported that a 13 year old female patient with a history of vegetative regulation disorder in the context of post inflammatory hypothyroidism and infection NOS who on 15-NOV-2007 and 24-JAN-2008 was vaccinated with the first and second dose of GARDASIL (both lot # 0354U; batch # NF58150). Dose 1 and dose 2 were well tolerated. The patient was vaccinated with the third dose of GARDASIL (lot # 0466U; batch # NG34890) on 27-MAY-2008. Since spring 2008 (exact date not reported) the patient developed dizziness, exertional headache during competitive swimming, peripheral circulatory disorder, pre-syncope and syncope. Routine laboratory findings showed normal results in APR-2008 and JUN-2008. EBV antibody test on 03-JUN-2008 showed a past EBV infection: EBV-VCA-IgG antibody: 283.0 E/ml EBV-EBNAI-IgG antibody: >600.0 E/ml Thyroid diagnosis on 18-JUN-2008: Suspicion of disseminated autonomy confirmed by a positive elevated TRH test. Sonography of the abdomen showed a left adrenal gland area with round, low echo and a well limited volume of 1.5 cm diameter. The patient was hospitalized from 20-AUG-2008 until 22-AUG-2008 due to clarification for dizziness attacks on exertion with syncope and pre-syncope. After an infection (not otherwise specified) at the beginning of 2008 the patient showed a marked lactate value. Additionally she had developed vertigo (onset not reported). Long-term medication with levothyroxine L-THYROXIN 200 ug. On 14-AUG-2008: Sonography of the abdomen showed normal results. Laboratory findings 22-AUG-2008: Borrelia antibodies (IgG and IgM) were negative. Free T4: 1.88 (slightly increased). On 20-AUG-2008: Echocardiography showed normal results. Stress ECG was discontinued by the patient due to vertigo, feeling of weakness, vegetative symptoms and affective reaction up to a level of exertion of 150 watts, otherwise normal findings. Duplex sonography showed hypoplasia of right vertebral artery compensated

Other Meds: L-Thyroxin

Lab Data: diagnostic laboratory test, ??Apr08, normal; diagnostic laboratory test, ??Jun08, normal; abdominal ultrasound, 18Jun08, a left adrenal gland area with round, low echo and a well limited volume of 1.5 cm; echocardiography, 20Jun08, normal;

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Convulsion, Hypoaesthesia, Paraesthesia

Symptom Text: Information has been received from parents, a physician and a medical assistant concerning a 19 year old female with anxiety, depression, asthma, twitching and tremor and a history of spinal fracture who was vaccinated with three doses of GARDASIL. The patient received the first dose of GARDASIL (Lot# 660618/0572X) on 17-NOV-2008. The patient received the second dose of GARDASIL (Lot# 661766/0652X) on 20-FEB-2009. The patient experienced numbness and tingling after the second dose. The numbness and tingling was never reported to the physician. The patient received the third dose of GARDASIL (Lot# 661846/1312X) on 05-JUN-2009. Concomitant therapy included ZOLOFT, hydromorphone, albuterol, montelukast sodium (MSD) and HOMACCORD. The medical assistant also reported that the patient had received a influenza virus vaccine (unspecified) shot on 13-OCT-2008. No other vaccines was given at the time of the GARDASIL doses. The parents reported that on 08-JUN-2009 the patient experienced seizures after the third dose. The patient was hospitalized on 9-JUN-2009 until 11-JUN-2009. The patient was still having seizures even after she was discharged from the hospital. Full blood chemistry panel and electroencephalography (EEG) were performed (results not provided). According to the medical assistant, hospital records from the June 2009 admission had not yet been received by the physician's office, but a written chart note indicated that the event did not look like a seizure. Event was not considered as disabling or life threatening. The patient would see a neurologist on 24JUN-2009. At the report time the outcome was unknown. Additional information has been requested.

Other Meds: hydromorphone; SINGULAIR; ZOLOFT

Lab Data: electroencephalography, results not provided; full blood chemistry, results not provided

History: Spinal fracture

MedDRA PT Abdominal pain, Asthenia, Confusional state, Decreased appetite, Dizziness, Dyspnoea, Fatigue, Feeling abnormal, Feeling hot, Gaze palsy, Hypotonia, Immediate post-injection reaction, Loss of consciousness, Musculoskeletal stiffness, Pallor, Parosmia, Presyncope, Syncope, Tremor, Visual impairment

Symptom Text: Pt. had fainting episodes with 1st dose of GARDASIL on 4/7/09. With this 2nd GARDASIL & within seconds pt. got pale, as she was laying down her eyes rolled back, got stiff & shook about 2-3 times. Resolved quickly. Physician came immediately & saw her recovered. Episodes of vomiting for 1 hr. Pt home. 9/22/09-records received for dates of service-6/26/09-8/13/09-neurology consult-evaluation for 2 episodes associated with Gardasil. Blacked out at time of injection-body stiffening and shaking eyes deviated upward. First event 4/7/09 C/O felt weird and ears heard rushing unable to see as black came into her vision. C/O being hot, lost consciousness and was limp. Confused regarding circumstances-no change in mental status. 2nd event 6/15/09-lost consciousness, stiffening and shaking of whole body, weak afterward, pale and greenish. Vomited. C/O abdominal pain and bothered by smells, dizzy and short of breath wi th stairs. Appetite decreased for 6 days. Follow-up visit 8/13/09-no further episodes of loss of consciousness or seizures. C/O vision will become black when changing from sitting to standing. C/O tired. Long history of being tired. Assessment: most likely represented convulsive syncope particulary given her history of other vasovagal presyncopal events.

MedDRA PT Abdominal pain, Amnesia, Anxiety, Blindness transient, Convulsion, Dizziness, Gaze palsy, Immediate post-injection reaction, Loss of consciousness, Malaise, Musculoskeletal stiffness, Nausea, Pallor, Syncope, Tremor, Tuberculin test, Vaccine positive rechallenge, Vomiting

Symptom Text: Information has been received from a mother concerning her 18 year old daughter with no medical history and drug reactions who on 09-APR-2009 was vaccinated with her 1st dose of GARDASIL, 0.5 ml, IM. She went blind, got dizzy and then passed out. She fully recovered that same day. On 15-JUN-2009, the patient was vaccinated with the 2nd dose of GARDASIL, 0.5ml, IM. There was no concomitant medication. Then she passed out immediately, and had 3 mini-seizures. The mother didn't know if there was blindness or dizziness because her daughter passed out immediately. Since then she had nausea and vomiting and couldn't keep anything down. The patient had recovered from the seizures and syncope, but her nausea and vomiting persisted. The patient had sought medical attention. There were no labs and diagnostic tests performed. The mother felt that her daughter's blindness and 3 mini-seizures were considered to be important medical events. Additional information has been requested. 7/13/09 Medical records received DOS 4/7/09 to 6/19/09. Assessment: Shuddering episode related to syncope. Post vaccination patient became pale, eyes rolled back, got very stiff, shook 2 or 3 times. Loss of memory during episode. 5 vomiting episodes later at home. Also received PPD that day. Nausea, abdominal pain, 'not feeling right'. Dizziness, anxiety.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Drug exposure during pregnancy, Neonatal disorder

Symptom Text: Information has been received from a physician for the Pregnancy Registry for GARDASIL concerning a 22 year old female who on 06-SEP-2007 was vaccinated intramuscularly with her first dose of GARDASIL (lot# not reported). There was no concomitant medication. On 08-NOV-2007 the patient was vaccinated intramuscularly with her second dose of GARDASIL (lot# 659435/1265U) and was pregnant. The patient's LMP was originally reported as 08-NOV-2007 with a due date of 14-AUG-2008. However the follow up information indicated an LMP date of 29-Oct-2007 with an estimated delivery date of 06-Aug-2008. The patient had an ultrasound on 21-Dec-2007 and sought medical attention in the physician's office. Follow up information has been received from a certified medical assistant on 19-FEB-2009. It was reported that the patient delivered vaginally, a normal and healthy baby boy on 30-JUL-2008. His birth weight was 7 lbs 5 oz; length: 201/4"; Apgar 9/9. She mentioned that the patient was just in their office last week and "was doing fine." Pediatric medical records were received and reviewed and the following experience was identified: On 05-AUG-2008 the infant was seen in the clinic. The physician reported that the baby had plenty of wet diapers and had been eating well, but since yesterday his feeding had decreased. The diagnosis was decreased feeding x1 day and mom was to call if no improvement. On 07-AUG-2008, 08-AUG-2008 and 12-AUG-2008 the baby was again seen by the physician and continued to have poor feeding with stable weight but no gain. The mother reported that she had to wake him every 4 hours to feed and she couldn't get him to take more than 1 and a 1/2 oz at a time. On 12-AUG-2008, his weight was 6 lbs 15 ozs. The physician's plan was to put him on soy formula and if no change in weight would do some labs. On 15-AUG-2008 the baby was seen for weight check. His formula intake was still down. He was taking approximately 10 oz per day. His bowel movements (BM's) were "hard, pebble-like" and his gu

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Foetal disorder

Symptom Text: Information has been received through the Merck pregnancy registry for GARDASIL from a registered nurse concerning a female patient who on 17-JUN-2008 and 24-OCT-2008, was vaccinated with first and second dose respectively of GARDASIL (dose, route and lot number not reported). The registered nurse reported that the patient found out that she was pregnant in February 2009, but "the baby stopped growing at 10 weeks" and she lost her pregnancy in March 2009. It was reported that the patient waited for one month following the loss and had became pregnant again (WAES 0906USA02053). The registered nurse reported that the patient was not pregnant at the time of her previous two vaccinations. Upon internal review, the baby stopped growing at 10 weeks and she lost her pregnancy were determined to be other important medical events. This is one of two reports regarding the same patient. Additional information has been requested.

MedDRA PT Convulsion, Dizziness, Syncope

Symptom Text: Information has been received from a physician concerning a 15 year old female who in approximately 2009 was vaccinated with GARDASIL first dose. Approximately 20 minutes after vaccine administration the patient experienced convulsion, faint and dizziness and was hospitalized (treatment received, final diagnose, dates or other details not reported). Causality and outcome are not available. After several attempts no further information could be obtained. No further information is available.

MedDRA PT Polyarthritis

Symptom Text: Information has been received from a General Practitioner (G.P) concerning a 15 year old female patient with a good general health status and no familial medical history who in January 2009 was vaccinated with the third dose of GARDASIL (Batch # not reported). It was reported that 3 months after vaccination, she developed a beginning of chronic evolutive polyarthrits. She was treated with non steroidal anti-inflammatory drugs. In addition, it was planned that she would be given methotrexate 10 mg per day. At the time of reporting, the patient had not recovered. The primary reporter considered chronic polyarthritis to be another important medical event. Other business partner numbers include: E2009-04846. No further information is available.

MedDRA PT Urticaria

Symptom Text: Grandmother called clinic on 6/19/09 after child received third dose of the HPV vaccine on 6/17/09. Per Grandma, the child had no immediate problems following vaccination. On the morning of 6/18/09, child woke up with hives on both upper extremeties. On 6/19/09, child woke up to find additional hives on both upper extremeties, which also increased in size. Denies itching or difficulty breathing. No treatment had been administered at the time Grandma reported this event. Advised to utilize over the counter antihistamine for immediate symptom management and contact primary care provider for further instructions.

MedDRA PT Inappropriate schedule of drug administration, Tremor

Symptom Text: A 1 year old female patient received a first time dose of ADACEL (lot number C3005) intramuscularly in the left thigh, MENACTRA (lot number U2910AA) intramuscularly in the right thigh on 15 June 2009 at 3:30 PM. At 10:00 PM the patient "had the shakes" which lasted until 4:00 AM. The patient's mother brought the patient to the emergency room following the inadvertent administration of the products. The patient was treated with a dose of TYLENOL. The patient's mother stated that the patient "seemed okay, but was not sure". Recovery status was reported as unknown. List of Documents held by Sender: none. Follow up information received on 15 July 2009 from a health care professional. Four weeks prior to vaccination, on 18 May 2009 the patient received a second dose of DAPTACEL (lot number C30818A) and PREVNAR (manufacturer Wyeth, lot number D39016) both intramuscularly in the right leg. On 15 June 2009 the patient received ADACEL in the right leg, previously reported as the left leg and GARDASIL (manufacturer Merck, lot number 0652X) intramuscularly in the left leg. The patient experienced the shakes off and on through the hours of 10 PM and 4 AM. During this time the patient did not lose consciousness or retain a fever. There was no health care professional present during the hours of 10 PM and 4 AM. The patient does not have a personal or family history of tremors. No further treatment was received or lab work was completed. The patient was seen in the emergency room for precautionary measures only. The child had recovered within a 12 hour period and was without any further incidents. List of Documents held by Sender: none.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Neonatal disorder

Symptom Text: Information has been received from a 17 year old female, for the pregnancy registry for GARDASIL, with asthma and VICODIN allergy, who in January 2008, was vaccinated with the first dose of GARDASIL. On 21-MAR-2008, the patient received the second dose of GARDASIL. Concomitant therapy included albuterol. The patient reported that on 25-MAR-2008, she found out she was pregnant. On an unspecified date, the patient had a pregnancy test that was positive. At the time of the report, the patient was 22 weeks and 4 days gestation. Her LMP was 15-FEB-2008 and EDD 21-NOV-2008. The patient sought medical attention. Follow-up information was received from a nurse who reported that on 17-NOV-2008, the patient had a cesarean section done because her baby was in a breech position. The patient reported the baby's weight at birth was 7 pounds and 13 oz. At the time of the report, the patient reported that she had a six month old "healthy and big" baby who weighed 20+pounds. The patient stated that the baby had asthma, and an inhaler, but that he was doing ok with that; and that the doctors were trying to figure that out, but did not know if he had allergies or not yet. At the time of the report the patient stated that she was feeling better from the cesarean section but still felt a little tender sometimes. Additional information has been requested.

Other Meds: albuterol

Lab Data: beta-human chorionic, "positive"

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received through the pregnancy registry for GARDASIL from a registered nurse concerning a 14 year old female with no pertinent medical history and no history of drug reactions or allergies who on 18-AUG-2008 was vaccinated with the first dose of GARDASIL (lot#: 659653/1448U) 0.5ml IM. There was no concomitant medication. A subsequent pregnancy test on the same day was positive. No problems were reported. The LMP was "3 weeks ago" (on approximately 29-JUL-2008). The EDD is 05-MAY-2009. The patient sought unspecified medical attention. Follow up information has been received from a registered nurse concerning the 14 year old female patient who on an unspecified date had a pregnancy termination. Upon internal review, pregnancy terminated was considered to be an other important medical event. Additional information is not expected.

MedDRA PT Activities of daily living impaired, Arthralgia, Bronchitis, Chest pain, Chronic fatigue syndrome, Contusion, Cough, Depression, Dyspnoea, Fatigue, Gene mutation, Hypophagia, Immobile, Immune system disorder, Infectious mononucleosis, Injection site pain, Malaise, Myalgia, Pain in extremity, Paralysis, Paranasal cyst, Postnasal drip, Rhinitis, Sinusitis, Splenomegaly, Surgery, Viral infection, Weight decreased

Symptom Text: Information has been received from a consumer concerning her approximately 17 year old daughter with no medical history or allergies who was vaccinated with three dose of GARDASIL. Concomitant therapy included "LOLESTRA". The consumer reported that after receiving the first and second dose of GARDASIL the patient experienced injection site soreness but then was fine. Then about three weeks after receiving the third dose of GARDASIL. The patient experienced bruising in her leg which caused immobility, which they thought was a blood clot so they took her to the emergency room and had to stabilize her leg and then shortly after the bruising cleared up. Then in September 2008 the bruising came back in her leg and starting in November 2008 the patient started to get sick constantly. The patient could not move, was very exhausted, lost about 7 pounds, could not eat, and had breathing problems. The patient was taken to a pulmonologist because her pediatrician thought she may have walking pneumonia, mono or asthma, but they were all ruled out. Then the patient was taken to a physician who ran a bunch of blood test, and computerized tomography scan (CT) of her brain and a magnetic resonance imaging (MRI) of her left leg. The MRI and CT scan came back fine, but the physician stated that through the blood work the patient's immune system was compromised and believed it was from GARDASIL " The patient then started to get a lot of sinus infections and developed cyst in her sinus so she had out patient surgery (name of hospital, address and phone number unspecified)." The consumer reported that in mid May 2009 the patient developed mono and had been doing better but still got exhausted pretty fast, and had missed about 45 days of school this past school year. The patient was seen by the pediatrician to seek medical attention. At the time of report, the patient was recovering. Upon internal review, mononucleosis and bruising in leg were considered to be disabling. Additional information has been requested. 7/24/09 Clinical s

MedDRA PT Blood pressure decreased, Dizziness, Headache, Heart rate normal, Nausea, Skin warm, Tremor

Symptom Text: Date: 5/28/09. Vaccines were administered and the patient remained in the exam room in a supine position for 15 minutes, with an additional 10 minutes spent in the clinic. One hour later, she presented to the school nurse with complaints of dizziness and nausea. Per the school nurse, her BP at that time was 88/62, pulse 96. (Her BP on previous exam ranged from 97/66 to 110/73). She had no dyspnea, pruritis, hives, diaphoresis, or mental status changes. Her nausea improved, but she complained of a headache after 15 minutes, at which point her BP was 88/64, pulse 76. At discharge home in the care of her parent, the school nurse also reported the patient's entire right arm was warm to the touch, with tremors. The patient experienced brief dizziness when she first sat up, but recovered quickly. OTC BENADRYL was administered by patient's mother. The patient returned to school the following day and reported no further episodes.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Drug exposure during pregnancy, Foetal heart rate abnormal, Intra-uterine death

Symptom Text: Information has been received from a physician concerning a female who was vaccinated with three doses of GARDASIL, intramuscular injection. The physician found out "later on" that the patient was "4 days pregnant when she received the last dose" (third dose) of the vaccine. The reporter felt that pregnant was not related to therapy with GARDASIL. On 7-MAY-2009, the following follow-up information was received: The patient is a 29 year old female with a history of 1 pregnancy and 1 live birth. On 12-APR-2009, the patient was vaccinated with the third dose of GARDASIL, intramuscular. Details of the first and second doses are unknown. Her Last Menstrual Period was on 20-MAR-2009. Estimated delivery date is 29-DEC-2009. The patient is not on any concomitant therapy. On 9-JUNE-2009, the following follow-up information was received: During the patient's first visit to the physician, the fetus "was fine"; "limbs were ok". On either the 2nd or 3rd visit which was last week (approximately 5-JUNE-2009), the physician noticed that the fetus had no heart beat. Subsequently, on approximately 5-JUNE-2009, the pregnancy was terminated. The baby did not suffer from any congenital anomaly. Upon internal review, no heart beat for the fetus and termination of pregnancy-elective were considered to be important medical events. Causality for the elective termination (for the mother) and no heart beat (for the fetus) are unknown. No further information is available.

MedDRA PT Abortion spontaneous, Anaemia, Blood test, Condition aggravated, Drug exposure during pregnancy, Uterine dilation and curettage

Symptom Text: Information has been received from a 21 year old female patient with a history of previous miscarriage and anaemia who in February 2009, was vaccinated with the first dose of GARDASIL (lot# not available). There was no concomitant medication. The Health Department that administered the vaccine did a pregnancy test but it came back negative. The patient thinks she may have been about 2 weeks pregnant at the time of the injection. On 07-MAY-2009 the patient had a miscarriage and the physician also discovered she had an anemia. A blood test and "D & C" (unspecified) were performed (no results provided). The patient sought unspecified medical attention. Upon internal review miscarriage was considered to be another important medical event. No further information is available.

MedDRA PT Abnormal behaviour, Drooling, Dyskinesia, Hyperhidrosis, Incoherent, Partial seizures, Petit mal epilepsy, Posture abnormal, Speech disorder, Unresponsive to stimuli

Symptom Text: Information has been received from a physician concerning a 15 year old female with depression who in November 2007 was vaccinated with her first dose of GARDASIL intramuscular in her deltoid. Concomitant therapy included LEXAPRO. The patient was vaccinated with all three doses of GARDASIL (lot numbers not available) intramuscular into her deltoid. The patient received her first two doses of GARDASIL along with MENACTRA, Tdap (manufacturer unknown). Three or four months after receiving her third dose of GARDASIL intramuscular (in approximately August 2008 or September 2008), the patient experienced absent seizure. The child became non-reactive, non-responsive and distant. She did not received any other vaccines along with her third dose. She received an electroencephalography and an magnetic resonance imaging which were normal. The outcome of the patient was not reported. The patient was currently seeing a neurologist who felt that the seizure was caused by stress rather than from the vaccine. Upon internal review absent seizure was considered to be an other important medical event. Additional information has been requested. 10/19/09 Neurology consultation records received, service dates 4/7/09 to 10/5/09. Assessment: Partial epilepsy. Witnessed seizure with vocalization, elbow flexed, hand clenched, turned head to right side, incoherent. sweating and drooling.

Other Meds: LEXAPRO

Lab Data: Electroencephalography, normal; Magnetic resonance, normal

MedDRA PT Abnormal behaviour, Acne, Convulsion, Electroencephalogram abnormal, Fatigue, Immediate post-injection reaction, Loss of consciousness, Nuclear magnetic resonance imaging normal, Rash, Speech disorder

Symptom Text: My daughter had her first dose of Gardasil in October of 2007, then her second dose November of 2007, and her last dose April 2008. Right after (approxamatly 1 month) her 3rd dose she started having spells that she would black out and be mumbling to where nobody could understand her. She just thought she was day dreaming and so she did not inform us. In the first of September of 2008, patient had came home from school and was very tired. She went up to her room and laid down for about 1 hour. Then she came down stairs and sat on our fireplace step and started talking totally out of her head and we could not understand her. Our first reaction was she was doing drugs and we was going to take her to her Pediatrician. The following week at her softball practice she did it again in front of her coach and father. Her father called me and I immediately called her pediatrician and made an appointment the next day. Her pediatrician told us to take her to a child Neurologist. We got in the following week with her Neurologists and he initially thought that it was her anxiety causing it. He did an EEG and that came back negative and then he did an Mri and that came back negative. Dr. then decided that it was probably caused by her anxiety and sent us to a child Phsyciatrist to have her tested. Still at this time Dr. wasn't sure if these were seizures. We then went and saw the Phsyciatrist and he did some testing and figured out it was not her anxiety and thought her anxiety wasn't that bad. We then had an appointment the next couple of days with her Neurologist. While at the appointment patient went into a seizure in front of the Dr. I had been explaining to him that they have been getting worse. Instead of having them maybe once a week she was having them 2 to 3 times a week and sometimes 2 or 3 times a day. Dr. stated while she was in the seizure that she was definitely having a seizure and I told him that this was the first time I had seen her posture. Dr. had an EEG done immediately and it did come back that the left sid

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Convulsion, Dyskinesia, Fatigue, Hyperventilation, Influenza like illness, Muscle spasms, Muscular weakness, Syncope

Symptom Text: Information has been received from Health Authorities concerning a 17 year old female who was vaccinated with the 1st dose of GARDASIL in January 2008, the 2nd dose in April or May 2008 and the 3rd in August 2008. In January 2009, the patient presented with influenza-like episode during 15 days, with no fever. During a cross-country running at school, the patient collapsed at the end of the kilometer. It took her several hours to recover. One week later, still in January 2009, she experienced tetany seizures at the least effort, associated with hyperventilation, very intense muscle cramps and abnormal movements. The patient also had chronic fatigue and muscle weakness in January 2009. Complementary examination showed a negative blood work-up, a deficiency in erythrocytic magnesium and a negative infectious mononucleosis test. In March 2009, the patient experienced again a very severe tetany seizure which led to her hospitalization in neurology. The following work-up were normal: EEG, electromyography at test, CT scanner, muscle biopsy. However, lactate/pyruvate dosage, with or without garrot, was abnormal. Investigations were carried on concerning an enzymatic deficiency (results not provided). At the time of report, the patient had recovered from tetany seizure but not from chronic fatigue and muscle weakness. The Health Authorities assessed the causal relationship between the reported reactions and vaccinations as doubtful according to the foreign method of assessment. Other business partner numbers included E2009-05004. Additional information is not expected.

Other Meds: Unknown

Lab Data: diagnostic laboratory test, ??09, negative blood work-up; diagnostic laboratory test, ??09, Lactate/pyruvate dosage, with or without garrot, was abnormal; serum magnesium, ??09, deficiency in Erythrocytic magnesium; serum EPSTEIN-BARR virus

MedDRA PT Convulsion, Cyanosis, Gaze palsy, Muscle rigidity, Nystagmus, Tremor

Symptom Text: Seizure 3 hours post administration of HPV 1st seizure - no other risk factors. 7/9/09 Hospital ED records received DOS 6/15/09. Assessment: New onset seizure, possibly secondary to tramadol use. Relative reports that patient while on bus had an onset of shaking of upper extremities, right extremities in a 'frozen' kind of extension. Eyes rolled back, some saliva, lips turned blue. Patient woke up and was confused. Exam reveals only slight right lateral nystagmus. Medical Center and neurology referral and MRI suggested.

Other Meds: 7/9/09 Hospital ED records received DOS 6/15/09. Ultram

Lab Data: Went to ER. had CT scan & blood tests. 7/9/09 Hospital ED records received DOS 6/15/09. LABS and DIAGNOSTICS: CBC - HGB 11.8 g/dL (L) HCT 34.8% Neutrophil 67% (H) Lymphocyte 15% (L). Other labs and diagnostics WNL.

MedDRA PT Rash, Systemic lupus erythematosus

Symptom Text: This case was received from a physician on 18 June 2009. A 14-year-old female patient, with no reported medical history, received the following vaccinations on 26 March 2009: a first intramuscular right deltoid injection of MENACTRA (lot number U2580AA); a first intramuscular right deltoid injection of BOOSTRIX (GSK, lot number AC52B018BA); and an intramuscular left deltoid injection of GARDASIL (Merck, lot number 1312X). She was recovering from a cold at the time of vaccination. One month post-vaccination, the patient developed a rash on the left cheek. A few months later, she was diagnosed with Lupus. No additional information was reported. Additional documents held by sender: None.

MedDRA PT Condition aggravated, Rash, Systemic lupus erythematosus

Symptom Text: Information has been received from a physician concerning a 14 year old female patient who on 26-MAR-2009 was vaccinated with the first and only dose of GARDASIL (lot # 661846/1312X) IM 0.5 ml. Concomitant therapy included DTaP (manufacturer unknown), MENACTRA and ADACEL. Prior to the vaccination, the patient had a small rash on her nose. However, 4 weeks after the vaccination, the patient developed more rashes on her face. The patient was referred to a dermatologist and was diagnosed with lupus and given the treatments for lupus. The patient had not recovered at the time of reporting. Upon internal review, lupus was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Abortion induced, Antibody test, Blood grouping, Drug exposure during pregnancy, Full blood count, Laboratory test

Symptom Text: Information has been received from a certified medical assistant, for the pregnancy registry for GARDASIL, concerning a 20 year old female with a history of migraine who on 22-OCT-2007 was vaccinated with the first dose of GARDASIL. On 22-APR-2009 the patient received the second dose of GARDASIL, 0.5ml/IM. No other vaccines were administered at the time of either GARDASIL dose. On 08-JUN-2008 the patient had a pregnancy test done and the office found out that she was pregnant at the time of the second dose of GARDASIL. Other labs test performed were: CBC, ABO grouping, STD screen and antibody screen (results not reported). The patient's last menstrual cycle was the end of March 2009. The patient was scheduled for surgery to terminate her pregnancy on 17-JUN-2009 for personal reasons. On 18-JUN-2009 the certified medical assistant reported that the patient terminated her pregnancy on 17-JUN-2009 as scheduled. At the report time the outcome was unknown. Upon internal review termination of pregnancy was considered an Other Important Medical Events. Additional information has been requested.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Foetal disorder, Oblique presentation

Symptom Text: Information has been received through the Merck pregnancy registry from a physician concerning a 23 year old female who on 12-JUL-2007 was vaccinated with her first dose of GARDASIL (lot# 657736/0389U). On 10-SEP-2007 the patient was vaccinated with her second dose of GARDASIL (lot# 658558/1061U). On 10-JAN-2008 the patient was vaccinated with her third dose of GARDASIL (lot# 659653/1448U) and was pregnant. The patient was 6 weeks, 5 days. Concomitant therapy included prenatal vitamins. Lab tests performed included quantitative HCG, CBC, Progesterone, HIV, RPR, Rubella, RH type, ABO, antibody screen and sickle cell prep. The patient sought unspecified medical attention and her outcome was not reported. Follow up information was received from an assistant of physician which reported that they did not have pregnancy outcome information. Follow up information was received from a medical records manager at the OB office, for GARDASIL, a Pregnancy Registry product, concerning the patient who on 10-SEP-2008 (39.5 weeks from LMP) delivered a normal male infant (weighted 8 pounds, 15 ounces). The Apgar score were 8 and 9 respectively. The patient delivered by cesarean section with pre and post-operative diagnosis of oblique lie and suspected macrosomia. There were no complications in the pregnancy, and the patient had a normal glucose tolerance test. The patient recovered without complication as well, and the baby was fine at the postpartum visit. Upon internal review, oblique lie and suspected macrosomia were determined to be other important medical events as they resulted in a cesarean section. Additional information is not expected.

Other Meds: vitamins (unspecified)

Lab Data: complete blood cell; serum progesterone test; HIV antibody screen; Rapid plasma reagin; serum rubella IgG; serum gonadotropin-; erythrocyte ABO antigen; red blood cell antibody; hemoglobin S test; urine beta-human; Apgar score, 8/9; glucose

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Uterine dilation and curettage

Symptom Text: Information has been received from a 16 year old female consumer for the Pregnancy Registry for GARDASIL concerning herself who on 19-MAR-2008 was vaccinated with her first dose of GARDASIL (lot# not reported). On the same day the patient had a positive pregnancy test in the office. Her estimated LMP was 25-FEB-2008. She sought unspecified medical attention. Follow-up information received on 13-JAN-2009 from a woman from a doctor's office indicated that they did not follow up with the patient after she became pregnant. The reporter provided the OB/GYN practice information. Follow-up information was received from a person from the doctor's office indicating that the patient had a miscarriage in early pregnancy and had a dilation and curettage on 25-MAY-2008. It was also reported that the patient did not receive GARDASIL in their office. Upon internal review, miscarriage was determined to be an important medical event. Additional information has been requested.

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Convulsion, Fall, Grand mal convulsion

Symptom Text: Information has been received from a company representative concerning her neighbor's friend's daughter a 13 year old female patient who "earlier this week" on approximately 15-JUN-2009 was vaccinated with a dose of GARDASIL. The patient had two episodes of seizures starting 2 days after administration of GARDASIL on approximately 17-JUN-2009. The patient was currently in the hospital. The patient had not recovered. Additional information has been received from the field employee who provided the patient's name (date of birth, provider name and phone number unknown). The field employee reported while in the pediatrician's office and after the patient and received the second dose of GARDASIL, the patient fell on the floor and had a grand mal seizure. An ambulance took the patient from the physician's office to the hospital. The health care professional contacted during telephone follow-up could not supply the following information: date of birth, date of vaccination, dose number (if applicable), lot number (if applicable), date of event, hospital name (if applicable), healthcare provider name and contact information. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Asthenia, Cardiovascular evaluation, Guillain-Barre syndrome, Headache, Muscular weakness, Neurological examination, Pericardial effusion, Somnolence

Symptom Text: Case received from the Health Authority on 17-JUN-2009 under the reference number PEI 2009012220. The original reporting was done by an alternative healer (non-medical practitioner). It was reported that a 12-year-old female patient was vaccinated with a first dose of GARDASIL (lot # 1050U, batch # NH32130, IM, injection site not reported) on 09-JAN-2009. One day post vaccination the patient developed asthenia, headache and sleepiness which improved the following day. A few days later symptoms recurred and subsequently worsened. Pediatric, neurological and cardiac examinations were carried out and a mild pericardial effusion was diagnosed. Three weeks post vaccination the patient was very weak especially gait, posture and the left arm more than the right arm. GUILLAIN-BARRE syndrome was suspected. At the time of reporting to Health Authority on 25-FEB-2009 the patient had not recovered. Health Authority coded also myasthenia. GUILLAIN-BARRE syndrome, asthenia, headache, sleepiness and pericardial effusion were reported as other important medical event. Other business partner numbers include E2009-05040. No further information is available. File closed.

Seriousness: DIED, SERIOUS

MedDRA PT Asthma, Autopsy, Condition aggravated, Death

Symptom Text: Information has been received from a gynaecologist concerning an approximate 14 year old female patient with a history of bronchial asthma, who was vaccinated with a first dose of GARDASIL (lot # not reported) IM into the upper arm on 09-JUN-2009. On 12-JUN-2009, the patient experienced an asthmatic attack of which she died. The patient had no long-term medication for the asthma but only on occasion. Concomitant medication included hormonal contraceptives (unspecified). Reportedly, an autopsy was performed. The result is not yet known. A causal relation to the GARDASIL vaccine was considered unlikely by the vaccinating physician. Follow-up information received on 22-JUN-2009: Exact birth date, initials, height (158 cm) and weight (50 kg) as well as lot # 1477U, batch # NH25390 were provided. Following information gathered by phone from the reporting physician, the girl experienced the asthmatic attack at home and an emergency doctor was called. He was not able to arrest the attack and resuscitation was unsuccessful. Other business partner's numbers included: E2009-05085.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician for the pregnancy registry for GARDASIL concerning a 22 year old female with a history of papanicolaou smear abnormal and cervical dysplasia who on 05-AUG-2008 was vaccinated with a first dose of GARDASIL 0.5 ml IM in her left upper arm. Concomitant therapy included "FOUCACIO". On 02-SEP-2008 the patient went to the office and blood work was drawn. The patient was positive for pregnancy. No adverse event was reported. On 03-SEP-2008 the patient was 2 or 3 weeks gestation. The last menstrual period was approximately 12-AUG-2008. The estimated due date is 19-MAY-2009. Additional information has been received from a Pregnancy Registry memo. The patient underwent an elective termination of pregnancy prior to 20-OCT-2008 for reasons that are not related to the vaccine. Additional information has been requested.

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Anxiety, Lethargy, Nausea, Pallor, Syncope

Symptom Text: Information has been received from a Physician Assistant (P.A) concerning a 15 year old female patient who on 13-JUN-2009 was vaccinated with the first dose of GARDASIL (Lot # not reported). It was reported that the patient fainted right after receiving the first dose of GARDASIL on 13-JUN-2009. It was reported that the patient was was brought to the emergency room and stayed there for a few hours. The patient was not admitted to the hospital. The patient sought medical attention with the Physician Assistant. There was a blood work performed (results not provided). It was reported that the adverse event had improved at the time of the report. All telephone attempts to contact the reporter have been unsuccessful. Follow up information was received from a Physician Assistant (P.A) on 23-JUN-2009 via telephone reported that the patient with no pertinent medical history or known drug allergies was vaccinated with the first dose of GARDASIL (Lot # 661846/1312X) on 13-JUN-2009. On 13-JUN-2009 the patient was very anxious and hadn't eaten since the night before. There were no concomitant medications and no other vaccinations given that day. After having fainted for only a few seconds, the patient was monitored in the office for the next 45 minutes. The vital signs and blood sugars were normal, but the patient was nauseous, lethargic and pale. She was transported to the emergency room. It was unknown what tests - other than blood work - were performed. The event was considered disabling for about five hours. The patient had fully recovered. The reporter considered fainted, nauseous, lethargic and pale to be significant disability/disabling. No further information is available.

MedDRA PT Pruritus generalised, Vaccine positive rechallenge

Symptom Text: Information has been received from a nurse through the Health Authorities (reference number M200906-159) concerning a 14 years old female who experienced a general reaction or pruritus after receiving the first and second dose of GARDASIL (batch not reported). She received the first dose on an unspecified date. A few hours after vaccination, the patient had developed general pruritus which had begun in the joints of elbows, knees and spread throughout the body including genital area. The outcome was not reported. The patient received the second dose of GARDASIL (batch number not reported) via intramuscular route on 27-APR-2009 while she was in the emergency care service. Approximately 30 minutes later, she developed a similar reaction which was further exacerbated and which lasted two hours. She was given intravenous administration of an antihistamine (clemastine). To be noted that there was no history of previous adverse reactions to other drugs and that there was no suspicion of interaction. At the time of reporting, the patient had recovered. Other business partner number included: E2009-05145.

MedDRA PT Convulsion, Presyncope, Tonic clonic movements

Symptom Text: Case received from a physician on 18-JUN-2009 and transmitted through the foreign agency. A 17-year-old female patient received the first dose of GARDASIL (lot # 0779X, batch NJ32820) via intramuscular route on 12-JUN-2009. Approximately 5 to 10 minutes after vaccination, the patient experienced convulsion with tonic-clonic movements. The episode lasted around 1 minute, and the recovery was spontaneous and without sequelae. There was no loss of consciousness nor trismus. It was noteworthy that the physician reporter received the case from a nurse who mentioned that the convulsion have been epileptic. There was no known episode of fainting from blood collection or epilepsy. The physician reporter considered this case as non-serious. According to him, medically significant. Convulsion was considered to be other important medical event. Medically this was a vasovagal reaction and further dose would be administered to the patient under observation. To be noted that the case was also reported to the Health Authorities. Other business partner numbers include E2009-05164. No further information is available.

MedDRA PT Paraesthesia, Paralysis, Syncope

Symptom Text: Case received from the Health Authority on 17-JUN-2009 under the reference number PEI 2009012222. The case was linked with case E2009-5038 (same product, same reporter, same patient, different reactions). It was reported by a general practitioner that a female patient of unspecified age was vaccinated intramuscularly with a third dose of GARDASIL (lot #, injection site and date of vaccination not reported). Unspecified time post vaccination the patient experienced repeated syncopes. After second dose of GARDASIL the patient had already experienced palsy of the leg (E2009-05038; WAES # 0906USA04050). Palsy that was ongoing or recurring (not specified) was sometimes lasting for days. At the time of reporting (02-MAR-2009) the patient had been admitted to hospital five times by emergency doctor. Several investigations (unspecified) were carried out but didn't lead to any diagnosis. Toleration of first dose was not reported. After second vaccination with GARDASIL the patient experienced paraesthesia and palsy of her leg. At the time of reporting to Health Authority (02-MAR-2009) the patient had not recovered. Other business partner numbers include E2009-05052. No further information is available. File is closed.

MedDRA PT Convulsion, Presyncope, Tonic clonic movements

Symptom Text: Information has been received from a physician concerning a 17 year old female who on 12-JUN-2009 was vaccinated with her 1st dose of GARDASIL (lot#0779X, batch#NJ32820), IM. Approximately 5 to 10 minutes after vaccination, the patient experienced convulsion with tonic-clonic movements. The episode lasted around 1 minute, and the recovery was spontaneous and without sequelae. There was no loss of consciousness nor trismus. It was noteworthy that the physician reporter received the case from a nurse who mentioned that the convulsion could have been epileptic. There was no known episode of fainting from blood collection or epilepsy. The physician reporter considered this case as non-serious. According to him, this was a vasovagal reaction and further dose would be administered to the patient under observation. To be noted that the case was also reported to the Health Authorities. Upon internal review, the event of convulsion has been considered as an other medical important condition. Other business partner numbers included E2009-05164. No further information is available.

MedDRA PT Abasia, Antinuclear antibody, Arthralgia, DNA antibody, Immediate post-injection reaction, Joint swelling, Musculoskeletal pain, Rash generalised, Screaming, Systemic lupus erythematosus, Urine analysis, X-ray limb

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 13 year old female patient with no known pertinent medical history and no known preexisting illness and with periodic swelling of lip and eye was vaccinated with the third dose of GARDASIL (Lot # 660612/0229X) intramuscularly on 29-DEC-2008. There were no concomitant medications. Immediately following vaccine, the patient began to complain of mild symptoms (shoulder and wrist hurts and spots on her legs). On 05-JAN-2009, she came home from school with pain in both of her ankles but after resting and an ADVIL, she felt ok to go to school. She came home from school on 06-JAN-2009 screaming of pain her ankles were so swollen, we had a lot of trouble getting her boots off. She could not walk and had a rash all over her legs and ankles. We saw a pediatrician who immediately sent the patient to hospital. She had a lot of test included blood work of DNA, ANA, complement levels, urine analysis, and X-rays of ankles. Later did histone tests which indicated strong positive for drug induced lupus. Intravenous steroids and antibiotics were prescribed. They later diagnosed her with lupus. The listing indicated that one or more of the events was considered to be disabling, was considered to be immediately life-threatening. No further information is available. A standard lot check investigation was performed. All in-process quality checks for the lot number in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the Center and was released. The original reporting source was not provided. The VAERS ID # is 350284.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a healthcare professional through a Pregnancy Registry for GARDASIL concerning a 17 year old female with depression, attention deficit disorder, obsessive compulsive disorder and post-traumatic stress disorder who on 20-FEB-2008, 21-APR-2008 and 26-AUG-2008 was vaccinated with the first, second and third dose of GARDASIL, the second dose on 21-APR-2008 and third dose on 26-AUG-2008 (lot#s 659653/1448U, unidentifiable and 660620/0571X respectively). Concomitant therapies included ABILIFY, PROZAC and TRILEPTAL. The patient's last menstrual period was reported as 08-AUG-2009, EDD: 15-MAY-2009. Follow up information was received from nurse in physician's office via a phone call who reported the patient had a termination in November 2008. The patient was doing fine and there was no sequelae from the vaccination. Upon internal review, a termination (abortion) was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Dysaesthesia, Headache, Intracranial pressure increased, Myalgia, Nausea

Symptom Text: Information has been received from a physician concerning a 12 year old female who in January 2009, was vaccinated with GARDASIL. On 19-MAR-2009, the patient was vaccinated with the second dose of GARDASIL. In April the patient experienced headache, in May experienced nausea and continued with headache. On 08-JUN-2009 the patient was hospitalized, during the hospitalization lab exams were performed: clinical immunology test and magnetic resonance angiography of brain were normal. A spinal tap was performed, the diagnosis was Intracranial hypertension. On 13-JUN-2009 the patient experienced dysaesthesia and myalgia. Subsequently, on 14-JUN-2009 the patient recovered from headache and was discharged from the hospital on 16-JUN-2009 with the diagnosis of Intracranial hypertension. No more information about the hospitalization is available. The patient's dysaesthesia, nausea, myalgia and intracranial hypertension persisted. The reporter felt that dysaesthesia, myalgia and intracranial hypertension were not related to therapy with GARDASIL. Intracranial hypertension, dysaesthesia and myalgia were considered to be disabling. Additional information is expected.

MedDRA PT Convulsion, Gaze palsy, Muscle twitching, Nausea, Reaction to previous exposure to any vaccine, Syncope, Tremor

Symptom Text: Information has been received from a physician concerning an 18 year old female who on 18-JUN-2009 was vaccinated IM, 0.5 ml with the first dose of GARDASIL (lot # 661954/1131X). On 18-JUN-2009 after being given GARDASIL, the patient "fainted and had shaking episodes and seizure like reactions. She regained consciousness and the shaking and seizure like activity stopped, but then started again." The adverse effect "stopped and started over a 3 hour period before she was ready to leave." The mother said that the patient was "fine" by then, but also said that the patient had "similar reactions" to "other vaccines" in the past. The doctor did not specify which vaccines the patient had the reaction to. The patient sought unspecified medical attention. The patient had recovered on 18-JUN-2009. Additional information has been received from a medical assistant on 22-JUN-2009 who reported the patient had no pertinent medical history other than the fact that the patient had "similar reactions" to childhood vaccines (no specifics available). The patient had no known drug allergies (NKDA). Concomitant therapy included SOLODYN and unspecified oral contraceptive. No other vaccines were administered at that time. Seizure like symptoms included twitching and eye rolling. The patient also had mild nausea. Blood pressure (B/P) at start of incident was 90/60; later it was 118/60. The patient did not go to the emergency room (ER). Event not considered as life threatening. Upon internal review, it was determined that eye rolling/twitching (convulsion) were serious as an other important medical events. No further information is available.

MedDRA PT Condition aggravated, Enuresis, Presyncope, Schellong test, Syncope, Tonic clonic movements

Symptom Text: Information has been received from gynecologist concerning 17 year old female patient with a history of syncopes for instance when she suffers from nausea (She was able to describe these situations accurately). Also other members of her family have circulatory reactions the scope of low blood pressure and her mother had migraine. On 12-JUN-2008, the patient was vaccinated IM with a second dose of GARDASIL (lot number and injection site not reported). after vaccination the patient experienced a syncope with tonic-clonic movements and enuresis. In hospital letter it was written that she was reoriented after 20 seconds. on the reporting form duration was reported as five minutes. After putting her in another position symptoms improved. She was admitted to hospital (12-Jun-08 to 13-JUN-08). Physical examination and lab findings showed normal results. An EEG (electroencephalography) showed stable alpha EEG with slight increase of cerebral excitability. A single graphoelement was suspected to be a sharp slow wave. Hyperventilation showed generalized paroxysm that lasted for about 2 seconds (suspicious of spike slow wave) and after hyperventilation another generalized paroxysm was seen. Schellong test was normal. The hospital physicians came to the diagnosis of convulsive syncope in the scope of vasovagal reaction caused by vaccination. No anticonvulsive treatment was given. EEG controls were recommended. Concomitant medications included hormonal contraceptives (unspecified). The patient had recovered completely (unspecified date reported). Other business partner numbers include E2009-05066. File is closed. No further information is available.

Other Meds: hormonal contraceptives (unspecified)

Seriousness: ER VISIT, LIFE THREATENING, SERIOUS

MedDRA PT Dizziness, Dyspnoea, Headache, Nausea

Symptom Text: Information has been received from a healthcare student concerning a 19-year-old female patient who was vaccinated with the first dose of GARDASIL on an unspecified date. After receiving the vaccine the patient developed dizziness, nausea and difficulty breathing. The patient had sought office visit medical attention. At the time of the report, the patient's status was recovered. The patient's dizziness, nausea and difficulty breathing was considered to be life threatening. Additional information from a phone call to a nurse stated that the patient received the first dose of GARDASIL (Lot# 661953/1130X) on 20-APR-2009. There were no concomitant vaccinations given at that time. Approximately 30 minutes after the patient received the GARDASIL (Lot# 661953/1130X) vaccination she had dizziness and nausea. On 21-APR-2009, the patient had difficulty breathing and had a headache. The patient went to her PCP to sought medical attention, and was given BENADRYL (route not reported). The patient came to office on 22-JUN-2009 for the second GARDASIL vaccination. The N.P. stated that she did not administer the GARDASIL vaccination. The N.P. stated that she felt the patient's difficulty breathing was considered life-threatening. Additional information from a phone call to the patient's PCP doctor reported that on 22-APR-2009 the patient was seen by a P.A. The patient complained of having difficulty breathing. The P.A. did not think that the patient's difficulty breathing was related to the GARDASIL vaccination. The P.A. documented that she thought the difficulty breathing was "coincidental and was possibly due to a viral infection". The patient was prescribed a MEDROL (DOSE PACK). The P.A. documented that she wanted to speak with the patient's GYN physician before the patient received the second dose of GARDASIL. The patient had not been back to the doctor's office since 22-APR-2009. No further information is available.

MedDRA PT Clonus, Convulsion, Depressed level of consciousness, Dizziness, Epilepsy, Hypotonia, Loss of consciousness, Neurological examination normal, No reaction on previous exposure to drug, Petit mal epilepsy, Syncope, Trismus, Unresponsive to stimuli

Symptom Text: Information has been received from Health Authority on 24-APR-2009 under HA reference # PEI2009008420. It was reported that a 14 year old female patient was vaccinated with a second dose of GARDASIL (Batch # "NH21130" valid for PNEUMOVAX 23) (injection site not reported) intramuscularly on 16-JAN-2009. On 03-MAR-2009, the patient developed epileptic seizures with consciousness clouding, duration: 2 days (as documented). Under anticonvulsive treatment with ORFIRIL the symptoms stopped, but the patient had not recovered at the time of reporting (as documented). Dose one of GARDASIL (Lot # 3050U and Batch # NH32130) on 18-DEC-2008, intramuscularly was well tolerated. Follow up information was received on 18-JUN-2009. Two hospital reports were provided. The patient was hospitalized from 03-MAR-2009 until 18-MAR-2009. It was reported that the patient felt dizzy and collapsed in school on 03-MAR-2009. She had already been hospitalized for a similar event two years ago. The patient had no further medical history. The neurological investigation showed normal results. Lab parameters: c-ANCA and p-ANCA negative, infection serologies showed no evidence for an active infection with CMV, EBV, HSV 1 or 2, VZV, measles, rubella, coxsackievirus, mumps, echovirus, borrelia, toxoplasma, parovirus B19 or enterovirus. Liquor showed no pathologies. Repeated EEGs were normal. Routine laboratory findings were normal. The cranial computed tomography raised the suspicion of a 7 mm sized lesion of brainstem in medulla oblongata. No significant contrast agent absorption. Cranial MRI was normal. For the first time on 03-MAR-2009 the patient experienced epileptic like symptoms with unconsciousness, hypotonia, unresponsiveness to pain stimuli, Lockjaw and clonia of the right foot. Under treatment with LUMINAL and DIAZEPAM symptoms improved after about 45 minutes. The next day she experienced 3 further seizures. Due to the suspicion of atypical absences epilepsy treatment with VALPROAT was started and seizure episodes stopped. A psychiatrist s

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Sinusitis, Swelling face, Urticaria

Symptom Text: Chronic Hives...They were first noticed around mid January 2009. We first saw our pediatrician who thought it was viral. Then we went to see an Allergist who noticed she had a sinus infection. She has been on prednisone for facial swelling, Xyzal, Cingular, Benedryl, Zyrtec and 3 different antibiotics. She has had her blood drawn 4 times to see if there is anything serious like lupus or thyroid. Everything is fine. She has just had sinus surgery for her chronic sinus infection. We were hoping this was the case but her hives had been much worse since the surgery on June 24, 2009. My instincts have always told me it was a reaction to Gardasil. I have been hoping it was the sinus infection but it looks like it is not.

MedDRA PT Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a health professional for the Pregnancy Registry for GARDASIL, concerning a 16 year old female with no known medical history or drug reactions/allergies, who on 18-FEB-2008 was vaccinated (route unknown) with a first dose of GARDASIL (Lot # 659655/1486U). There was no concomitant medication. The nurse reports that on 18-FEB-2008 the patient's urine pregnancy test in the office was negative and she received her first dose. The patient returned to the office on 27-FEB-2008 for another urine pregnancy test and a Beta HCG (Human Chorionic Gonadotropin) blood test. Both were positive and showed she was 6 weeks pregnant (LMP 16-JAN-2008). No additional information at this time. The patient sought unspecified medical attention in the office. Outcome unknown. No product quality complaint was involved. Follow up information received on 23-JUN-2009 from a licensed practical nurse stated that the patient delivered at term, by cesarean section for macrosomia, confirmed by the baby's birth weight of 9 LBS, 4 oz. The nurse did not state whether the patient went into labor spontaneously, or was induced. Upon internal review cesarean section for macrosomia was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a consumer for the Pregnancy Registry for GARDASIL concerning her daughter a 14 year old female with no known medical history reported, who on 14-APR-2008 was vaccinated intramuscularly with a 0.5 mL first dose of GARDASIL (Lot # unknown). On the same day the patient was also vaccinated with a dose of VARIVAX (Lot # unknown) and VAQTA. The caller stated that her daughter received the three vaccines and discovered she was pregnant. At the time of the report the patient was 7 weeks gestation (LMP 12-MAR-2008). No AE reported. The patient had bloodwork and a pelvic exam performed. Outcome unknown. No product quality complaint was involved. Follow up information has been received from a physician, who reported that the 14 year old patient had a termination of her pregnancy soon after her pregnancy diagnosis (date not provided). The termination was not related to having had the GARDASIL vaccine. Upon internal review, termination of pregnancy was considered an other important medical event. No further information is available.

MedDRA PT Optic neuritis, Visual acuity reduced, Visual field defect

Symptom Text: Case reported by health authority (case n. 99935) (local case # IT248/09). Initial report received on 15-JUN-2009. This case is the linked case of a cluster of 2 cases after GARDASIL vaccination, reported by the same physician with the same lot number (0465U) batch number (NG17850). Case linked with case E2009-05042. A 15 year old female was vaccinated with the first dose of GARDASIL (lot number: 0465U, batch number: NG17850) on 10-MAR-2009. The patient referred that on 04-APR-2009, she noticed a difference between the vision of the right eye compared to the left. The ophthalmologist consultation showed reduction of visual field due to optic neuritis. At the time of reporting, the patient had not recovered and she was in therapy NOS with the ophthalmologist. The case was reported as not serious by both the reporter and HA and upgraded to serious by company according to internal rules. Optic neuritis was reported as an other important medical event. Case is closed. No further information is available. Other business partner numbers include E2009-05022.

MedDRA PT Abdominal pain upper, Condition aggravated, Dizziness, Fall, Hyperhidrosis, Injury, Joint injury, Malaise, No reaction on previous exposure to drug

Symptom Text: Information has been received from a general practitioner concerning a 14 year old female who on 14-APR-2009 was vaccinated with the first dose of GARDASIL (batch # not reported). She was in overweight, was in good health at the moment of vaccination and had already had a few episodes of mild malaises before vaccination. Furthermore, she had problems with the picture of her body in relationship with her age. On an unspecified onset of after vaccination, she presented with mild malaises. To be noted that the patient did not experienced any adverse event immediately after the vaccination. On 27-APR-2009 the patient fell off from a horse and presented with a trauma at the left shoulder. Ever since, she experienced recurrent episodes of malaises associated with stomach pain, sweating, but also sensation of fainting without loss of consciousness, without pain at chest and without neurological deficit. The events would occur when she was at home or at school. Clinical exam of cardiology revealed normal. Glycemia, creatinaemia, cholesterolemia, hepatic work-up, complete blood count, blood iongram, thyroidal work-up and iron work-up all revealed normal. Slight triglyceridemia at 1.52 (normal range inferior to 1.50). Cerebral MRI was normal. Results for Holter ECG and stress test were expected. To be noted that she had well tolerated her previous vaccinations and that there was no particular familial history. At the time of reporting, the outcome was not provided. Malaise and trauma were reported as other important medical events. Additional information has been requested. Other business partner numbers include E2009-05245.

MedDRA PT Convulsion, Immediate post-injection reaction

Symptom Text: Information has been received from a health care worker concerning a 15 year old female patient who on 12-JUN-2009 was vaccinated with the third dose of GARDASIL (Lot # 659054/0315Y). It was reported that on 12-JUN-2009 the patient experienced seizures, immediately following the administration. The patient sought medical attention in the physician's office. It was reported that the patient recovered the same day, 12-JUN-2009. Upon internal review seizures was considered to be another important medical event. Additional information has been requested.

Seriousness: ER VISIT, HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abdominal pain, Amnesia, Arthralgia, Asthenia, Brain scan normal, Burning sensation, Chest pain, Constipation, Disturbance in attention, Dizziness, Dysuria, Epstein-Barr virus infection, Fatigue, Fibromyalgia, Lyme disease, Migraine, Muscle spasms, Nausea, Pain in extremity, Pruritus, Rash generalised, Scan brain, Somnolence, Speech disorder, Tinnitus, Weight decreased

Symptom Text: Information has been received from a consumer concerning her 14 year old daughter with no medical history or drugs allergies, who on 22-OCT-2007 was vaccinated with a 0.5 mL dose of GARDASIL, intramuscularly. Concomitant therapy included fludrocortisone, ZOFRAN, an unspecified antibiotic, a patch for pain, doxycycline, zaleplon, VALIUM and VICODIN. Forty-eight hours after the vaccination the patient experienced pain in her legs. She also blacks and had dizziness, fatigue, migraines, body spasms, joint pain, weakness, memory loss, difficulty speaking and difficulty concentrating on things. She had loss about 30 pounds because of really bad nausea. When she stands up she gets a real loud ringing in her ears. She had abdominal pain and sensation of burning throughout her body. She had a rash all over her body and she was constantly itching. She gets chest pains. She was constipated and it was really hard for her to urinate. It was hard for her to stay awake. She had been to the emergency room more than 20 times. She was admitted to hospital 3 times. Therapy with GARDASIL was discontinued. All the laboratories tests (unspecified) performed to the patient have come back normal. At the time of this report the patient had not recovered. Follow up information received on 27-AUG-2009 from the physician's office supervisor indicated that the patient was vaccinated with a dose of GARDASIL (lot # 658563/1063U) IM on 22-OCT-2007. Concomitant vaccination given on 22-OCT-2007 included a dose of influenza virus vaccine (lot # U2486AA). The supervisor stated that the patient had not been seen in their office since October 2007. The reporter also indicated that the patient was referred to a rheumatologist. On 28-AUG-2009 information was received from a registered nurse from the office of a pediatric neurologist who reported the following highlights for the patient: the patient has many chronic conditions. She was last seen in their office on 14-APR-2008. Dates for the three hospitalizations were: 19-JUL-2008 to 29-JUL-2008; 10-OCT

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Crying, Ear pain, Fall, Head injury, Irritability, Nausea, Syncope, Vomiting

Symptom Text: Pt left clinic with mom approx 5 minutes after being seen in clinic ear pain at 2:30 pm and also received four immunizations including HPV (Gardasil), Tdap, Menactra and Varicella. While waiting for valet to bring vehicle, pt told mom she felt nauseous and then fainted and fell backward, hitting her head on the sidewalk. Pt came back to clinic and was upset and crying and had a knot on the upper back portion of her head. The nurse practioner seeing the pt was notified and an RN performed a neuro check which was wnl and ice pack was applied before sending pt to have skull films performed. Pt returned to clinic and was observed for another 30 minutes before releasing to go home with mom. At 2:00 am, mom called triage line because pt was vomiting. Pt was advised to go to ER and did so where a CT Scan was performed which mom reports was WNL so they were sent home.

MedDRA PT Abortion spontaneous, Drug administered at inappropriate site, Drug exposure during pregnancy

Symptom Text: Information has been received from a Certified Medical Assistant (C.M.A.), for the Pregnancy Registry for GARDASIL, concerning a 26 year old female who on 17-JUN-2008 was vaccinated intramuscularly with the first dose of GARDASIL (lot # 659962/1740U) in the left arm and on 22-SEP-2008 was vaccinated intramuscularly with the second dose of GARDASIL (lot # 660620/0571X) in the right hip. Concomitant therapy included hormonal contraceptives (unspecified). The patient became pregnant before the GARDASIL series had been completed. No adverse symptoms. It was reported that the last menstrual period (LMP) was 26-AUG-2008. Medical attention was sought via phone call. No product quality complaint was involved. Follow-up information was received from the nurse practitioner. The nurse reported that the patient had not received any concomitant vaccines when she received the first two doses of GARDASIL. The patient had not received the third dose of GARDASIL. The patient had a miscarriage sometime between August 2008 and December 2008. The patient had recovered from the miscarriage. The patient's last menstrual period (LMP) was also reported as 14-DEC-2008. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Agranulocytosis, Pyrexia, Thrombocytopenia

Symptom Text: Case received by the health authorities on 26-JUN-2009 under the reference number PS20090584 PS090584. A 22 year old female patient received the first and second dose of GARDASIL 0.5 ml by the intramuscular route respectively on 07-AUG-2008 and 09-SEP-2008 (also reported as 07-SEP-2008). On 17-SEP-2008 she was hospitalized due to a fever associated with agranulocytosis objectivized by the result of a blood count and differential white count. In early September 2008, the patient had taken POLERY per os, DI-ANTALVIC. Dosages and duration were unspecified. Work up performed on 17-AUG-2008 showed leukocytes at 2933 with neutrophils at 29/mm3, and platelets at 137000/mm3. Myelogram revealed an agranulocytosis with blockage of the granular maturation at the promyelocyte level, with no presence of abnormal cells. Virological work up was performed. Results were expected for the following serologies: cytomegalovirus, Epstein Barr virus, HIV, hepatitis B virus, hepatitis C virus, parvovirus B19, HHV6. Infectious mononucleosis serology was negative. The patient was given broad-spectrum antibiotics with TAZOCILLINE and genta. Evolution was marked by an apyrexia and by the increase of leukocytes, neutrophils and platelets rates. Blood count and differential white count on 22-SEP-2008 showed neutrophils at 2830/mm3 and platelets at 254000/mm3. The name of amoxicillin's specialty was not known. To be noted that thrombocytopenia was also coded by the health authorities. At the time of reporting, the patient had recovered. The health authorities assessed the causal relationship between the reported reactions and vaccination as "doubtful" (C2 S1 I1) according to the foreign method of assessment. No further information expected. Other business partner numbers include: E2009-05363.

Other Meds: POLERY ADULTES

Lab Data: bone marrow myelogram, 17Aug08, agranulocytosis with blockage of the granular maturation at the promyelocyte level, with no presence; WBC count, 17Aug08, 2933 /mm3; cytomegalovirus antigen, 17Aug08, results expected; neutrophil count, 17Aug

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Asthenia, Dizziness, Dysphagia, Face oedema, Hypersensitivity, Lymphadenopathy, Oedema, Paraesthesia, Paraesthesia oral, Pruritus, Rash, Sensory loss, Swelling, Swelling face

Symptom Text: Information has been received from a health professional (a nurse, the patient's mother) concerning a 22 year old female with a history of infectious mononucleosis who on 15-MAR-2009 was vaccinated with GARDASIL first dose. On 01-JUN-2009 the patient was vaccinated with GARDASIL second dose. There was no concomitant medication. On 01-JUN-2009. 6-7 hours post vaccination, the patient experienced weakness, tingling in lips of the injection side, tingling in face of the injection side, tingling in arm of the injection side and loss of feeling in body on the injection side. On 02-JUN-2009 the patient experienced edema and swelling starting at the face and then in the whole body, dizziness and allergic reaction was suspected. The patient was placed on therapy with anti-histamines which was not helpful. The patient experienced dizziness and weakness. On 04-JUN-2009 the patient experienced rash which was first palpable and then visual. The swelling decreased due to therapy with anti-histamines. On approximately 04-JUN-2009, approximately 3-4 days post vaccination, the patient experienced itchiness in arms and legs, swollen and sensitive neck lymph nodes, swallowing difficulty due to the swollen neck lymph nodes. The patient was placed on therapy with Steroids IV. Therapy was not helpful and at this stage the patient was referred to the emergency room. The patient was hospitalized for 3 days. During hospitalization the patient experienced loss of feeling in lips and tongue, itchiness, leukocytes increased and EBV antibodies increased. The patient was placed on therapy with PREDNISONE IV. Subsequently, the patient was released from hospitalization and recovered from tingling in lips of the injection side, tingling in face of the injection side, tingling in arm of the injection side and loss of feeling in body on the injection side, edema and swelling starting at the face and then in the whole body, allergic reaction, rash, itchiness in arms and legs, swollen neck lymph nodes, swallowing difficulty, loss of feeling in lips

MedDRA PT Asthenopia, Blindness, Demyelination, Eye pain, Multiple sclerosis, Optic neuritis, Vision blurred

Symptom Text: The patient received gardisil #1, Tdap and meningococcal conjugate vaccine (ACYW-135) on 01June 2009 -- administered at Pediatrics in facility. On 23June she started having painful and blurred vision in the right eye, she was evaluated by us in the Pediatric Neurology clinic on 26June and found to have right optic neuritis. Brain MRI showed periventricular white matter hyperintensities, one with enhancement. She was admitted for IV steroids. The DDx includes multiple sclerosis vs demyeliation triggered by the immunizations. 7/14/09 MR received for DOS 6/26-28/2009 with D/C DX: Optic Neuritis (R retrobulbar). Pt admitted for IV steroids for 4 day hx of blurry vision, vision loss, eye muscle strain and pain. Neuro consult c/w ON. Will continue to watch for further signs of MS. Tx with IV steroids and d/c on steroid taper.

Other Meds: none

Lab Data: Brain MRI showed periventricular white matter hyperintensities, one with enhancement. Visual acuity in the right eye- 20/60. Labs and Diagnostics: MRI brain (+) demyelinatin lesions suspicious for MS. Visual acuity 20/60 on R, 20/20

History: eczema. PMH: biliary atresia with Kasai procedure, oral surgery

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abdominal pain, Abortion induced, Drug exposure during pregnancy, Intra-uterine death, Uterine dilation and curettage

Symptom Text: Information has been received from a 23 years old female for the Pregnancy Registry for GARDASIL who on 16-MAY-2008 was vaccinated intramuscularly with her first dose GARDASIL and found out three days later that she was pregnant. The patient's estimated LMP was 20-APR-2008 and she had a positive pregnancy test. Subsequently the patient experienced no adverse event symptoms and sought unspecified medical attention on an unspecified date by calling the office. Follow up information has been received from the patient who stated that she did get the GARDASIL last year but at 10 weeks in her pregnancy she had a miscarriage. At the time of her receiving the first dose of GARDASIL, she had a negative pregnancy test at the office. After one to two weeks, she performed a home pregnancy test which was positive. She called the physician's office to report it as she was concerned. On her initial prenatal visit, her physical exam was completely normal, and an ultrasound was not routinely done. When she sent to have an ultrasound at the office at 10 weeks, it was found there was no fetal heartbeat. She was asymptomatic. She stated the doctor told her it looked like the fetus had stopped developing about a week or two before that. After the ultrasound, she had some abdominal cramping type pain, but did not spontaneously pass the pregnancy. She "ended up needing a D&C". That went OK, she said, and at her 2 week checkup "everything was fine". Upon internal review, the intra-uterine death and abortion induced were considered as Other Important Medical Events. Additional information has been requested.

MedDRA PT Breech presentation, Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse through the Merck Pregnancy Registry concerning a 16 year old female patient who on 28-MAR-2008 was vaccinated with the first dose of GARDASIL. On 22-MAY-2008 the patient was vaccinated with the second dose of GARDASIL. There was no concomitant medication. The patient was pregnant. The patient has not experienced any know symptoms. The patient sought medical attention seen by the physician. Follow-up information was received from a health professional. The patient delivered on 05-DEC-2008 via C-section due to breech presentation. The baby was 6 lb 5 oz and completely normal and healthy with no congenital anomalies. Upon internal review, C-section due to breech presentation were determined to be an other important medical event. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Drug exposure during pregnancy, Neonatal disorder, Poor weight gain neonatal, Premature labour

Symptom Text: Initial and follow-up information has been received from a Nurse Practitioner for the pregnancy registry for GARDASIL From a nurse practitioner concerning a 16 year old female patient with a history of no previous pregnancies who on 18-AUG-2008 was vaccinated with a 0.5 mL second dose of GARDASIL (LOT # 659964/1878U) while she was pregnant. The estimated conception date is 01-JUL-2008 and the estimated delivery date is 24-MAR-2009. The nurse reported that on 18-JUN-2008 the patient received a 0.5 mL first dose of GARDASIL (LOT # 659653/1448U). A healthcare worker in the Nurse Practitioner's office reported that the patient had no prenatal care until she was 5 months along. She delivered her baby 2 months premature. The baby had reflux issues and slow weight gain. Her neurological status was within normal limits. She did confirm that there were no congenital anomalies and the baby was, otherwise, normal. Upon internal review, premature was determined to be an other important medical event. No further information is available.

MedDRA PT Convulsion, Hypotonia, Loss of consciousness, Presyncope

Symptom Text: Information has been received from Health Authority (HA, reference number ES-AGEMED-118812447) concerning a 12 year old female who on 20-MAY-2009 was vaccinated with GARDASIL by intramuscular route (site of administration not reported). It was reported after vaccine administration the patient presented loss of consciousness and convulsion of short duration, and sphincter relaxation. The patient recovered from loss of consciousness shortly after. HA have coded vasovagal reaction, convulsion and loss of consciousness. According to the report, patient recovered from vasovagal reaction, convulsion and loss of consciousness on 20-MAY-2009. Outcome of sphincter relaxation has not been reported. No further information reported. Case reported as serious by Health Authority with other important condition as criteria. Case is closed. Other business partner numbers included E2009-05161. No further information is available.

MedDRA PT Activities of daily living impaired, Hemiparesis, Pain, Paraesthesia

Symptom Text: Information has been received from a physician concerning a 22 year old female with no pertinent medical history who on 06-APR-2009 was vaccinated with the first dose of GARDASIL (lot # 661953/1130X) and on 09-JUN-2009 received a second dose of GARDASIL (lot # 662404/0312Y) in her left arm. Concomitant therapy included birth control (unspecified). There were no concomitant vaccinations administered with the GARDASIL. On 13-JUN-2009, the patient had motor weakness. She started experienced tingling on her face, left arm, hand, leg and foot. It then progressed to pain and tingling on the entire left side of her body. The patient is left handed. The patient was able to work. The physician reported that the patient was seen by a neurologist who did a magnetic resonance imaging and a magnetic resonance angiography on the patient and the results came back normal. The physician indicated that the patient had not recovered, and the patient had been monitored every day and she could not go on vacation. The patient sought medical attention with her physician. Follow up call information from the neurologist indicated that the patient had left-sided weakness. The patient's magnetic resonance imaging and magnetic resonance angiography were normal. The neurologist stated that as of 29-JUN-2009, there was no definitive diagnosis. The patient would have a repeat magnetic resonance imaging for the next week. Upon internal review, left-sided weakness was determined to be an other important medical event. Additional information has been requested. ```Neurology consult records received 3/4/2010. Service date 7/9/09. Imaging studies only. Assessment: Suggestive of demyelinating disorder.

Other Meds: Unknown

Lab Data: Magnetic resonance, normal; Vascular imaging, normal. ```LABS and DIAGNOSTICS: MRI Cervical Spine - Abnormal. MRI Brain w/wo Gadolinium - Abnormal.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Hypoaesthesia, Inflammation, Sensory loss

Symptom Text: I received my second dose of the gardasil (HPV) vaccine on 6/9/09. Six days later I woke up and my left arm was numb. The loss of sensation persisted, and three days after that the entire left side of my body (face, neck, chest, torso, arm, leg, hand) lost sensation. I began to have a shock sensation when I put my head down to my chest. I saw a neurologist who sent me to the emergency room for x-rays. It turned out that my cervical spine was inflamed. It is now two months later, and I am finally starting to get sensation back on the left side of my body. I was 100% healthy before going in for this vaccine.

Other Meds: Yaz

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Contraception, Convulsion

Symptom Text: Information has been received from a physician assistant concerning a 15 year old female who on an unspecified date was vaccinated with the first 0.5ml dose of GARDASIL (IM, lot number unspecified). Originally the patient's pediatrician sent the patient to the physician assistant to have DEPO-PROVERA inserted (on an unspecified date). The patient went back to her pediatrician (on an unspecified date) and received the first dose of GARDASIL. The GARDASIL vaccine and DEPO-PROVERA administration were started "around the same time". It is reported that the information for DEPO-PROVERA stated that seizures had been associated with it. Approximately 4 weeks after administration she developed seizures. An electroencephalography (EEG) was performed and the technician performing the test asked the patient's mother if the patient have had a head injury so the physician assistant thought there might have been some "activity" showing up (not further specified). The patient had not received any further doses of GARDASIL and the DEPO-PROVERA had been removed. At the time of the report, the patient's status was unknown. Upon internal review, seizures was determined to be an other important medical event. All telephone attempts to obtain follow-up information have been unsuccessful. Additional information has been requested.

Seriousness: ER VISIT, HOSPITALIZED, LIFE THREATENING, PERMANENT DISABILITY, SERIOUS

MedDRA PT Colectomy total, Colitis ulcerative, Condition aggravated, Inappropriate schedule of drug administration, Surgery

Symptom Text: Information has been received from a physician and her office manager concerning a 19 years old female with no drug reactions and a history of anemia and ulcerative colitis which began at age 17 years who in July 2007, was vaccinated with the first dose of GARDASIL. In July 2008, the patient had a Total Colectomy and was hospitalized. In October 2008, the patient had J-Pouch surgery and on 05-JAN-2009, had "reversal" surgery. On 25-JUN-2009 (also reported as April 2008), the patient was seen in physician's office and received the second dose of GARDASIL (lot # 660616/0570X). At the time of reporting, the patient had recovered. Total Colectomy, J-Pouch surgery and "reversal" surgery were considered to be other important medical events, disabling and life-threatening. Follow up telephone call was made to the physician, and was transferred to the Office Manager. The Office Manager was not able to confirm that the patient's surgeries (Total Colectomy, J-Pouch surgery and reversal surgery) were related to a worsening of ulcerative colitis. Additional information has been requested. 7/7/09 Spoke with mother-emphatically denied that symptoms were related to HPV4, patient has a long history of colitis and does not want any follow-up on this report.

MedDRA PT Amnesia, Bite, Computerised tomogram normal, Convulsion, Face injury, Grand mal convulsion, Loss of consciousness, Malaise, Nausea, Tetany, Vaccine positive rechallenge, Vomiting

Symptom Text: Case received from a general practitioner on 25-JUN-2009 and transmitted through a sales representative. A 16 year old female patient with no post-vaccinal or epilepsy history neither for her or her family received the first dose of GARDASIL (lot # 1526U, batch # NH38010) via intramuscular route in the deltoid on 09-OCT-2008. One month after vaccination, during a familial party (without sound and lights) the patient lay dawn and had a true loss of consciousness during 15 minutes. She also bit her cheeks. When she woke up, she did not remember the evening nor the malaise. There was no loss of urine. At the emergency care department, tetany crisis was diagnosed. Head computed axial tomography scanner was normal. As no electroencephalogram was performed, the diagnosis was incorrect according to the reporter. She received the second dose of GARDASIL (lot # 1883U, batch # NH50490) via intramuscular route in the deltoid on 04-DEC-2008. On 26-DEC-2008, i.e. after Christmas eve, 22 days after vaccination, at approximately 2:00 am, the patient woke up as she was feeling unwell. She presented with nausea and vomiting. She took a shower and experienced a malaise with loss of consciousness and convulsive crisis. There was no loss urine. Electroencephalogram was performed on 30-DEC-2008. First diagnosis was juvenile myoclonic epilepsy. But eventually final diagnosis was idiopathic generalized epilepsy. The third dose was not administered. The patient was given KEPPRA but badly tolerated it. The treatment was changed to LAMICTAL, which was ongoing at the time of reporting. There was no new crisis since the one experienced in December 2008. Electroencephalogram was regulatory performed. At the time of reporting, the outcome was not specified. Generalized convulsive epilepsy and feeling unwell were considered to be other important medical event. Other business partner numbers include E2009-05417. No further information is available.

MedDRA PT Dysstasia, Fatigue, Infective myositis, Influenza like illness, Myalgia, Sensation of heaviness

Symptom Text: Case received from a general practitioner on 24-JUN-2009: A 17-year old female patient who had received the first dose of GARDASIL (lot # and batch #) on 14-APR-2008 received and the second dose of GARDASIL (lot # and batch #) on unspecified date in February 2009. One month after vaccination, she presented with muscle pain, fatigue, heaviness in the legs and she could not stand up anymore once seated. She was hospitalized approximately on 20-MAR-2009. Creatine Kinase was at 32000 and C-Reactive Protein at 43. Infective myositis was diagnosed as the patient had also experienced influenza-like syndrome a few days before these events. At the time of reporting, the patient was doing better but creatine kinase was still high (value not reported). No serology was performed. The performing of muscular biopsy was under discussion. The outcome was not specified. Other business partner numbers include E2009-05430. No further information is available.

MedDRA PT Abdominal pain, Haemorrhagic cyst, Ovarian disorder, Pelvic pain

Symptom Text: Information has been received from a gynaecologist concerning a 15 year old female with irregular menstrual cycle who was virgin and who did not take any contraception who was vaccinated with second dose of GARDASIL (batch number not reported) on an unspecified date. 48 hours after vaccination, the patient presented to the Emergency Unit Care. The reporter did not know whether she was kept at the hospital for the night. An ultrasound revealed a mild ovarian dystrophia. The gynaecologist had a doubt regarding the hemorrhagic cyst. To be noted that the painful syndrome had started during her menstrual cycle. The patient had already experienced abdominopelvic pain 48 hours after receiving the first dose of GARDASIL (date unspecified). She was given analgesics and SPASFON as corrective treatment. At the time of reporting, the patient had recovered from abdominopelvic pain but the final outcome was not provided. Other business partner numbers included: E2009-5441. Additional information has been requested.

MedDRA PT Nausea, Similar reaction on previous exposure to drug, Syncope

Symptom Text: Report received from a nurse on 16-APR-2009. A female patient aged in her 20's (Initials: unknown, Date of Birth: unknown) received FLUVAX and GARDASIL on 16-APR-2009. Batch numbers are unknown. The patient has a relevant medical history of nausea and fainting with previous vaccine administrations. It is unknown whether the patient was taking any concomitant medications. On 16-APR-2009 after both FLUVAX and GARDASIL were administered, the patient developed fainting and nausea. The patient had to lie down for approximately 1 hour. The patient recovered after 1 hour and after eating something. No other treatment was administered. The reporter considered events as non-serious and unlikely related to the administration of FLUVAX and GARDASIL. The company considered event causality as unassessable in relation to the administration of FLUVAX as it is unknown whether the patient was taking concomitant medication and it is known that GARDASIL was administered on the same day. Information derived from this AE does not change the current safety profile of the product.

Symptom Text: Information has been received from a 24 year old female, for the Pregnancy Registry for GARDASIL, concerning the 24 year old female who in December 2007, was vaccinated intramuscularly with the first dose of GARDASIL and in June 2008, was vaccinated intramuscularly with the third 0.5 ml dose of GARDASIL. There was no concomitant medication. The patient was two weeks pregnant while receiving the third dose of GARDASIL. The pregnancy test was positive. Unspecified medical attention was sought. Follow-up information on 01-JUL-2009 was received from an other healthy professional who reported that the patient with a history of 1 pregnancy and 1 live birth was vaccinated intramuscularly with the first dose of GARDASIL on 03-DEC-2007, on 04-FEB-2008, was vaccinated intramuscularly with the second dose of GARDASIL vaccine (lot # 655327/1287U) and on 04-JUN-2008, was vaccinated intramuscularly with the third dose of GARDASIL (lot # 655604/0052X). On 23-SEP-2008, ultrasound was performed with normal result. On 15-OCT-2008, maternal serum alpha-fetoprotein (MSAFP) was performed with negative result. On 13-FEB-2009 (Weeks from LMP: 39), the patient delivered a male infant with congenital anomaly cleft palate, weight: 8 lbs 3 oz and Apgar score 8/9. As of 01-JUL-2009, the outcome of cleft palate was unknown. Additional information has been requested.

Other Meds: None

Lab Data: ultrasound, 09/23/08, normal, routine anatomy scan; beta-human chorionic, positive; serum alpha-fetoprotein, 10/15/08, negative; Apgar score, 02/13/09, 8/9

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Cough, Eye oedema, Eye swelling, Inappropriate schedule of drug administration, Malaise, Nausea, Vaccine positive rechallenge, Wheezing

Symptom Text: Initial information has been received from a physician concerning a 14 year old female patient who received the second dose of GARDASIL and experienced "swelling and edema of the eye" and saw treatment at ER where she was given BENADRYL. The physician stated that she had the same experience after the first dose. The patient was due for her third dose in about a week and she was planning on receiving it. The swelling resolved after about a week, the patient had recovered. Follow up information has been received from a registered nurse concerning the 15 year old (initial reported as 14 year old) female patient who on 04-SEP-2008 was vaccinated with the first dose of GARDASIL (Lot # 0250X) and concomitantly received the second dose of HAVRIX (Lot # AHAVB264A). On 02-JAN-2009, the patient received the second dose of GARDASIL (lot# 0947X). On 24-Jun-2009, the patient was seen by the physician with complaints of a cough and wheezing. At the time of the physician's visit the patient's father stated that after the patient had received the first dose of GARDASIL, the patient was ill and nauseous and missed 1 week of school. The patient also had swelling and edema of both eyes. After the patient received the second dose of GARDASIL, the patient had swelling and edema of both eyes. The patient went to the Emergency Room and was treated with BENADRYL (route unknown to the reporter). The patient was not admitted to the hospital. The registered nurse stated that the patient was scheduled to receive the third dose of GARDASIL on 29-JUN-2009. The registered nurse requested to speak with a Merck physician prior to administering the third dose of GARDASIL to the patient. Follow up information has been received from a memo indicated that a Merck physician had spoken to the registered nurse. They have decided to not administer the third dose on 29-JUN-2009. Missing 1 week of school was considered to be disabling by the physician. Additional information has been requested.

MedDRA PT Cervix carcinoma

Symptom Text: Information has been received from a female patient who on an unknown date was vaccinated with GARDASIL. "15 months from the completion of the GARDASIL vaccination" the patient had full blown cervical cancer. The patient's oncologist would like to do a hysterectomy at this time, but the patient stated that she always wanted children. The patient had chosen to wait. The patient stated that she had two of the strains that the shot was supposed to prevent. At the time of reporting the patient had cervical cancer. The outcome of the patient's cervical cancer was not reported. Upon internal review the patient's cervical cancer was considered to be other important medical event. Additional information has been requested.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Hypertension

Symptom Text: Information has been received from a licensed practical nurse, for GARDASIL, a pregnancy registry product, concerning a 24 years old female patient with no medical history and no allergies who on 09-APR-2007 was vaccinated IM with the first 0.5ml dose of GARDASIL (lot # 657005/0314U). The patient received IM the second 0.5ml dose of GARDASIL on 04-JUN-2007 (lot # 657002/0337U, which belongs to VARIVAX). There was no concomitant medication. On 29-JUN-2009, the patient received the third dose of GARDASIL (lot # 661841/0653x). The patient did not receive any concomitant vaccinations when the three doses of GARDASIL were administered. After the patient was administered her second dose of GARDASIL she was determined to be pregnant. The patient required an unscheduled c-section on 18-MAR-2008 due to hypertension. The infant was a normal, full term baby with no complications. At the time of this report, the patient had recovered. It was reported that the patient sought unspecified medical attention. Upon internal review, the unscheduled c-section due to hypertension was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Arthralgia, Chest pain, Costochondritis, Dyspnoea, Hyperventilation, Musculoskeletal pain, Oedema peripheral, Syncope, Tremor

Symptom Text: Information has been received from a health authority under reference 2009-02416 concerning a 15 year old female adolescent who received on 19-MAR-2009 one intramuscular dose of GARDASIL (batch # and site of administration not reported). After 30 minutes swelled the hand of the injected arm. After another hour the swelling was decreasing again and formed back. On the 20-MAR-2009, she developed chest pain substernal, dyspnea and syncope. After a few of hours, she recovered. In April 2009, occurred articular and musculoskeletal pains and irregular trembling of the left leg and right arm. In the end of May, the patient reported a slow improvement in these adverse events. In the meantime, investigations carried out revealed a diffuse pressure the long joints and the muscle without clinical arthritis signs. The neurological complaints seemingly not correlate with an objective pathology. In the neurological examination, the suspects asked a TIETZES syndrome with intermittent hyperventilation-related breathing disorder as a timer for circulatory collapse and sterno thoracic pain. On 18-MAY-2009 a borrelienserology was negative for IgM and IgG after questionable findings on 21-APR-2009 was positive. Upper limb oedema, arthralgia, chest pain substernal, dyspnea, musculoskeletal pain, syncope and tremor were considered other important medical events per physician. Other business partner number included: E2009-05237. Additional information has been requested.

MedDRA PT Anxiety, Burning sensation, Dementia, Grunting, Hallucination, Heart rate increased, Hyperhidrosis, Hyperventilation, Insomnia, Panic attack, Tic, Weight decreased

Symptom Text: Information has been received from a physician concerning a female patient with asthma who on an unknown date, was vaccinated with the first dose of GARDASIL. Concomitant therapy included MAXAIR. A couple of days later after receiving GARDASIL, the patient started presenting with anxiety, dementia, panic attacks, loss of sleep, weight loss, hallucinations and hyperventilation. The patient was put on antidepressants (unspecified) and her symptoms got worse and she was taken to the ER on 02-FEB-2009. After the antidepressants the patient experienced burning, sweating, tics, rapid heart beat and vocal grunt and was admitted to the psychiatric hospital. The patient will not receive further doses of GARDASIL. The patient was released since she was feeling a little better and started eating, however she is showing early signs of dementia. The patient's adverse experiences were considered to be disabling. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Convulsion, Impaired driving ability, Injection site erythema, Injection site pain

Symptom Text: My daughter was encouraged to have the Vaccination GARDASIL at our local doctors surgery. She had the first injection, with no side effects, after the second injection, she suffered a terrible seizure. She has been investigated for epilepsy, with a neurologist, but no results could confirm this, we are left confused and unsure of her future. I am convinced that the GARDASIL caused her seizure. We were given no information regarding possible side effects, only that she may have a sore or red arm from the injection, she had a previous history of ITP, which is on her doctors records, but we were asked no previous medical history prior to the nurse giving the injection. I am absolutely disgusted that we were given no information. There is no history of epilepsy in our families, and my daughter was a healthy, fit 19 year old. She has has now lost her driving licence, the possibility of promotion at work, due to no licence, and we have been through hell and back with the worry of all this. How can this happen, someone needs to be accountable for this, this is just not fair. She is not in a relationship, she is not sexually active, so why is this drug being pushed towards young girls, with no thought for necessity, and no time investigating if it is really required for each individual. We have no idea what the long term effects are, I am worried sick that she may have another seizure, and who will be there for her if and when that happens, we are still going through hell with the worry, and I will do whatever it takes to get to the bottom of this.

Other Meds:

Lab Data: Pt was taken to the Hospital the day of the seizure, 26th April 2009, and she was given an ECG and a CT Scan. We have since had 3 EEG's with the Neurologist, and nothing can be found for the cause of the seizure.

History: Pt lived most of her life in the foreign country, just returned to country on a permanent basis with myself, and her father. She suffered with ITP between the ages of 9yrs to 12yrs old, but has had no symptoms in the last 7 years. She is a social smoker, 10 - 15 cigarettes a day, and a social drinker, 1 - 2 days a week, average 4-6 drinks. She has had no other medical conditions.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Asthenia, Diplegia, Disturbance in attention, Headache, Syncope, Tremor

Symptom Text: Information has been received from a physician via agency as part of a business agreement (manufacturer control # 20090701JZ3) concerning an approximately 24 year old female who on 28-FEB-2009 was vaccinated with the third dose of GARDASIL (lot# not reported). It was reported that post second dose of GARDASIL (lot# and date not reported), the patient experienced extreme headaches at the base of the neck, for which she saw a chiropractor. On 05-MAR-2009 the patient collapsed at work and was taken by ambulance to the hospital. The following morning (on 06-MAR-2009), a magnetic resonance imaging (MRI) and computed axial tomography (CAT) scan were performed which showed normal results. The patient's blood tests revealed a low white cell count. The patient had paralysis of her left leg and felt weak and was unable to concentrate. The patient described it as she felt as though she was "trembling from the immediate". Prior to returning to work, on 09-MAR-2009, 10-MAR-2009 and 11-MAR-2009 the patient received acupuncture, which was said to have improved her paralysis. Upon returning to work, the patient collapsed again at work on 18-MAR-2009 and was taken to another hospital. Another MRI was performed, which was also normal. The patient returned to work again on 30-MAR-2009, and found she was weak and unable to concentrate. During this time, the patient also visited a homeopath, who prescribed an "antidote" to GARDASIL without effect. Subsequently, the patient recovered. The outcome of the extreme headache at the base of the neck was unknown. Upon internal review, paralysis of left leg was considered to be an other important medical event. Additional information has been requested.

Other Meds: Unknown

Lab Data: magnetic resonance imaging, 06Mar09, normal result; computed axial tomography, 06Mar09, normal result; diagnostic laboratory test, 06Mar09, blood tests revealed a low white cell count; magnetic resonance imaging, 18?Mar09, normal

MedDRA PT Eating disorder, Headache, Meningitis, Musculoskeletal stiffness, Paraesthesia, Paralysis, Photophobia, Pyrexia, Speech disorder, Viral infection, Vomiting

Symptom Text: Information has been received from a physician via agency as part of a business agreement (manufacturer control # 20090701JZ2) concerning an approximately 20 year old female who was vaccinated with three doses of GARDASIL vaccine at 0, 2 and 6 months respectively. It was reported that the patient was taking an antidepressant medication for 3 months prior to her first dose of GARDASIL. 3 weeks post third GARDASIL, the patient experienced vomiting, fever, headache and pins and needles in her hands and feet. On the same day, the patient visited her doctor who diagnosed it as a viral infection. An hour after returning home from the medical clinic, the patient's headache intensified, and the patient experienced neck stiffness and sensitivity to light. The patient was sent to the hospital by ambulance and suspected to have been suffering from meningitis, and was in a critical condition. Presently (by the time of report on 01-JUL-2009), the patient had been paralyzed in hospital for the past 9 months, and was unable to eat, talk or move. Additional information has been requested.

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abasia, Activities of daily living impaired, Disturbance in attention, Dizziness, Insomnia, Loss of consciousness, Nausea

Symptom Text: Information has been received from a consumer concerning her 12 year old student daughter with no known drug allergies who on 09-MAY-2007 was vaccinated with the first dose of GARDASIL. On 08-AUG-2007 the patient was vaccinated with the second dose of GARDASIL. In September 2007, the patient developed severe nausea and severe dizziness, unable to function-can't walk, stand up, read, no computer work. The patient could not go to sleep at night because when she closed her eyes the dizziness was even worse, black outs. Symptoms lasted from 10 minutes to several hours. The patient missed a total of 30 days of school in 2007. This year she missed 27 days of school. Symptoms continued. Studies of X-rays, MRI, CT scan, vestibular testing, sleep studies, EEG were all negative. Severe nausea, severe dizziness, black outs, can't walk and missed a total of 30 days of school in 2007 and 27 days this year were considered to be disabling and other important medical events by the reporter. Additional information has been requested. 9/28/09 Note in vaccine records. Patient had 2 doses of Gardasil. Did not complete series.

MedDRA PT Headache, Myalgia, Pain in extremity, Similar reaction on previous exposure to drug, Syncope

Symptom Text: Information has been received from a Health Authority (HA reference number PEI200914058) concerning a 14 year old female with a history of sinus bradycardia and slightly underweight who on 14-MAY-2009 was vaccinated with her second dose of GARDASIL (lot number, injection site and route not reported). Concomitant therapy included contraceptives (not otherwise specified). One week prior to reporting, on 21-MAY-2009 (reporting date form dated 28-MAY-2009), the patient experienced myalgia, pain in limbs and headache. On 27-MAY-2009, the patient experienced syncope. On an unspecified date, she was admitted to hospital. The patient recovered completely on an unknown date. It was reported that after the first vaccination with GARDASIL on 12-JAN-2009, the patient experienced syncope (WAES 0907USA00656). This is one of two reports regarding the same patient. Other business partner numbers included: E2009-05563. Additional information has been requested.

MedDRA PT Activities of daily living impaired, Fatigue, Hypersomnia, Immediate post-injection reaction, No reaction on previous exposure to drug, Syncope

Symptom Text: Information has been received from a physician concerning a 14 year old female patient with no pertinent medical history and no drug reactions or allergies who in approximately October 2008, was vaccinated with a first dose of GARDASIL vaccine (lot # not reported) intramuscularly. In December 2008 she received second dose of GARDASIL (lot # not reported) intramuscularly. In the same visit in December 2008, she received a dose of VAQTA (manufacturer unknown). There was no concomitant medication. In December 2008" right after the dose" of GARDASIL vaccine the patient developed chronic fatigue, fainting spells. The patient slept 20 hours a day and had not been attending school. The patient sought medical attention was at office. At the time on the report on 06-JUL-2009 the patient had not recovered. On unspecified date psychiatrist evaluation was performed (results not reported). The patient did not experience any adverse effects after the first dose of GARDASIL. The physician mentioned that he did not feel that the symptoms were related to GARDASIL. Chronic fatigue, fainting spells, slept 20 hours were considered to be disabling. Additional information has been requested.

MedDRA PT Abdominal pain, Aphonia, Asthenia, Chest discomfort, Cough, Crying, Dizziness, Dysgeusia, Dyspnoea, Fatigue, Headache, Hypersensitivity, Injection site pain, Injection site swelling, Laryngitis, Malaise, Respiratory tract congestion, Restless legs syndrome

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 13 year old female who on 14-JUN-2007, was vaccinated with the third dose of GARDASIL IM into her left arm (lot # 655154/1210U). On 14-JUN-2007 the patient experienced abdominal pain, aphonia, asthenia, chest discomfort, cough, crying, dizziness, dysgeusia, dyspnoea, fatigue, headache, hypersensitivity, injection site pain, injection site swelling, laryngitis, malaise, respiratory tract congestion and restless legs syndrome. The symptoms included coughing, trouble breathing, loss of voice, malaise, crying, headache, chest discomfort, pain at injection site with swelling, dizziness, abdominal pain, weakness, fatigue, restless legs. There was no pre-existing illness. The patient required an emergency room visit (ER) visit. On 10-JUL-2009 ER medical records of 10-MAY-2007 was received. The final diagnosis was laryngitis. Records revealed patient had had chest congestion, dry cough and abnormal taste for 1 week. The patient was seen by a primary care physician (PCP) and diagnosed with allergies. Over the counter (OTC) allergy medication was not helpful. A chest X-ray (CXR) was within normal limits. The patient was treated with oral antibiotics and cough syrup. The patient was discharged to home with PCP follow up. The listing indicated that one or more of the events was considered to be disabling and immediately life-threatening. No further information is available. The original reporting source was not provided. The VAERS ID# is 351067. A standard lot check investigation was performed. All in-process quality checks for the lot number in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the Center and was released.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain, Areflexia, Biliary colic, Dizziness, Faeces discoloured, Guillain-Barre syndrome, Hypokinesia, Malaise, Mental status changes, Pain in extremity, Sensory loss, Vomiting

Symptom Text: Initial information was reported on 15-JUN-2009 by the mother of the patient. Additional information was received on 16-JUN-2009 from a health care professional concerning a 17 year old female who in April 2008 was vaccinated with the first dose of GARDASIL (batch number unknown) and the second dose of GARDASIL (batch number unknown) on 30-JUN-2009. In August 2008 the patient was hospitalized and diagnosed with GUILLAIN-BARRE syndrome. The outcome was not reported. Case is closed. Follow-up information has been received from patient's physician on 30-JUN-2009. According to the medical records the patient was hospitalized from 17-AUG-2008 to 26-AUG-2008 after being diagnosed with GUILLAIN-BARRE syndrome. During the period from September to December 2008 the patient was hospitalized for one month and then received non-institutional care (physical therapy) three times per week. On 08-JAN-2009 the patient reported malaise, pain in arms and legs, abdominal pain and bright colored feces to the doctor (onset on unspecified date). The patient was treated with CITODON (BIOPHAUSIA), DEXOFEN (BIOPHAUSIA), and SPASMOFEN (MEDA) to relieve the pain. The doctor was hesitant due to GUILLAIN-BARRE syndrome to prescribed Selective serotonin reuptake inhibitors (SSRIs) for her ability to make decisions. On 10-FEB-2009 she visited the doctor. The doctor described the patient's situation after the physical therapy (during September to December 2008) as a very tough period with total loss of sensibility and peripheral loss of the ability to move. The symptoms has gradually gone into regress and she had now regained a lot of her former energy and ability even though she still had some way to go before she would be completely recovered. The patient still experienced heavy loss of reflexes. The most complicated thing had been the attacks of pain in the abdomen that on five occasions had caused her to seek medical attention at the ER (dates not reported). The pain appeared and worsened within 5-10 minutes and could then last for several h

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain upper, Chest discomfort, Convulsion, Dizziness, Dyspnoea, Feeling of body temperature change, Flushing, Headache, Heart rate increased, Hot flush, Hypoventilation, Insomnia, Loss of consciousness, Oropharyngeal pain, Palpitations, Panic attack, Polydipsia, Syncope, Tremor, Viral infection, Vomiting

Symptom Text: Information has been received from a consumer via CSL as part of a Business agreement (manufacturer control # 20090701JZ1) concerning an 18 year old female patient who on 22-APR-2009 received the first dose of GARDASIL and on 22-MAY-2009 the second dose of GARDASIL. Ten to 15 minutes after the second dose, the patient felt faint. In the following couple of days, the patient experienced fainting, vomiting, severe headaches and stomach aches. The patient was reported to have been drinking water excessively in the nights following the second dose of GARDASIL. On 14-JUN-2009, the patient developed sore throat and saw the physician on 16-JUN-2009 who diagnosed her as having a virus. On 17-JUN-2009, the patient had a sleepless night, awaking at 3 am to go to the bathroom, when she experienced extreme pressure on the left side of her head. Upon returning to bed, the patient had hot and cold flushes, extreme palpitations and pressure on her head and chest. The patient then experienced an extreme panic attack and was taken to the hospital where her heart rate measured 150. On 18-JUN-2009, the patient felt very dizzy, headache, and pressure on her chest. On 19-JUN-2009, the patient experienced seizures, shaking violently from shoulder down to hands, the shaking alternating from left to right side, and blacked out for one to two minutes at a time. The patient was taken to the hospital for investigation. The neurologist prescribed APILIM, which the patient took from 19-JUN-2009 to 21-JUN-2009. The patient's MRI was normal but her EEG showed at irregular brain pattern. Presently, the patient was still experiencing difficulty sleeping with rapid, shallow breathing when asleep and problems with breathing.

Other Meds: Unknown

Lab Data: magnetic resonance imaging, ??Jun09, normal; electroencephalography, ??Jun09, irregular brain pattern; total heartbeat count, 17Jun09, 150

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Anxiety, Autoimmune disorder, Central nervous system inflammation, Dyspnoea, Gait disturbance, Pleurisy, Wheezing

Symptom Text: Information has been received from media monitors and via agency as part of a business agreement concerning a 26 year old fit and healthy female who was vaccinated with GARDASIL. Subsequently two weeks after receiving GARDASIL, the patient found it difficult to breathe. The patient reported that she was limping around the house like a stroke victim, wheezing and worried she was suffocating. The patient went straight to a hospital emergency room. At the hospital, the patient had x-rays, blood tests and an MRI. The patient was told that the lining of her left lung become so inflamed that it was rubbing against her chest wall each time she breathed. A medical consultant told her that she must have picked up some mysterious virus. She was released with no diagnosis other than pleurisy and was given painkillers (not specified). Five months after receiving the vaccine a neurologist confirmed that she had damage to her left side and it was an autoimmune reaction, resulting in inflamed lining of the left lung and nerves on the left side with a temporal connection to GARDASIL. Additional information is not expected.

Symptom Text: Information has been received from a consumer concerning her 17 year old daughter with no pertinent medical history and no known drug allergies/drug reactions who "in August 2007" was vaccinated with the first dose of GARDASIL on the right arm. The patient received the second dose in December 2007. There was no concomitant medication reported. It was reported that "within the week of the first vaccination" the patient had been experiencing seizures and fainting after having first dose of GARDASIL. It was reported that the patient started to feel "electric shocks" on the right side of the body along with muscles spasms. She also had strange headaches and petit mal seizures. The patient saw a physician. An electroencephalogram (EEG) and magnetic resonance imaging (MRI) were performed (results not provided). It was reported that the patient had not recovered at the time of the report. Upon internal review, the events of seizures and petite mal seizures were determined to be other important medical events. Additional information has been requested. 9/15/09 Received PCP medical records. FINAL DX: atypical HA; possible seizures Records reveal patient experienced rash, mono, OM, migraine HA, URI, UTI, abdominal pain, fibula fracture from diving accident, . Referred to dermatology & neuro. Neuro eval of 10/08 revealed atypical HA, electric shock type pain, staring spells, mild speech difficulty, intermittent balance problams. Tx w/meds & improved.

MedDRA PT Injected limb mobility decreased, Injection site pain

Symptom Text: Information has been received on 03-JUL-2009 from a pediatrician through the health authorities concerning a 16 year old female who on 03-JUN-2009 was vaccinated intramuscularly with the second dose of GARDASIL (lot# not reported). On 03-JUN-2009 the patient developed a very severe pain at the injection site during 3 days, to the point that she could not raise her arm anymore, and the pain decreased but was still ongoing on 26-JUN-2009. Ice and NSAID's were suggested to the patient, but she did not apply the treatment. At the time of reporting the patient had not yet recovered. As per the reporter this was a medically significant event due to a temporary incapacity. Other business partner numbers included: E2009-05627. Additional information has been requested.

MedDRA PT Convulsion, Cyanosis, Syncope, Unresponsive to stimuli

Symptom Text: Information was obtained on request by the company from the agency via a public case detail concerning a 23 year old female patient who on 16-OCT-2008 was vaccinated with a dose of GARDASIL (Lot # 0353U and Batch # NG51820) intramuscularly. It was reported that on 16-OCT-2008 the patient experienced syncope and convulsion. Child felt well after having had GARDASIL, but within about a minute after receiving GARDASIL, the patient collapsed onto the floor and looked to be fitting and unresponsive. The patient regained consciousness within 20 seconds and the colour remained grey. The patient required a visit to the doctor. The charted blood pressure was 117/70 (lying with feet elevated). Pulse was 57 and regular. The blood sugar level was 9.6 (post prandial, 1 hour) and Glasgow coma scale was reviewed by GP (was observed for 15 minutes further). The patient had recovered at the time of the report. On 02-FEB-2009, the patient had since reviewed dose 2 number AEFI. The vaccine was administered by the GP lying down. The patient reports that her sister had a similar reaction to her first GARDASIL dose. The agency considered that syncope and convulsion were possibly related to vaccination with GARDASIL. The original reporting source was not provided. Follow-up information reported that the agency considered convulsion to be serious as an other important medical event. Additional information is not expected.

Other Meds: Unknown

Lab Data: blood pressure measurement, 117/70, lying with feet elevated; blood glucose, 9.6, post prandial, 1 hour; Glasgow coma scale, reviewed by General Practitioner; observed for 15 minutes further; total heartbeat count, 57, regular

History: Unknown

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Grand mal convulsion, Immediate post-injection reaction, Loss of consciousness, Pallor, Syncope, Tremor

Symptom Text: Information has been received from a certified medical assistant concerning a 17 year old female patient who on 18-JUN-2009 was vaccinated with 0.65 ml of the first dose of GARDASIL (Lot:661766/0652X). There was no concomitant medication. Immediately after vaccination the patient had a seizure. They called an ambulance, and by the time the ambulance got there the patient was fine and laughing and did not need to leave in the ambulance. Additional information has been received from an office person who stated that the patient's DOB was 13-MAY-1992. After the 17 year old female patient received GARDASIL she began to shake, became unconscious and had a tonic- clonic seizure that lasted for 15 seconds. An Ambulance was called to take the patient to the hospital. The patient "came to and was fine". The patient was not postictal, had no rash and had no difficulty breathing. The patient's blood pressure and EKG were normal. The patient's mother did not want the patient to go to the Emergency Room. The physician evaluated the patient and recommended that the patient have a CT scan of the brain and an EEG. The patient was approved for both diagnostic tests. The patient's mother took the patient home. Upon internal review, tonic-clonic seizure was considered to be an Other Important Medical Event. Additional information has been requested. 7/16/09 PCP recs rec'd. WCC 6/18/09 with normal exam except hematoma under 2 toe nails. HPV#1 given. Pt immediately devloped pallor and syncope with tonic/clonic seizure activity lasting 5-10 sec. EMS called but parent declined transport.

Other Meds: None

Lab Data: electrocardiogram, 06/18/09, normal; blood pressure, 06/18/09, normal. Labs and Diagnostics: CT brain (-). EEG normal.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Clonus, Epilepsy, Gaze palsy, Hypotonia, Immediate post-injection reaction, Loss of consciousness, Memory impairment, Syncope, Vertigo

Symptom Text: Information has been received from a pediatrician concerning a 17 year old female patient with no relevant medical history reported who received the second dose of GARDASIL (Lot # 0160X and Batch # NJ11070) on 06-JUL-2009. Immediately after vaccination, she experienced a syncope associated with a "mini epileptic fit". She developed initially vertigos, then she lost rapidly consciousness, she presented a revulsion of the eye balls and clonic movements of lower and upper limbs. The revulsion of the eyeballs lasted for a few seconds. The loss of consciousness lasted for 2-3 minutes. The patient was being laid down. The events evolved into hypotonia. Furthermore, the patient had no memory of the episode. The patient's blood pressure and pulse were checked when the episode was over and were normal. To be noted that she had not experienced apprehension nor pain. The patient spontaneously recovered. The reporter considered this case as serious and was reluctant to administer the third dose. According to him, the reaction was linked to the vaccine. The primary reporter considered the patient's adverse experiences to be other important medical events. Other business partner numbers include: E2009-05691. No further information is available.

MedDRA PT Cranial nerve disorder, Dyspnoea, Erythema, Facial palsy, Facial paresis, Fall, Inflammation, Laboratory test, Muscular weakness, Myasthenia gravis, Myasthenia gravis crisis, Overdose, Respiratory failure, Syncope, Thymectomy

Symptom Text: Information has been received from a Physician Assistant concerning a 12 year old female patient with pertinent medical history reported as none and drug reactions or allergies reported as none who on 15-JUL-2008 was vaccinated with a first dose of GARDASIL (lot # 660387/1967U) 0.5ml (also reported mg) intramuscularly. Concomitant therapy included prednisone and PRILOSEC. In March 2009 the patient experienced difficulty breathing. She was taken to the hospital and "as per mom she was given an adult dose of morphine and went into respiratory failure". She later was unable to smile or move her face. Her cranial nerves were affected and she was seen by neurology. Later she was sent to a hospital for myasthenia gravis crisis. She had been hospitalized 3-4 times and she had received rehabilitation therapy. Most recently approximately on 16-JUN-2009, she had a "thymomectomy", secondary to myasthenia. The Physician Assistant and Physician did not feel the events were connected with GARDASIL. At the time of the report on 07-JUL-2009 the patient was recovering. There were many unspecified laboratories and diagnostics tests performed results not reported. She had not received any additional doses of GARDASIL. Difficulty breathing, respiratory failure, cranial nerves affected, given adult dose of morphine, and myasthenia gravis crisis were considered to be immediately life-threatening, disabling and other important medical events. "Given adult dose of morphine" was considered to be an overdose. Additional information has been requested. Medical records received DOS 7/15/08 to 7/7/09. Assessment: Myasthenia Gravis. Patient presents with continued fainting. Can't raise arms, not able to cough, laugh, very weak. Falls, drops things. Redness and inflammation where spinal tap was done. Facial weakness. PMH: \ksk

Other Meds: Morphine; PRILOSEC; prednisone

Lab Data: Unknown. Medical records received DOS 7/15/08 to 7/7/09. LP

History: None. Medical records received DOS 7/15/08 to 7/7/09. Ear pain, sore throat.

MedDRA PT Back pain, Diplegia, Pain, Vaccine positive rechallenge

Symptom Text: Information has been received from an on line media article via agency as part of a business agreement concerning a healthy 15 year old female who was vaccinated with the first dose of GARDASIL. Subsequently the patient experienced severe lower back pain and paralysis of the legs and spent six weeks in hospital. The patient was advised to get the second dose of GARDASIL. Within two hours of receiving her second dose of GARDASIL, the patient experienced paralysis of the legs again. It was reported that "they just gave out on her while she was walking along". Twelve month later, the patient almost drowned, her leg paralysis recurs regularly and she was re-admitted to hospital. The patient is in excruciating pain and the daily physiotherapy makes it worse. Morphine helps her sleep for a few hours but then the pain starts again. The patient's relatives say that not one medical person would say that GARDASIL was responsible for her condition and despite an MRI no one has a diagnosis. This is one of several reports from the same source. Additional information is not expected.

MedDRA PT Caesarean section, Drug exposure during pregnancy, Inappropriate schedule of drug administration, Neonatal disorder, Urinary tract infection

Symptom Text: Information has been received from a 42 year old female physician with a history of urinary tract infection, 1 pregnancy and 1 live birth through caesarean delivery who in June 2008, was vaccinated with GARDASIL. There were no concomitant medications. Subsequently, she became pregnant. Date of last menstrual period was 25-JUN-2008. The remaining two doses were not given. In June 2008, the patient experienced vaccination exposure during pregnancy. During the course of pregnancy, the mother experienced urinary tract infection which was treated with antibiotics. Urinary tract infection was considered not related to GARDASIL. In April 2009, she gave birth to a live female infant through repeat c-section. The second dose was given to the mother on the 1st week of May 2009. In May 2009, the infant experienced faint murmurs which were detected through 2D echo done on the same month. It was noted that the infant had normal heart sounds during the previous month. Upon Consultation with a pediatrician, the parents were advised to observe the infant for another month as this might resolve spontaneously. In June 2009, 2D echo was again done and showed the same results. The patient's mild pulmonic stenosis persisted. The reporting physician said that both she and her husband had no history of cardiac problems. Relationship of pulmonic stenosis with GARDASIL is unknown at the time of reporting. No further information is available.

MedDRA PT Convulsion, Incontinence, Loss of consciousness

Symptom Text: Information has been received from a registered nurse concerning her daughter, 13 year old female who on 09-APR-2009 was vaccinated with first dose of GARDASIL. The nurse vaccinated her daughter for the second dose of GARDASIL at home on 09-JUN-2009 at around 8:30am. After 5 minutes of vaccination, the patient experienced loss of conscious, convulsion. After CPR, the patient regained conscious but incontinence started to appear subsequently. She was sent to ER at that night. ECG and blood test were performed and the results were normal. Per doctor advice, she was hospitalized for 1 day and CT Plain was also conducted on that night with normal result. After recovering from the above adverse events, she was discharged and MRI was conducted on 03-JUL-2009 and the result was awaiting. EEG was also planned on 11-AUG-2009. Both MRI and EEG were performed by the reporter requested. Causality was unknown as determined by ER doctor. Additional information is not expected.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Crying, Depressed level of consciousness, Dizziness, Dyskinesia, Fall, Fundoscopy normal, Haemorrhage, Headache, Loss of consciousness, Nausea, Skin laceration, Tachycardia

Symptom Text: Shortly after receiving her Gardasil, patient felt a little bit tachycardic (did not report this until later). She walked up to the desk at the nurse's station to receive her paperwork and stated she felt dizzy. As the nurse at the desk got up to help her, she fell to the floor. She was unconscious at the time. Shortly thereafter she made some purposeless movements of both upper extremeties. Within about 30-60 seconds her movements became more purposeful and she began to speak and cry. BP was 100/50 and pulse was approx 120. We asked if she would like to see her father and she nodded. Dad was found in the waiting room and brought back to where she was lying on the floor. A 1 inch linear laceration was found on her posterior occiput. It bled copiously initially but stopped bleeding within a few minutes. At that point patient was awake and had no complaints of neck pain. She did complain of head pain. Responses at that point were appropriate but a bit slow. We helped patient sit up, and transferred her to a stretcher in an exam room. Fundoscopic exam was normal. She was oriented x3 (and remained so). The initial plan was to clean and close her head laceration and send her for an outpatient CT, but she continued to complain of nausea when she rolled to either side, so we were unable to access the laceration. She tolerated sitting up a little ways. She did try to stand up once about 1 hour after the initial event and took a few steps, and then complained of dizziness and had to sit back down. She was helped back to the stretcher. We decided at that point to transfer her to ED via ambulance.

MedDRA PT Neuritis, Pain in extremity, Paraesthesia, Vomiting

Symptom Text: Information has been received via an Agency from a physician concerning a 13 year old female who on 13-MAY-2009 was vaccinated IM with GARDASIL (lot# 1401F, batch# NF46010) 0.5mL. On 28-May-2009, the patient experienced neuritis sensory. It was reported that first symptoms (pain and tingling sensation in left arm) occurred 15 days after vaccination (on 28-MAY-2009). The symptoms started after gym class and they were very intense during the night that the patient vomited (considered a symptom of the neuritis). On 03-JUN-2009, during examination there were no signs of pathological changes except pain and tingling sensations in left arm as reported by the patient. The patient had no headache. On 05-JUN-2009, the patient's mother reported by phone that the patient was feeling better and that pain was not so intense any more and that she had no tingling sensations any more. The reporter felt that neuritis sensory was possibly related to therapy with GARDASIL. The reporter considered neuritis sensory to be an other important medical event. Additional information has been requested.

Seriousness: ER VISIT, HOSPITALIZED, LIFE THREATENING, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abdominal pain upper, Autoimmune disorder, Chills, Cystitis, Disseminated intravascular coagulation, Escherichia sepsis, Incorrect route of drug administration, Injection site pain, Kidney infection, Malaise, Nausea, Pyrexia, Vomiting

Symptom Text: Information have been received from two registered nurses concerning an 18 year old female with no pertinent medical history who on 07-JUL-2009 was vaccinated with a first dose of GARDASIL (lot# 658271/0558X) via subcutaneous route and MENACTRA (lot#U2906AA) concomitantly at separate injection site. Late on 08-JUL-2009, the patient started having chills; on 09-JUL-2009, the patient developed stomach cramps, vomiting, a fever of 103.5, the patient "was very ill". Her arm was sore at the injection site. The patient visited the doctor on 10-JUL-2009 who gave her "a suppository" and put her on ZOFRAN (GlaxoSmithKline), but "it did not do a thing". That night, the patient went to the emergency room where a virus was suspected; later that night, the patient was admitted to hospital. The patient's condition was "very grave". She was shown to have an increased WBC and falling platelets (laboratory values not available), which "indicated that she was having an auto immune response to vaccine". The patient was put on IV LEVAQUIN (Ortho-McNeil) and IV potassium. Her platelet count started to improve after getting LEVAQUIN. The patient was diagnosed with disseminated intravascular coagulation (DIC). A blood test was positive for e-coli. It was reported that "They are not sure where the e-coli came from, whether or not a vaccine was infected with e-coli." Even though there were no symptoms of a bladder infection, the patient was shown to have had a bladder infection which led to a kidney infection which entered the bloodstream causing sepsis (e-coli). The patient was discharged on 15-JUL-2009. The patient was presently feeling better and had had "no fever for 48 hours". The patient's platelet count was better, and she was still feeling nauseous. There were virus tests done while she was at the hospital, but the results had not come back yet. At the time of reporting, the patient was recovering. The symptoms were considered to be immediately life-threatening and disabling by the registered nurse. A lot check has been requested

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received for the pregnancy registry for GARDASIL from a master of science in nursing concerning a 26 year old female with no pertinent medical history and allergy to erythromycin who on 24-MAR-2008 was vaccinated with the first 0.5mL dose of GARDASIL IM (Lot No. 655604/0052X) and on 19-MAY-2008 was vaccinated with the second 0.5mL dose of GARDASIL IM (Lot No. 660389/1968U). Concomitant therapy included MOTRIN and vitamins (unspecified). The patient received her first two doses of GARDASIL and is now pregnant. The patient sought medical attention, seen by the practice. The last menstrual period was on 01-JUL-2008. On an unspecified date, was performed a urine pregnancy test and a serum pregnancy test resulting positive. Estimated date of delivery approximately on 07-APR-2009. The patient has not experienced any known symptoms. Follow up information has been received from a case manager in the office, concerning a 26 year old female who on 17-FEB-2009 "lost" the baby. However, the mother is fine. The office hasn't really followed her and doesn't have much more information. Upon internal review: the patient "lost" her baby, was considered as other important medical event. No further information is available.

Other Meds: MOTRIN; vitamins (unspecified)

Lab Data: urine beta-human, positive; serum beta-human, positive

MedDRA PT Confusional state, Convulsion, Ear infection, Grand mal convulsion, Loss of consciousness, Otitis externa, Pyrexia, Swollen tongue, Tachycardia, Tongue biting, Unresponsive to stimuli

Symptom Text: Information has been received from a consumer concerning her 19 year old daughter with no medical history and drug allergies, who in approximately "September 2008" was vaccinated with her 1st dose of GARDASIL. The 2nd dose was unspecified. On 29-MAY-2009, the patient received the 3rd dose of GARDASIL, 0.5ml, IM. Subsequently, the patient had a seizure when she was sleeping on 25-JUN-2009. She was sent to ER but was not admitted. There was no concomitant medication. Lab diagnostics studies included EEG, CAT scan, and MRI. The patient had seen a neurologist about the seizure. The patient had recovered from seizure on 25-JUN-2009. Follow-up information had been received through a phone call, a nurse concerning that the patient was vaccinated with her 1st dose of GARDASIL (Lot#660391/0063X) on 16-JUL-2008, concomitantly received ADACEL (lot# C2994AA), HAVRIX (lot# AHAVB235BA), and tuberculin purified protein derivative (PPD) (LOT#C2907BA), results negative. The 2nd dose of GARDASIL (lot# 659184/0843X) was administered on 10-OCT-2008, and concomitant therapy included FLUMIST (lot#50545P). On 28-MAY-2009, the patient received the 3rd dose of GARDASIL (lot# 662300/0100Y), 0.5ml, IM. On 25-JUN-2009, the patient had a seizure and was taken to hospital but not admitted. The patient's CT scan was negative and EEG results were pending. The patient mother felt that the patient's seizure and was taken to hospital but not admitted. The patient's CT scan was negative and EEG results were pending. The patient mother felt that the patient's seizures were linked to GARDASIL vaccinations. Upon internal review, seizure was considered to be an other important medical event. Additional information has been requested. 7/21/09 ER records received DOS 6/25/09. Assessment: New Onset Seizure. Parent witnessed patient's seizure in bed. Lost consciousness, unresponsive, confusion. Patient presents with trace swelling of tongue, tachycardia. To have MRI with Gandolinium. 9/11/09 Medical records received DOS 7/16/08 to 7/14/09. General

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Drug exposure during pregnancy, Pregnancy on oral contraceptive

Symptom Text: Information has been received from the health authorities concerning a 17 year old female who was vaccinated with two doses of GARDASIL (batch# not reported) and two doses of ENGERIX (GlaxoSmithKline) respectively on 30-MAR-2009 and 28-MAY-2009. She had also received two doses of PRIORIX (GlaxoSmithKline) respectively on 23-MAR-2009 and 08-JUN-2009. She became unexpectedly pregnant whereas she was taking YASMIN without oversight, without concomitant treatment and without any episode of diarrhea or vomiting. Her LMP dated back to 17-MAR-2009. Estimated conception date was on 10-APR-2009. Consequently, she received a dose of each vaccine before pregnancy and a dose of each in the "maximal high-risk period of malformation" during pregnancy. To be noted that the Health Authorities considered the case as serious due to the medical ineffectiveness. But according to them, YASMIN was possibly ineffective and possibly related to the event, but the vaccines were not related neither to the medicine ineffectiveness nor to the event. Other business partner numbers included E2009-05798. No further information is available.

MedDRA PT Aggression, Confusional state, Convulsion, Crying, Eye movement disorder, Fall, Gaze palsy, Head injury, Headache, Listless, Loss of consciousness, Mood altered, Nausea, Opisthotonus, Pain, Syncope, Tension

Symptom Text: 2nd dose of gardasil administered in check in room in left upper arm. Allowed to go, walked around the corner to check out and my daughter's eyes rolled back in her head and she began falling backwards. As she fell, her arms were drawn into her chest and her back was arched. She hit the floor full force on the back of her head and her hands remained tensed and pulled to her chest and her eyes began moving back and forth rapidly and then went back into her head again. Her pulse at this time was 62. She was in a total state of confusion once she regained consciousness and was very listless. A dr began asking her questions which she was unable to answer some of. No one checked her pupils with light. An ambulance was called from the hospital adjacent to the clinic and she was admitted to the ER. For the first 30-45 min in the ER she cried uncontrollably from the pain and her mood took an agressive turn. Her blood sugar was checked and an attempt to give her tylenol by mouth was made but she was combative and would not take it. She was taken to have a CT scan and returned. The CT came back normal and urine and blood were checked. We were discharged with a diagnosis of vasovagal syncope. My daughter had a seizure and not just a fainting spell. I witnessed the drawing up of the arms and the eye movements. I honestly thought she was dieing right there in from of me. She is a VERY healthy child involved in sports with no history of fainting or seizures and none in our family. As of today, she is still suffering from a severe headache and nausea so I would not be able to say she has recovered.

MedDRA PT Acne, Amenorrhoea, Concussion, Contusion, Dizziness, Excoriation, Fall, Hyperandrogenism, Hypoglycaemia, Multiple injuries, No reaction on previous exposure to drug, Pallor, Polycystic ovaries, Syncope, Weight increased

Symptom Text: This case was received from a health care professional on 10-JUL-2009. An epicrisis written by the patient's parents, one report on finding from an OPD and one hospital report was forwarded. Information has been received from a general practitioner concerning a 15 year old female who on 09-AUG-2007, was vaccinated with a third dose of GARDASIL (injection site and route not reported, lot number 1536F, batch number NF35190). In October 2007, the patient developed amenorrhea, since February 2008, her weight increased remarkably (up to 18kg until August 2008) and since August 2008, she experienced relapsing dizziness and syncope. Since May 2009, syncope reappeared, followed by falls and several injuries such as costal contusion abrasions and commotion cerebri. The patient was hospitalized from 16-SEP-2008 until 22-SEP-2008. The diagnoses were hyperandrogenemia in the scope of polycystic ovarian syndrome with secondary amenorrhea, reactive postprandial hypoglycemia, neurocardiogenic syncope and acne comedonal. Examination showed increased weight of 70Kg at a length of 169cm. Further physical examination was normal. Blood sample at admission day showed increased AP with 142U/L (normal range 47-119 U/L), hormonal analysis showed increased values of testosterone with 3.62 mmol/L (normal range 0.5 - 2.6 mmol/L), increased androstendion with 4.63ng/mL (normal range 0.55-2.0ng/mL) and 17-OH pregesteron with 6.76 g/L (normal range < 2.0g/L). Therefore treatment with metformin was recommended. The patient experienced syncope for a few seconds during the tilting table test and previous nitroglycerin administration. Thyroid and abdominal sonography, ENT examination, ECG, prolonged blood pressure measurement and cranial MRI showed normal results. A dermatologic examination showed severe acne comedonal of face, chest and back. Treatment with benzoyil peroxide and differine was recommended. The oral glucose tolerance test showed a minimal blood sugar of 48mg/dL within three hours. This result was discussed to be a cause for the oc

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse for the pregnancy registry for GARDASIL concerning a 16 year old female who on 24-SEP-2008 was vaccinated with a first dose of GARDASIL 0.5 ml IM. Subsequently, the patient was found to be pregnant. On 10-OCT-2008 the patient was 6 weeks gestation. The last menstrual period was approximately 29-Aug-2008. The estimated due date is 05-Jun-2009. The patient sought medical attention by calling the nurse. Follow-up information was received from another registered nurse who reported that the patient was vaccinated with a first dose of GARDASIL (lot# 660616/0570X) 0.5 ml IM on 24-SEP-2008. Concomitant therapy included prenatal vitamins (unspecified). At the end of September 2008 or beginning of October 2008, the patient underwent a routine ultrasound without result provided. At the end of November 2008, after Thanksgiving, the patient experienced spontaneous abortion (less than 20 weeks). The outcome of the patient was not reported. Upon internal review the spontaneous abortion was considered to be an other important medical event. Additional information is not expected.

MedDRA PT Chest pain, Dyspnoea, Erythema, Inappropriate schedule of drug administration, Oedema peripheral, Pruritus

Symptom Text: Information has been received from a 28 year old female who on 27-JUN-2009 was vaccinated with GARDASIL (LOT # 0739X) (inappropriate age at vaccine administration). Concomitant therapy included Hep A and Hep B vaccines (Manufacturer unknown). On 27-JUN-2009 the patient experienced breathing difficult due to strong pain on chest and swelling on the right hand fingers. On 28-JUN-2009 the patient experienced swelling, redness and itchy on the right foot. On 29-JUN-2009 the patient recovered from strong pain on chest, breathing difficult and swelling on the right hand fingers. As of 29-JUN-2009, the patient was recovering from swelling, redness and itchy on the right foot. The reporter also informed she went to an ER and was placed on therapy with an unspecified IV antiallergic and sodium chloride solution. Upon internal review, chest pain, dyspnea, edema, pruritus, right foot swelling and erythema were determined to be an other important medical event. No further information is available.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Activities of daily living impaired, Areflexia, Blepharospasm, Blood glucose decreased, Bone pain, Chest discomfort, Drug hypersensitivity, Gait disturbance, Headache, Muscle spasms, Muscle swelling, Muscle tightness, Neuralgia, Neurological symptom, No reaction on previous exposure to drug, Pain, Paralysis, Speech disorder, Tremor, Ultrasound scan, Walking aid user, West Nile virus test positive

Symptom Text: Third in series Lot #0653x Manufacturer Merck Did not have any unusual reactions after first two My otherwise healthy, active, athletic 14-year-old daughter has experienced serious neurological symptoms 15 days after her 3rd HPV shot. She was transported by EMS to Hospital after she experienced sudden onset paralysis that began at her feet and rapidly spread to just below her shoulders within 24 hours. You could not touch her anywhere below her chest, as even the slightest touch was excruciatingly painful. Her chest felt as though she had a tight band around it. It was difficult for her to talk, and it became difficult for her to keep them open. Jolts of pain would surge up her spinal cord into her head. Her torso muscles front and back swelled. For three days she could not lift or reposition any part of her body beneath her chest. She lost all reflexes in her legs. On day four, she began to move again - very slowly, very deliberately, with assistance. She was released on day 5, with a walker, anti-inflammatory and anti-depressant medication. It took a total of 10 days and extensive Physical Therapy for her to be able to walk "normal" again. She has seen Neurologists, Neurosurgeons, Pediatricians, Rheumotologists, Internal Specialists, Pediatricians, Physical Therapists, Psychologists, and Social Workers. They have run MRI's, CT's, Ultrasounds, and x-rays. She has had two lumbar punctures (they missed the first time), blood tests, and urine tests. The medical professionals have ruled out Guillain Barre, Epstein Barr, Acute West Nile, Lyme disease, encephalitis, meningitis, muscular dystrophy, multiple sclerosis, and bacterial infection but do not have the slightest idea what is going on! The only abnormal findings include: MRI showed arachnoid cyst with accentrical deviation from T2 to T10, but no impingement or damage noted to spinal cord. This MRI was repeated in October, and has shown no change in size, and shows no compression. The Neurosurgeons felt that the cyst was most likely

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Amnesia, Areflexia, Asthenia, Brain oedema, Confusional state, Demyelination, Disorientation, Dysstasia, Electroencephalogram, General physical health deterioration, Guillain-Barre syndrome, Hypokinesia, Nuclear magnetic resonance imaging abnormal, Presyncope

Symptom Text: Information has been received from a nurse practitioner. The nurse practitioner reported that "she was sent an email by one of her patient's mothers who received it from another mother stated that a 15 year old female patient, who was not patient of the nurse practitioner, on 23-JUL-2008 was vaccinated with the first dose of GARDASIL and then two days later the patient almost passed out and was weak for hours. Through the rest of the summer and school year the patient complained that she could not run as fast and was weak. Then on October 17, 2008 the patient received her second dose of GARDASIL and on October 21st the patients mother received an urgent message from the school nurse to take her daughter immediately to her pediatrician. The patient was experiencing confusion, was disoriented, barely could stand, had no reflexes in her feet, and couldn't remember anything that happened that day. The patient was then taken to her pediatrician's office who advised her to see a neurologist. A week later when she saw the neurologist they did a EEG and a MRI because they thought she had a brain tumor, and the patients memory was slowly coming back. Then a second MRI was done which showed she had a demyelination that usually occurs either with GUILLAIN BARRE or with multiple sclerosis. Then later on the patient was diagnosed with GUILLAIN BARRE. The patient was given a spinal tap which showed no permanent damage, inflammation of her brain is going down, she has no debility". GUILLAIN BARRE was considered to be disabling by the nurse practitioner. Additional information has been requested.

MedDRA PT Areflexia, Hypoaesthesia, No reaction on previous exposure to drug, Nuclear magnetic resonance imaging normal, Pain in extremity, Paraesthesia, Paresis, Pelvic pain

Symptom Text: Information has been received from a health care professional concerning an 18 year old patient who was vaccinated with a third dose of GARDASIL (lot # not reported), site and route not reported on an unspecified date. About 4 weeks p.v. the patient experienced paresthesia of the left thigh, hypalgesia in the supply area of lumbar vertebra 3 (L3) left, paresis of M. quadriceps and M. psoas left with loss of the reflex of M. quadriceps and pain of the pelvis minor and left leg. MRI was carried out and showed normal results. Further neurological investigations were planned. Previous doses of GARDASIL were well tolerated. Paresis, hypalgesia, paresthesia of the lower limb and pain were determined to be an other important medical event. Other business partner's numbers included: E2009-05865. Additional information has been requested.

MedDRA PT Abasia, Abdominal pain, Arthralgia, Fall, Injected limb mobility decreased, Limb injury, Nausea, Pain in extremity, Paraesthesia, Swelling, Ultrasound scan normal, Vaccination complication

Symptom Text: Information has been received from a health authority concerning a 15 year old female with no medical history who was administered on 04-NOV-2008 a dose of GARDASIL (batch number not reported) by intramuscular route (site of administration not reported). It was reported that on the 11-NOV-2008 the patient visited the paediatrician because she had not been able to move her right arm since vaccine administration; her condition has worsened progressively until she'd experienced pain during finger movement. The patient had been to the hospital where she was diagnosed with a postvaccination brachialgia. On the 26-NOV-2008 a sonogram was performed, results were normal. According to a follow up included in the health authorities report (exact date not reported), it has been informed that the patient presented with nausea and abdominal pain on the 09-JAN-2009. It was reported that on the 15-FEB-2009 the patient fell from a staircase with a resulting superficial arm traumatism. On the 20-FEB-2009 the patient started with paresthesia and tingling sensation in hands. By the 27-FEB-2009 the patient had a left hemifacial paresthesia and polyarticular pain. Finally on the 09-MAR-2009, the patient entered the doctor's office with the use of crutches; she was unable to walk because of knee and foot pain with tumefaction. The patient was referred to hospital. Outcome has not been reported for these events. "The CA has only coded the final diagnoses, brachialgia, the other manifestations were mentioned in the narrative field and have been added according to the general coding rules". Case reported as serious by the HA with other medically important condition as criteria. Other business partner's numbers included: E2009-05818 and ES-AGEMED-621215241. Additional information has been reported.

Seriousness: DIED, HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT AIDS encephalopathy, Acute respiratory failure, Aphasia, Blood pressure fluctuation, Brain death, Brain herniation, Brain oedema, Cerebrovascular disorder, Condition aggravated, Confusional state, Death, Drug abuse, Dysarthria, Encephalitis, Endotracheal intubation, Facial palsy, HIV infection, Heart rate irregular, Hypoaesthesia, Hyporeflexia, Hypoxic encephalopathy, Kidney fibrosis, Lymphadenopathy, Meningeal disorder, Meningitis, Mental status changes, Migraine, Pleocytosis, Pulmonary congestion, Pupil fixed, Spinal cord disorder, Unresponsive to stimuli, Vasculitis cerebral

Symptom Text: Information has been received from an investigator concerning a 37 year old female with HIV and a history of migraine headaches and methamphetamine abuse for 20 years who entered a study. On 08-MAY-2009 the patient was enrolled in A5240 and vaccinated IM with the first dose of GARDASIL, 0.5ml, in deltoid. On 22-JUN-2009 the patient developed the following adverse events: altered mental status grade 3 (dysarthria, anomia, confusion); headache grade 3 (presented to HD 22-JUN-09 with AMS, HA). CT angle of head showed diffuse cerebral edema); left hand numbness grade 2. On 02-JUL-2009 the patient developed decreased neurological reflexes grade 4 (life threatening), pupils fixed and dilated bilaterally grade 4 (life threatening), and death. The report was as follows: The patient presented to emergency department on 22-JUN-2009 with migraine-like headache, left hand numbness, dysarthria and anomia. CT read as normal, patient discharged, the patient returned on 23-JUN-2009 with persistent headache, anomia. At that time, she was not on treatment for HIV and her CD4 count was 263. She was admitted to the neurology service and empirically treated with antibiotics for bacterial and HSV meningitis. Lumbar puncture showed borderline low glucose, elevated protein and a lymphocytic pleocytosis without red blood cells, CSF tests for EBV, HSV, VZV, Cryptococcus, VDRL, AFB smear were negative as well as CSF culture for bacteria, fungus and mycobacteria. CSF cytology was negative, flow cytometry was not performed. JC virus PCR was ordered, but results not reported. Toxoplasma IgG was negative. Blood cultures, coccidioidomycosis titers, serum cryptococcal antigen, RPR were all negative. Prior quantiferon testing in 2004 was positive without subsequent isoniazid treatment chest X ray during admission was negative as were 2 sputum for AFB smear and culture. MRI showed diffuse cerebral edema with leptomeningeal enhancement. Repeated lumbar puncture showed normalization of glucose. During the hospitalization, her symptoms had improved.

MedDRA PT Alopecia, Depression, Emotional disorder, Folliculitis, Seborrhoeic dermatitis, Vaccination complication

Symptom Text: Initial information has been received from a health authority an agency (reference # ES-AGEMED-421214341) via Sanofi Pasteur concerning a 15 year old female patient who on 22-JUL-2008 was vaccinated with a dose of GARDASIL (Lot # and site not reported) IM. It was reported that 16 days after vaccine administration, on 07-AUG-2008, the patient was diagnosed with a pubic area folliculitis, which became generalized by November 2008, microbial and mycological test were performed (date not reported) with negative results. On 24-NOV-2008, the patient developed seborrheic dermatitis accompanied with hair loss. On 02-FEB-2009 (reported as 02-FEB) and 24-FEB-2009 (reported as 24-FEB) the patient visited her general practitioner due to emotional disturbance episodes, on 05-MAR-2009, the patient was diagnosed with a depressive reaction. TRYPTIZOL was prescribed (start and stop dates not reported), the patient did not tolerate this medication so it was changed to ESERTIA. The reporter indicated GARDASIL vaccination complication as a possible diagnosis. The health authority coded seborrheic dermatitis, depression and folliculitis as the only adverse events in the AE field. The rest of the events reported such as hair loss, emotional disturbance and depressive reaction, vaccination complication have been mentioned in the narratives of this case. Case reported as serious by the HA with other medically important condition as criteria. Laboratories performed: on 10-Sep-2008 bacterial test: negative results. On 22-Dec-2008, serum calcium test 10.5 mg/dl. On 22-Dec-2008, serum immunoglobulin E test 7.3 mg. On 22-Jan-2009, blood glucose test 82 mg. On 19-Feb-2009, serum calcium test 9.9 mg/dl. On 05-Mar-2009, serum 25-hydroxyvitamin D2 test 16.1 mg. On unknown date, microbial test: negative results and mycological test: negative results. Other business partner numbers include: E2009-05929. Additional information has been requested.

MedDRA PT Dyspnoea, Haematoma, Idiopathic thrombocytopenic purpura, Petechiae, Pyrexia, Thrombocytopenia

Symptom Text: Information has been received from a Health Authority (case # 95340) through (local case # IT074/09). Initial report received on 25-FEB-2009. An 11 year old female was vaccinated on 3-FEB-2009 at 4:03 pm with the second dose of GARDASIL (batch number NJ36070, IM, lot number 0779X). On the same day at about 4:30 pm, she presented with scattered petechiae on the upper and lower limbs, transient low grade fever and transitory dyspnea. The duration and outcome were not reported. Case closed. Follow up received on 08-JUL-2009 from Health Authority. On 06-FEB-2009, the patient was hospitalized in the Hematology / Pediatry department for serious thrombocytopenia at 11000 platelets/mm3, petechiae and lower limbs hematoma. WERLHOF disease was diagnosed after bone marrow punction and corticosteroids were prescribed. The patient received treatment with 4 vials of UGOROL, URBASON 360 mg intravenously and ZANTAC 300 mg. Discharge work up showed leukocytes at 16200 (unit not specified); Hemoglobin at 13.6 g/dL, Blood platelets at 119000 (unit not specified). On 24-APR-2009, the patient still received corticosteroid treatment. This case was reported as non serious by Health Authority on 25-FEB-2009. It was upgraded from non serious to serious on 13-JUL-2009 because follow up information specified that the patient was hospitalized. Other business partner numbers include E-2009-01650. The case is closed. No further information is available.

MedDRA PT Drug exposure during pregnancy, Muscle spasms

Symptom Text: Information has been received from a consumer for the Pregnancy Registry for GARDASIL concerning her 18 year old daughter who on 24-MAR-2008 was vaccinated with her first dose of GARDASIL (lot# not reported) and was pregnant. The patient's estimated LMP was 09-FEB-2008. The pregnancy was confirmed with a pregnancy test. The patient sought unspecified medical attention and the physician's information was not available. Follow-up information has been received from a Certified Medical Assistant, who reported that their office did not have any records of the patient receiving GARDASIL injections. In follow-up, the Certified Medical Assistant indicated that on 04-NOV-2008 the patient delivered a normal, healthy male baby weighing 8 pounds, 11 ounces via vaginal delivery. The patient had no complications in her pregnancy, just some "muscle spasms". There was no indication that there were any problems with the baby either. The mother returned for her postpartum exam on 19-DEC-2008 and had a full normal exam and had an intrauterine device (IUD) inserted for contraception. The Certified Medical Assistant contacted during telephone follow-up could not supply the following information: lot number, healthcare provider name and contact information. No further information is available at this time. No further information is available at this time.

Other Meds: Unknown

Lab Data: Physical examination, 12/19/08, postpartum exam: full normal exam; Beta-human chorionic, positive

MedDRA PT Systemic lupus erythematosus

Symptom Text: Information has been received from a health authority (ref.#: NL-LRB-88950) concerning an adult female patient who had received a third dose of GARDASIL (batch# not provided). It was reported that she had received GARDASIL according to the schema; she had no complaint after the first and the second dose. She developed symptoms shortly after the last injection. She has systemic lupus erythematosus since December 2008: this appeared 2 months after the last dose and 8 months after the first injection. The patient was admitted to hospital and treated with prednisolone, CELLCEPT and PLAQUENIL and had not recovered at time of reporting. Concomitant drug: DEPO-PROVERA (150mg every 3 months since February 2003) and ethinyl estradiol (+) levonorgestrel (0.03/0.158mg once a day since July 2002). Patient is form country origin, where SLE (systemic lupus erythematosus) is occurring more frequently. The reporter mentioned as other possible causes: heredity, race. The following event (and latency) was coded in the report received from agency: systemic lupus erythematosus (6 months). Noteworthy: The reporter's "summary" (latency of 2 months after last dose, 8 months after first dose) is in contradiction with the coded adverse event where the "reaction first time" is 6 months. Reporter's "summary" mentions concomitant medication (cfr supra) where as agency "narrativeincludedclincal" mentions that comedication is unknown. Other business partner numbers included: E2009-05867. No further information expected.

Other Meds: DEPO-PROVERA, Feb03 - Cont; ethinyl estradiol (+) levonorgestrel, Jul02 - Cont

MedDRA PT Drug exposure during pregnancy, Premature labour

Symptom Text: Information has been received from the pregnancy registry for GARDASIL vaccine from an 18 year old female consumer, who started therapy with GARDASIL vaccine "last year". On 01-May-2008 she was vaccinated in the arm with third dose of GARDASIL vaccine. On 12-May-2008, the patient found out she was pregnant, she does not know her exact trimester but does know she's very early in her pregnancy. Unspecified medical attention was sought, but no date of last menstrual period, or due date was reported. Follow-up information has been received from a physician's office concerning the patient's pregnancy outcome. It was reported that on an unknown date the patient delivered prematurely a normal infant weighting 4 lb and 13 oz. No congenital anomalies were noted. The patient's and and baby's final outcome was not reported. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Vaginal haemorrhage

Symptom Text: Information has been received from the pregnancy registry for GARDASIL via a nurse practitioner, concerning a 22 year old female with a history of asthma who on 25-APR-2008 was vaccinated with the first dose of GARDASIL, 0.5 ml, IM, (Lot#659962/1740U). The patient sought unspecified medical attention at the office and had a confirmed pregnancy test. Her last menstrual period was reported as 22-MAR-2008, and her due date is 27-DEC-2008. No other symptoms have been noted. Follow-up information has been received from the nurse practitioner, for GARDASIL, a Pregnancy Registry product. On 25-APR-2008 the patient had urine beta-human chorionic gonadotropin test (ECG) performed which was negative. The reporter noted that the last contact with patient was on 14-MAY-2008, when she called to report pregnancy, 8 weeks gestation. And the patient experienced scant pink vaginal discharge. The patient did not return phone calls on 16, 19, 22-MAY-2008, nor to card sent on 22-MAY-2008. The estimated date of delivery was 28-DEC-2008. The pregnancy outcome was unknown. No further information is available.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Drug exposure during pregnancy, Neonatal disorder, Premature labour

Symptom Text: Information has been received from a physician, for the Pregnancy Registry of GARDASIL, concerning a 24 year old female with anxiety and depression and no known allergies who on 15-Oct-2007 was vaccinated with the first dose of GARDASIL. On 14-Jan-2008 the patient was vaccinated intramuscularly with the second 0.5ml dose of GARDASIL (lot number 659055/1522U). Concomitant therapy included WELLBUTRIN. The patient is pregnant. Her LMP was 07-JAN-2008. Due date was 13-OCT-2008. The third dose was not administered. On 14-JAN-2008 the patient was placed on WELLBUTRIN. The patient took WELLBUTRIN for three weeks and then the patient stopped taking it since it was not working. The patient was not experiencing any problems. The patient sought unspecified medical attention via office visit. Follow-up information received from the physician reported limited pregnancy outcome information. On approximately 17-Aug-2008 the patient delivered a baby "at around 32 weeks gestation, almost two months early". The physician did not remember exactly and did not have the patient's chart at her immediate disposal. The physician also followed the baby in her practice. The physician reported " he was now around nine months old and weighed around 15 pounds. He had some failure to thrive issues and had some developmental delays". No further information was provided at this time. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Neonatal disorder

Symptom Text: Information has been received through the Merck pregnancy registry for GARDASIL vaccine from a registered nurse concerning a 20 year old female patient with juvenile diabetes and no known allergies who on 19-May-2008, was vaccinated with the first dose of GARDASIL vaccine (LOT # 658222/0927U) 0.5 ml IM. On 29-JUL-2008, was vaccinated with the second dose of GARDASIL vaccine (LOT # 659653/1448U) 0.5 ml IM. Concomitant therapy included insulin (manufacturer unknown). The patient was now pregnant. The last menstrual period was on 01-JUL-2008. On an unspecified date, pregnancy test was performed and resulted positive. No other symptoms were noted. The patient called the doctor for medical attention. Estimated date of delivery on 07-APR-2009. Follow-up information received from the registered nurse revealed that the patient had delivered a baby boy in March 2009 (exact date not known). She mentioned that the baby did have some "heart trouble"; the patient was told that her baby had a "rapid heartbeat". The baby was treated with INDERAL (additional details not known). The registered nurse reported that the patient was told by her doctor that her baby's rapid heartbeat was related to the patient's juvenile diabetes. It was reported that the patient did continue to wear an insulin pump. The reporter stated that she had seen the baby and he did "look normal". She confirmed that the patient had no congenital anomalies. Additional information was received from the nurse the next day. She reported that the baby was born on 18-MAR-2009. The nurse stated that she had said the baby's heart trouble as a "rapid heartbeat" was listed as an "enlargement heart" and was being treated with INDERAL. She had no further information to provide. This is one several reports from the same source. Additional information has been requested.

MedDRA PT Drug exposure during pregnancy, Pregnancy induced hypertension

Symptom Text: Information has been received from a physician for the Pregnancy registry for GARDASIL, concerning a 25 year old female with no drug allergies and no medical history who on 22-Sep-2008 was vaccinated with the second dose of GARDASIL. Concomitant therapy included vitamins prenatal. Subsequently the patient determined to be pregnant. A urine pregnancy test on 07-Oct-2008 was positive. The pregnancy questionnaire was received on 15-Oct-2008, which indicated that the patient had two previous pregnancies and one full term (40 weeks birth) Date of LMP was 06-Aug-2008 and EBD is 13-May-2009. Second dose of GARDASIL was reported as 22-Sept-2008 (lot# 0573X). No history of reported pre-term deliveries, spontaneous terminations, elective terminations, fetal deaths and birth defects. On 07-Oct-2008, the patient was prescribed prenatal vitamins. Follow-up information from a physician revealed that the patient experienced no infections or illness but hypertension (date unknown) during pregnancy. The hypertension was treated with Pro Cardia XL 30mg, oral daily on 05-Jan-2009 (duration not reported). During the patient's pregnancy, she underwent the following diagnostics tests: on 25-Dec-2008, a Quad screen showed a negative result. Ultrasound done on 04-Dec-2008, 08-Jan-2009 and 27-Mar-2009 showed normal results. On 22-May-2009, 41 Weeks from the LMP, the patient delivered a normal, healthy female baby weighing 7 pounds 4 ounces with a length of 18.75 inches. No complication occurred during labor/delivery. The baby had Apgar score of 7/9 and congenital anomalies. Additional information is not expected.

MedDRA PT Anaemia, Drug exposure during pregnancy

Symptom Text: Information has been received from a medical assistant through the Pregnancy registry for GARDASIL concerning a 17 year old female with no previous pregnancies who on 17-Sep-2008, was vaccinated with the second dose of GARDASIL (lot# 659180/1758U) and then discovered that she was pregnant. There was no concomitant medication. No adverse effects reported. Late last menstrual period 16-Aug-2008. Estimated delivery date 23-May-2009. A routine ultrasound was performed on 15-Oct-2000, which was normal. The patient was placed on prenatal vitamins. The patient did not receive the first 2 doses of HPV at the medical assistant's physician office. Follow up information has been received from the physician who reported that in 2009, the patient experienced mild anemia and was treated with ferrous sulfate 325 mg, daily from 11-Feb-2009 to 17-May-2009. Concomitant therapy during pregnancy included vitamins. On 17-May-2009, the patient delivered a normal female baby, at 39 weeks of gestation. The baby weighed 6 pounds, her length was 10.0 inches, and had on APGAR score of 9/9. There were no congenital anomalies and no complications or abnormalities reported. No further information is expected.

MedDRA PT Drug exposure during pregnancy, Migraine

Symptom Text: Information has been received from a registered nurse, for the Pregnancy Registry for GARDASIL, concerning a female who in approximately 2007 was vaccinated with the second dose of GARDASIL. She was pregnant at the time the vaccination was administered. Her last menstrual period was in approximately March 2007. The patient did have her child who is approximately 17 months old currently. Following the birth, the patient received the third dose of GARDASIL. The patient sought medical attention. Follow-up information was received from the nurse. She reported that the patient's baby was healthy and normal. Follow up information has been received from the registered nurse concerning this 25 year old female who was vaccinated with the 1st, 2nd and 3rd doses of GARDASIL (1st lot #653735/0688F, 2nd lot #655165/1425F and 3rd lot #659441/1446U) on 13-NOV-2006, 19-JAN-2007 and 04-JAN-2008 respectively. Subsequently, the patient was pregnant at the time of vaccination. The patient's last menstrual period (LMP) was 02-JAN-2007. Her estimated date of delivery was 09-OCT-2007. It was noted that the patient had one elective termination, one previous pregnancy and one full term delivery. There were no birth defects and no infant complications in her previous pregnancy. On 08-FEB-2007, a urine beta-human chorionic gonadotropin test was performed because the patient missed her period. The test result was positive. It was reported that the patient took IMITREX 100 mg as needed for the treatment of migraines during her first trimester. On 10-OCT-2007, 40 weeks from her LMP, the patient delivered a normal, healthy, female baby. There were no complications or congenital anomalies. The baby weighed 7 pounds, 1 ounce, her length was 10 1/2 inches and her head circumference was 14 inches. There were no complications during pregnancy or labor and delivery. Additional information is not expected.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Activities of daily living impaired, Chest pain, Dyspnoea, Fatigue, Headache, Lethargy, Malaise, Menstruation irregular, Pain, Paralysis, Phonophobia, Photophobia, Rash, Vaccine positive rechallenge

Symptom Text: Information was obtained from a regulatory agency via a public case details form concerning a 16 year old female patient who from 15-APR-2008 was vaccinated with GARDASIL (Lot not reported) 2 times. After the 1st dose, the patient experienced headaches, menstrual irregularities, pain, light and noise sensitivity and a rash (legs). After the second dose, the patient experienced paralysis, fatigue, lethargy, extreme pain, not responsive to codeine, headaches, chest pain, breathing difficulties, was seriously ill, rash and was unable to shower without assistance. The patient was admitted to hospital. Her events caused or prolonged inpatient hospitalization. Her mother had ceased employment to care for her daughter. Her daughter had missed 70% of school in the past 6 months and it was noted that her symptoms were episodic. At the time of report on 15-JUL-2009, the patient had not yet recovered and her care was still ongoing. The agency considered that all the symptoms were possibly related to therapy with GARDASIL. The original reporting source was not provided. No further information is available.

MedDRA PT Convulsion, Cyanosis, Grunting, Loss of consciousness, Pallor, Tremor

Symptom Text: Information was obtained on request by the company from the agency via a public case details form concerning a 13 year old female patient who on 08-JAN-2009 was vaccinated with a dose of GARDASIL (Lot: Batch: NH4770). On 16-JAN-2009, ten days post vaccination the patient was travelling in the back seat of a car and her mother heard grunting noise and noticed the child's head leaning to the side, her arms and legs then rose up and her body started to shake. The patient's lips were blue and skin color pale shade of grey, she was unconscious and this lasted 2-3 minutes. The patient's events caused or prolonged inpatient hospitalization (the patient was admitted to hospital). On 06-JAN-2009, the patient recovered from loss of consciousness, convulsion and pallor. The agency considered that loss of consciousness, convulsion and pallor were "possible" related to therapy with GARDASIL. The original reporting source was not provided. Additional Information is not expected.

MedDRA PT Arthritis, Chest pain, Neuralgia, No reaction on previous exposure to drug, Nuclear magnetic resonance imaging abnormal, Oedema peripheral, Pleurisy, Serology positive, Tendonitis, X-ray abnormal

Symptom Text: Information has been received from a health professional concerning a 17 year old female who was vaccinated with the first dose of GARDASIL (Batch #NF56480/Lot #0251U) on 14-OCT-2007 and with the second dose (Batch #NF58550/Lot #0276U) on 15-JAN-2008). These were well tolerated. She was vaccinated with a third dose of GARDASIL (Batch #NH13130/Lot#1172U) injection route not reported, into the left upper arm on 24-JUL-2008. In August 2008 the patient experienced thoracic pain. Pleuritis and neuralgia were evoked as differential diagnosis. Pulmonary embolism and myocardial infarction were excluded. The patient recovered from thoracic pain after 4 weeks. Also in August 2008 the patient developed swelling of the left forefoot. In October 2008 diagnosis of enthesitis associated HLA B27 positive arthritis was established. Diagnosis was supported by serology, x-ray and MRI of the left foot (no detailed information provided). Unspecified treatment was carried out. The patient was not hospitalized. The patient had not recovered at the time of report. A persisting damage was reported. This was originally reported by a health professional. Other business numbers included E2009-05872. Additional information has been requested.

MedDRA PT Grand mal convulsion, Syncope, Urinary incontinence

Symptom Text: Information has been received from a health professional concerning an 18 year old female who on 08-JUL-2009 was vaccinated with the third dose of GARDASIL (lot# 1883U, batch# NH50860) (dose, route not reported). 5 days later, on 13-JUL-2009, she was visiting the juvenile reception, by an unknown reason. At the reception, the girl experienced syncope and tonic-clonic cramps as well as urination. The woman was brought to the emergency and several tests (unspecified) and a data tomography was performed. Everything was normal. An Electroencephalogram (EEG) was planned as well as further investigations at the neurologist department. The patient received first and second dose of GARDASIL (dates and batch numbers not reported) without any adverse events. The outcome was not reported. Tonic-clonic cramps was considered to be an other important medical event. Other business partner numbers include E2009-05962. Case is closed. No further information is available.

MedDRA PT Cardiac stress test, Cough, Drug exposure during pregnancy

Symptom Text: Initial information has been received from a nurse practitioner, for GARDASIL, a pregnancy Registry product, concerning a 17 year old female with asthma who on 08-Oct-2008 was vaccinated with 0.5ml first dose of GARDASIL (lot# 660393/0067X). Concomitant therapy included Albuterol. Subsequently the patient was pregnant. Pregnancy tests were preformed and unspecified medical attention was sought. On 08-Jan-2009 and 08-Apr-2009 the patient was vaccinated with a 0.5ml second and third doses of GARDASIL (lot# 660393/0067X) respectively. On 17-Mar-2009 the patient delivered a healthy baby boy in a hospital. No adverse effects were reported. Follow up information has been received from the nurse practitioner on 19-June-2009 concerning the patient. Concomitant therapy included Ibuprofen. The patient underwent stress testing at 8 months. Normal testing. Started prenatal care at 8 months (received no prenatal care prior to 35-36 weeks) On 17-Mar-2009 she delivered a normal, healthy male baby, weighing 7 pounds, at 40 weeks and 4 days from the LMP. The baby's length was 21 inches, head circumference was 14 inches. There was no congenital anomalies or other compilations. There were no complications during pregnancy or labor/delivery. Medication taken during pregnancy included cough medications (Nyquil), once, for cough, started in fall month of 2008. No further information is available.

Other Meds: Albuterol; Ibuprofen, 200 mg.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Diarrhoea, Dizziness, Nausea, Syncope, Vomiting

Symptom Text: Information has been received from a physician concerning his 24 year old daughter with no pertinent medical history reported and no known drug allergies, who "about six weeks ago" (on approximately 04-MAY-2009) was vaccinated with first dose of GARDASIL (dose, route and lot number not reported). Concomitant therapy included PROZAC during the week she had premenstrual syndrome. "The same day of vaccination" (on approximately 06-MAY-2009), the patient fainted and developed vomiting, diarrhea and dizziness. The patient recovered from fainted, nausea and vomiting, diarrhea and dizziness "about three days after vaccination" (on approximately 07-May-2009). No lab studies were performed. The patient sought unspecified medical attention. Fainted, nausea and vomiting, diarrhea and dizziness were considered to be disabling by the physician because the patient missed work. Additional information has been received from the physician who reported that he would not be supplying any more information about his daughter's event. Since his daughter had received the vaccine and experienced the event at come clinic in another city, he did not have the vaccine date, lot number or adverse event onset date. The healthcare professional contacted during the telephone follow up call could not supply the following information: date of vaccination, lot number or date of event. Additional information is not expected.

MedDRA PT Rash, Upper respiratory tract congestion, Urticaria

Symptom Text: Information has been received from a physician's assistant concerning a 15 year old female who on 14-APR-2009 was vaccinated with second dose of GARDASIL (dose and route not reported, lot number 658563/1063U). The physician's assistant reported that after receiving the second dose, on the same day (14-APR-2009), the patient experienced congestion, hives and a rash on her face. The physician's assistant reported that the next day (15-APR-2009), "everything was cleared up and the patient was fine". The patient sought medical attention by calling the physician. Additional information has been requested.

MedDRA PT Gastrooesophageal reflux disease, Headache, Injection site pain, Sensation of foreign body

Symptom Text: Information has been received from a 22 year old female patient who on 20-FEB-2009 was vaccinated with the first 0.5 mL dose of GARDASIL. There was no concomitant medication. On 20-FEB-2009 (also reported as "two days after vaccination"), the patient experienced soreness at the injection site, headache and lump in her throat. Later the patient experienced acid reflux. The patient stated that she will not receive any further doses of GARDASIL. The patient sought unspecified medical attention. Two months later, on approximately 20-APR-2009, the patient recovered from soreness at the injection site, headache, lump in her throat and acid reflux. Additional information has been requested.

MedDRA PT Cyanosis, Dizziness, Feeling abnormal, Pallor, Syncope

Symptom Text: Information has been received from a registered nurse concerning a female patient who "3 weeks ago" on approximately 26-MAY-2009, was vaccinated with a dose of GARDASIL. Concomitant therapy included MENACTRA and other unspecified vaccines which were also given. On approximately 26-MAY-2009, after receiving the dose of GARDASIL the patient experienced syncope and turned blue. Oxygen was administered. The patient sought medical attention. The patient recovered within 20 minutes after the dose of GARDASIL was given. Follow-up information was received from a registered nurse concerning a 15 year old female patient. It was reported that on 12-MAY-2009, the patient received the first dose of GARDASIL (LOT # 661703/0651X). On 12-MAY-2009 the patient concomitantly received Tdap (manufacturer unknown) (LOT # C3029AA) and Hep A (manufacturer unknown) (LOT # AHABB319AA). It was reported that the patient did not receive concomitantly MENACTRA. After the patient had received GARDASIL, the patient became pale and light-headed. The patient never completely fainted. The patient's lips turned blue and the patient required oxygen for about 10 minutes. It took the patient "a long time before she felt normal". It was reported that the patient had eaten lunch before going to the physician's office. No further information is available.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Dizziness, Fatigue, Headache, Muscle tightness, Nausea, Vaccine positive rechallenge, Vomiting

Symptom Text: Information has been received from a pediatrician via foreign agency concerning a 12-year-old female patient with a medical history of a tick bite on 04-APR-2009 who was vaccinated with a second dose of GARDASIL (lot-no. 1400U; Batch NH38400) IM into the upper arm on 08-JUN-2009. Some days p.v. the patient experienced the same but aggravated symptoms as after Dose 1. She was hospitalized for two days. Several investigations including EEG (electroencephalogram) and routine laboratory were carried out and showed no pathological findings. Borrelia serology was performed by the reporter on an unknown date. No pathological findings were established. At the time of reporting the patient had not recovered. The parents considered the event as related to the vaccine. Some days after first vaccination with GARDASIL on 06-APR-2009 the patient experienced headache, dizziness, nausea and fatigue. She recovered on an unknown date (info added 03-JUL-2009). Additional information received on 26-JUN-2009. The preliminary hospital report dated 21-JUN-2009 was provided. Lot number for Dose 2 GARDASIL was NH 38400. The patient was hospitalized from 18-JUN-2009 until 21-JUN-2009. On 14-JUN-2009 the patient experienced nausea and vomiting. Since 15-JUN-2009, mainly in the evenings, she complained of persistent headache. Under treatment with IBUPROFEN (Nurofen liquid) only slight improvement. But tendentially headache was improving at the time of admission. Upon admission general and neurological examination was without pathological findings. EEG (electroencephalogram) on 19-JUN-2009 showed no pathologies. In the course of the in-patient stay headache reoccurred again and again up to a value of 4 on a scale to 6. Medication with METAMIZOLE liquid was given. Thereunder amelioration of headache. A presentation at the ophthalmologist was recommended. On 21-JUN-2009 the patient was discharged in a good general condition. Upon reporting form dated 26-JUN-2009 the patient had not recovered at the time of reporting. Dose 1 GARDASIL, lot-no. 1

Other Meds: Unknown

Lab Data: Electroencephalography, 19Jun09, no pathological findings; Diagnostic laboratory test, routine laboratory: normal; Diagnostic laboratory test, routine laboratory: no pathological findings; Ophthalmological exam, emmetropia, no patholog

MedDRA PT Bronchitis, Dyspnoea, Pain, Pyrexia

Symptom Text: Information has been received from a nurse concerning a 25 year old with a history of asthma female who on 18-JUN-2009 was vaccinated intramuscularly with the first 0.5mL dose of GARDASIL (LOT# 661531/1311X). On 19-JUN-2009, after receiving the dose, the patient developed shortness of breath, achiness and a fever of 101 F degree. The patient was treated in an emergency room. She was diagnosed with possible asthma or bronchitis or a reaction to the GARDASIL vaccination and treated with prednisone and ZITHROMAX. On 22-JUN-2009, the nurse spoke with the patient, and was told the patient was still achy, but was feeling better. Additional information has been requested.

MedDRA PT Myalgia, Pain

Symptom Text: Information has been received from a physician concerning a 13 year old female who at time of vaccination with unspecified sickness was vaccinated with a dose of GARDASIL (LOT# not reported, duration and dose not reported). Secondary suspect vaccination included PNEUMOVAX 23 (duration and dose not reported) and another unspecified vaccine. It was reported that the patient was "already sick" at the time of vaccination and went to the office for a check up and was administered the vaccinations. After receiving vaccinations, the patient experienced muscle achiness and soreness. At the time of the report it was reported that the patient was recovering. No further adverse event information provided at this time of report. No further information is available.

MedDRA PT Injection site pain, Injection site pruritus, Urticaria

Symptom Text: Mom called said she wanted it documented that pt had a reaction after the GARDASIL site was sore also came out in hives underarm gave BENEDRYL ok now. Pt reports that about 2 days post GARDASIL #2. The site of the immunization became very itchy, no rash noted at the site. Itching continued with application of BENEDRYL cream. It did not affect her activity. Mom confirmed above, and states itching did subside with a dose of BENEDRYL at beside. Two days later she developed hives under the opposite arm. It disappeared with one dose of oral BENEDRYL. She experienced no other symptoms and has been fine since. Mom did note that itching was documented on the Vaccine Information Sheet. Mom wanted to inform us since the Vaccine Information Sheet did advise reporting of hives. VAERS form will be completed and mailed upon discussion and evaluation by Physician.

MedDRA PT Wrong drug administered

Symptom Text: Information has been received from a registered pharmacist concerning a 17 year old female patient who on an unspecified date had been vaccinated with MENACTRA, prior to the first dose of GARDASIL (lot # not reported), IM route, that was administered on 17-JUN-2008. On an unspecified date, the patient returned to the office for her second dose of GARDASIL but was inadvertently given MENACTRA instead. The pharmacist mentioned that the lot number that was documented in her records correlated with MENACTRA. It began with an "M". The pharmacist was aware that the GARDASIL lot numbers are 4 numbers followed by an alpha and this was not how the dose was documented. On 30-DEC-2008, the patient returned to the office and received a third vaccination that was GARDASIL (lot # not reported), IM route. The pharmacist mentioned that the lot number patterns for the first and the third doses match the GARDASIL standard. No adverse effects were reported. Additional information has been requested.

MedDRA PT Eye pain, Intraocular pressure increased, Myodesopsia, Photophobia, Retinal disorder, Surgery, Visual impairment

Symptom Text: Information has been received from a license practical nurse concerning her 19 year old daughter with no pertinent medical history who on 20-JAN-2009 was vaccinated with the third dose of GARDASIL (lot# 661531/1311X). Other suspect vaccines received on that same date included: MMRII (lot# 656034/0182U), VARIVAX (Merck) (lot# 659845/0270X) and MENACTRA. Subsequently, on the same day the patient developed vision problems. Few days later she complained of pain in her right eye. She saw many "floaters" in her field of vision. Patient sought medical attention. She went to see an ophthalmologist and tested normal. Then she became sensitive to the outdoor and indoor lights. She saw a specialist and he determined that she had "inflamed retinal bilateral". She was given steroids into her eye but the pressure still increased. She then saw another doctor who determined that she had massive pressure in her right eye with "rainbow vision" and performed a surgery on her right eye on 23-JUN-2009 in an outpatient clinic. At the time of this report the patient was in post surgical treatments, recovering. Additional information has been requested.

MedDRA PT Gaze palsy, Loss of consciousness, Syncope

Symptom Text: Information has been received from a office assistant concerning a 14 year old female with unspecified drug reactions/allergies and medical history, who on unspecified date in August 2008 and on 21-Oct-2008 received first and second doses respectively of GARDASIL (lot number for the second dose: 661044/0548X, route not reported). There was unspecified concomitant medication. The office assistant reported the patient was given the first dose of the vaccine and 5 minutes later the patient "passed out" on an unspecified date in August 2008. Also the office assistant stated the second time, the patient was given the vaccine, syncopal episode was more severe and more "seizure like" and the "patient's eyes rolled back" (approximately 21-Oct-2008). On an unspecified date the patient was recovered from this, but was not given the third dose. The patient sought medical attention by consulted physician. Follow up information has been received from the office assistant who reported the patient with no known allergies with attention deficit / hyperactivity disorder and she took STRATTERA 26mg each morning. On 01-Aug-2008, the only vaccine was the first dose of GARDASIL and that was the only vaccine received that day. Five minutes after injection, the patient passed out at the reception desk and she did not need treatment and recovered quickly. On 21-Oct-2008, the only vaccine administered was the second dose of the GARDASIL vaccine and on that date the reaction was worse, with "eyes rolling back". The patient did not lose consciousness and the physician was able to speak with her during the event. The office assistant said the physician was able to speak with her during the event. The office assistant said the physician used the term "seizure like", but in fact the patient did not have a seizure. Again no treatment was necessary. No labs / diagnostic were performed. The patient did not need to go to the ER. And the patient will be not receiving the third dose. No further information is available.

MedDRA PT Dizziness, Drug exposure during pregnancy, Injection site pain, Loss of consciousness

Symptom Text: Information has been received from an 18 year old female patient with a history of fainting but no drug reactions or allergies who on 08-JUN-2009 was vaccinated IM with the first 0.5ml dose of GARDASIL (lot# 659054/0315Y). There was no concomitant medication. The patient reported that "after received the first dose of GARDASIL she passed out and her left arm was sore where she received the injection". A nurse reported that after the patient received her first dose of GARDASIL vaccine the patient became faint. The office told the patient to lie down and raise her feet; she was also given oxygen, some fluid and crackers. Then the patient found out by doing a home pregnancy test that she was 5 weeks pregnant. Therapy with GARDASIL was discontinued on 08-JUN-2009. It was reported that the patient sought unspecified medical attention. The patient recovered after about an hour from "became faint and passed out" on 08-JUN-2009 and left the office. The patient's outcome was unknown for vaccine exposure during pregnancy and left arm sore where vaccinated. Additional information has been requested.

MedDRA PT Nausea, Pyrexia, Vomiting

Symptom Text: Information has been received from a nurse concerning a 16 year old female with no medical history or drugs allergies, who in September 2008, was vaccinated with a first dose of GARDASIL. The patient received a second dose of GARDASIL on an unspecified date. The patient experienced nausea, fever and vomiting 6-9 hours after both doses. No laboratories studies performed. The patient sought unspecified medical attention. At the time of this report the patient had recovered. Additional information has been requested.

MedDRA PT Injection site pain, Injection site swelling, Wrong drug administered

Symptom Text: Information has been received from a physician concerning his 11 year old son with a history of numerous unspecified unimmunisations who was possibly accidentally vaccinated with a dose of GARDASIL, in 2009, the patient was going to get immunizations when he might have accidentally received an injection of GARDASIL. In 2009 immediately after receiving the injection, the patient stated that he had received the incorrect injection. When the physician checked with the clinic that he had received the correct unspecified injection, the records showed that he had received GARDASIL. The clinic insisted that there was a mix up in paperwork and he had not actually received GARDASIL. In 2009 after possibly receiving the GARDASIL, the patient experienced excruciating pain at the injection site and swelling at the injection site, further described as being the size of a baseball. It was unknown if there was any laboratory data. As of 26-JUN-2009, the patient continues to experience pain at the injection site at the injection site. Additional information has been requested.

MedDRA PT Dyspnoea, Immediate post-injection reaction, Influenza like illness, Joint lock, Migraine, Nausea, Pain in extremity, Vomiting

Symptom Text: Information has been received from a nurse practitioner concerning a 24 year old female with no pertinent medical history reported and no known drug allergies who on 27-JUN-2008 was vaccinated with first dose of GARDASIL (lot number 660393/0067X). Concomitant therapy included birth control (name unspecified). The nurse practitioner reported that on her annual exam of this year (2009) the office noticed that the patient the rest of the series of GARDASIL. The patient stated that was because of the experienced she had after receiving the first dose. The nurse practitioner reported that immediately after receiving the first dose on 27-JUN-2008, the patient experienced flu-like symptoms, shortness of breath, nausea, vomiting, and her arm was sore; her shoulder locked up and had a severe migraine. It was reported that the symptoms lasted for about two days. The nurse practitioner reported that the patient had now recovered. No lab tests were performed. The patient sought medical attention by calling the physician. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Amnesia, Bed rest, Brain contusion, Circulatory collapse, Concussion, Fall, Head injury, No reaction on previous exposure to drug, Retrograde amnesia, Syncope

Symptom Text: Case received from a health authority on 17-JUL-2009 under HA reference no. PEI2009015386. It was reported that a 17 year old female patient who was previously vaccinated with an unspecified number of doses of GARDASIL which were well tolerated, she was vaccinated with a dose of GARDASIL (lot number, injection site not reported) IM on 19-JUN-2009. A discharge summary was provided. About three minutes post vaccination the patient experienced an circulatory collapse and fell on her head followed by a short syncope in the gynecologist's practice. The patient lost her memory for about one hour. She experienced retrograde amnesia. On the same day the patient was hospitalized for monitoring and clarification. Clinical examination showed a right parietal contusion and commotion cerebri. Under observation and treatment with (CLEXANE) and bed rest the patient recovered and was discharged in good condition on 21-JUN-2009. Case is closed. Other business partner numbers include E2009-06045.

Other Meds: Unknown

MedDRA PT Condition aggravated, Demyelination, Lhermittes sign, Lumbar puncture, Nuclear magnetic resonance imaging brain abnormal, Paraesthesia

Symptom Text: Information has been received from a Health Authority (case n. 101290), through foreign agency (Local case n. IT302/09). A 17 year old female patient was vaccinated with the first dose of GARDASIL (Batch number NJ21670 and Lot number 1882U, IM, site of administration not reported expired on 31-DEC-2010) on 05-MAR-2009 and 07-MAY-2009, respectively. On 24-MAY-2009, she presented with paresthesia of hands, lower limbs and trunk in D4 and D5 and positive Lhermitte's sign. The patient was hospitalized. Brain MRI, multimodal evoked potentials, lumbar puncture were performed. Diagnosis of relapse of demyelinating disease was made. The diagnosis was made with isoelectric focusing (IEF). The patient received intravenous and oral methylprednisone. At the time of reporting, the patient improved and recovered completely from neurologic symptoms but a slight Lhermitte's sign persisted. The patient had history of periventricular and corpus callosum demyelination and retrobulbar optic neuritis that recovered after corticosteroid treatment. The final outcome is not reported. Case is closed. Other business partner numbers included: E2009-06078. No further information is available.

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Abasia, Asthenia, Back pain, Blood product transfusion, Chest X-ray, Dysphagia, Dyspnoea, Dysstasia, Eating disorder, Endotracheal intubation, Feeling abnormal, Gastrointestinal tube insertion, Guillain-Barre syndrome, Heart rate increased, Hypoaesthesia, Hypokinesia, Intensive care, Mobility decreased, Pain, Pain in extremity, Paralysis, Pneumonia, Posture abnormal

Symptom Text: Friday, June 26, 2009 morning - complained that her legs felt funny. Evening - complained her legs weren't working correctly and she couldn't run. Saturday, June 27, 2009 morning - unable to walk without assistance, fell if she tried to stand. Morning- taken to the local ER, sent home with crutches & a diagnosis of growing pains. Evening- unable to walk and cannot use arms. Evening - taken to ER an hour and 20 minutes from our home, preliminary diagnosis Guillain Barre Syndrome and was told she would be admitted to the hospital. Sunday, June 28, 2009 afternoon - admitted to Intermediate ICU from the ER. Evening - slowly things got worse, the numbness/paralysis continued progressing up her legs/arms, complained of incredible back and leg pain. First of 5 doses of IVIG began, one dose per day for 5 consecutive days. Monday, June 29, 2009 continual progression of paralysis throughout the day. Struggling to breathe. Oxygen thru a nasal canula used to help with breathing. Patient continued to be in pain. Placed on a feeding tube, unable to eat and swallow correctly. Tuesday, June 30, 2009 continued to struggle to breath. Still in continual pain. Very weak, neck was "baby like" and unable to support head. Very late transferred to the PICU for observation and placed on a Bi-Pap ventilator. Wednesday, July, 1, 2009 struggled with breathing, heart rate increasing throughout the day. Intubated between 11:30 and midnight. By this time paralysis was almost complete, no movement of legs and very little movement of arms, paralysis had obviously moved into the diaphragm causing the breathing problems. Patient was intubated for almost 4 weeks. During this time she had 2 bouts of pneumonia, numerous chest x-rays, respiratory treatments, MRI's, a PIC line was put in place, a central line was put in place for 8 plasmapherisis treatments, an EMG and SSEP confirming the diagnosis of Guillain Barre Syndrome. Patient also had had a rapid heart rate for some time. It isn't back down to normal. Patient is current

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain, Allergy test positive, Antinuclear antibody negative, Arthralgia, Asthenia, Borrelia burgdorferi serology negative, Colonoscopy, Computerised tomogram, Condition aggravated, Constipation, Diarrhoea, Endoscopy, Epstein-Barr virus infection, Fatigue, Feeling abnormal, Food allergy, Food intolerance, Full blood count normal, Hypoaesthesia, Insomnia, Laboratory test normal, Myalgia, Nausea, Neuropathy peripheral, Nuclear magnetic resonance imaging, Oesophagogastroduodenoscopy, Pain, Paraesthesia, Phonophobia, Red blood cell sedimentation rate normal, Rheumatoid factor negative, Vomiting, Weight decreased, Wheat-free diet

Symptom Text: Nausea & vomiting, abdominal pain, joint pain, numbness & tingling in hands & feet, fatigue, weight loss. Unable to eat certain foods. Developed allergy to wheat. These symptoms started 1 to 2 weeks after 1st vaccine. Pt stated felt like "she was 80 yrs old." Started wheat free diet, visited doctor, lab tests for celiac disease negative, numerous lab tests (lyme titer, cbc, rheumatoid workup, ANA, Sed rate, lupus and all negative. 2 months after vaccine peripheral neuropathy, joint pain symptoms improved. Continues with abdominal pain, weakness, weight loss & difficulty with foods. Diarrhea begins and continues to present. Work up by GI specialist includes EGD, colonoscopy, CT's, MRI, GI series, video capsule endoscopy, numerous lab studies. Allergy testing showing allergy to wheat. Positive for fructose malabsorption. Wheat free & fructose free diet. Work up continues after 1 year to find source of abdominal pain and watery diarrhea. 7/30/09 PCP records received 7/11/08 to note written 7/28/09. Initially presented 7/11/08 request to be tested for celiac disease. Reports 2 yr hx of abdominal pain, recently improved on wheat-free diet. Returned 8/11/08 with c/o 2 months hx of "everything hurting"- joints and muscles, fatigue, decreased sleep, sensitive hearing. Labs all WNL except (+) EBV Ab IgG showing recent infection. 10/8/09 Hospital records, DC summary received, service dates 3/16/09 to 3/18/09. Assessment: Chronic complex of abdominal pain with diarrhea. Patient developed myalgias, asthenia, fatigue, arthralgias, nausea and vomiting - now resolved. Lost weight. Constipated. Patient now presents with abdominal pain and postprandial diarrhea. Abdomen - diffuse tenderness to palpation. ICD-9 Codes: 564.1 Irritable bowel syndrome, 787.91 Diarrhea.

Other Meds:

Lab Data: Small bowel biopsy with intraepithelial lymphocytes. Labs: EBV IgG (+). 10/8/09 Hospital records 3/16/09 to 3/18/09. LABS and DIAGNOSTICS: CT Scan Abdomen/Pelvis - Abnormal.

History: Pectus Excavatum PMH: abdominal pain. 10/8/09 Hospital records 3/16/09 to 3/18/09. Blastocystis hominis infection. Possible Joubert's Syndrome.

MedDRA PT Aphasia, Fatigue, Fine motor delay, Headache, Muscle twitching, No reaction on previous exposure to drug, Thirst, Tremor

Symptom Text: Information has been received from a Health Authority (ref. # DK-DKMA-20091722) concerning a 14 year old female patient with no concurrent disease who on 11-DEC-2008 was vaccinated with the second dose of GARDASIL (Lot # 1941U and Batch # NJ01850) intramuscularly (site of administration not reported). The patient received no concomitant vaccine or medicine. It was reported that on 13-JAN-2009, the patient experienced an episode with twitching flexor of upper and lower extremity, tremor, some expressive aphasia, fine motor delay, headache and subsequently tiredness and thirst. It was reported that the patient was admitted to the hospital (no further specified). MR scan of cerebrum, EKG and analysis of Hb, infection parameter, liver count, kidney numbers, and glutamic acid revealed no abnormalities. No investigational analysis were specified further. On 02-OCT-2008, the patient was vaccinated with the first dose of GARDASIL (Lot # 1941U and Batch # NJ01850) intramuscularly (site of administration not reported). No adverse reaction was reported. Other business partner numbers include: E2009-06102. No further information is available.

MedDRA PT Influenza like illness, Paraesthesia, Pyrexia, Sensory loss, Visual field defect

Symptom Text: Information has been received from Foreign Health Authority (HA reference number: PEI2009015490), concerning 12-year-old female patient who was vaccinated with a first dose of GARDASIL (lot number: 1427U, batch number: NH17960, injection route not reported) into the left upper arm on 08-JUN-2009. On 15-JUN-2009 the patient experienced flu-like symptoms with fever for two to three days. On 17-JUN-2009 the patient developed visual field defect, sensory deficit reported as a "sock like" of the left upper arm and tingling of the left hand. On an unspecified date the patient was hospitalized. In cranial MRI (magnetic resonance imaging) was not indication of multiple sclerosis and acute disseminated encephalomyelitis. An ophthalmologist confirmed circular visual field defect on both sides but no other pathological findings. At the time of the reporting to HA (19-JUN-2009) the patient had not recovered. Other business partner numbers included E2009-06043. The reporter felt that the patient's experiences were important medical events. No further information has been received.

Other Meds: Unknown

MedDRA PT Condition aggravated, No reaction on previous exposure to drug, Partial seizures

Symptom Text: Information has been received from a pediatrician concerning a 15 year old female with history of convulsion disorder who on 13-JUL-2009 was vaccinated with the second dose of GARDASIL (lot#1695U, batch # NH25730). Concomitant therapy included LAMICTAL. During the following night, when she slept overnight at a girl-friend, the patient experienced a focal seizure. She did not seek medical attention after the event. The reported pointed out that the patient was currently in a critical condition as the parents were separating. In the last two years, the patient had been free of seizures under treatment with LAMICTAL and had normal EEG controls. The first dose of GARDASIL was administered on an unspecified date, was well tolerated. Focal seizure was considered to be an other important medical event. Other business partner numbers included E2009-05979. The case was closed. No further information is available.

Other Meds: Lamictal

Lab Data: Electroencephalography, normal the last two years.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Condition aggravated, Convulsion, Hyperventilation, Muscle rigidity, Syncope, Vomiting

Symptom Text: Information has been received from a Nurse Practitioner concerning a 17 year old female with a history of neuro- surgery in 2001 for malformation and laparoscopic surgery on left ovary for cyst who on 22-JUL-2009 was vaccinated with a first dose of GARDASIL (lot # not reported) 0.5ml, intramuscularly. There was no concomitant medication. On 22-JUL-2009 after vaccination the patient experienced syncope. Afterwards for 1-2 minutes, the patient experienced what appeared to be a seizure. The symptoms include tightening and straightening of the body with heavy breathing. An ammonia capsule was used. Also, it was mentioned that the patient vomited at home. In the afternoon, the patient was oriented and recovered. The mother of the patient mentioned that the patient had had previous experiences with seizures: First time occurred at the age of 10 years (unspecified cause), second occurrence happened at 14 years of age (unspecified cause) and the third time occurred in December 2008 when the patient had her bellybutton pierced. There were no laboratories diagnostics studies performed. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Convulsion

Symptom Text: Information has been received from a registered nurse concerning a 19 year old female who on 04-APR-2007 was vaccinated with first dose of GARDASIL (route not reported, lot number 655324/0088U). The registered nurse reported that the patient experienced seizure-like activity that occurred a few days after the first dose was given to the patient. It was reported that the patient received the second dose of GARDASIL (route not reported, lot number 655324/ 65863/1063U). It was unspecified if the patient had the same symptoms after she received the second dose because the registered nurse had not heard from the patient since her check-up on 08-APR-2007. The registered nurse reported that therapy with GARDASIL was discontinued on 26-OCT-2007. The patient sought medical attention by contacting the nurse. Upon internal review, seizure like activity was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Cognitive disorder, Dyskinesia, Hyperhidrosis, No reaction on previous exposure to drug, Presyncope, Tremor, Vomiting

Symptom Text: Information has been received from a nurse concerning a 22 year old female patient with penicillin allergy who on 07-JAN-2009 was vaccinated with the first dose of GARDASIL (lot number not reported). The patient received the second dose on 12-MAR-2009 (lot number not reported) and the third 00.5 ml dose on 13-JUL-2009 (lot number 661044/0548X). Concomitant therapy included YAZ. Subsequently, the patient experienced shaking, sweating and quivering. The patient also had jerk movement with her legs and her hands, and she was not cognitive for about 20 seconds after she received the third dose of GARDASIL. Later, the patient was given food and water, and right after that the patient had vomiting. It was unspecified if lab studies were performed. The patient stabilized after 45 minutes. It was reported that the patient had an empty stomach at the time of vaccination. The nurse also reported that the patient did not experience any adverse events after the first and second dose. Follow-up information received from the nurse on 20-JUL-2009: The lot number for all three doses is 661044/0548X. There was no concomitant therapy with the third dose. The patient's jerky movements were not tonic-clonic movements. The patient did not lose consciousness. There was no seizure happened. The vaccine was administered after the patient had a gynecology (GYN) exam and she was highly anxious. According to the nurse, the event (probably vasovagal) was considered as disabling for the 45 minutes during which the event occurred. No further information expected.

MedDRA PT Dyspnoea, Paraesthesia oral, Wheezing

Symptom Text: Patient experienced problems breathing deeply, had definite wheezing per her mother and then lips started to tingle. Mother said the event probably only lasted 10 minutes from start to finish with only 2 minutes intensity. This incident occurred about 35 - 40 minutes after administration of her first injection of Gardasil vaccine. She and her mother sat on an outside bench at a college campus during the intense 1 1/2 -2 minutes until the event was over.

Other Meds: 2 Extra Strength Tylenol administered at physician's office prior to vaccine administration.

Lab Data: Patient's visit was for a routine physical exam which included a negative urinalysis, fingerstick hemoglobin of 13.7 g/dL @ 10:30 a.m. and a tuberculin skin test (10 TU PPD)intradermally to her right forearm.

History: None really. Mom told me patient had upset stomach when much younger from the antibiotic Augmentin and reacted nervously or wildly from a "tuss" medication.

Prex Illness: None. This was patient's annual physical.

MedDRA PT Contusion, Fall, Grand mal convulsion, Haematoma, Head injury, Hypertonia, Immediate post-injection reaction, Injury, Loss of consciousness, Pupil fixed, Syncope

Symptom Text: Case reported by health authority (case n. 100804) (local case no. IT295/09). Initial report received on 15-JUL-2009. A 15 year female patient was vaccinated on 29-JUL-2009 with the second dose of GARDASIL (lot # 0512U, batch # NG22320, route and site of administration not reported). On the same day, immediately after vaccination, she felt and banged her head with loss of consciousness, presented diffuse hypertonia, fixed eyes and tonic clonic convulsion of the four limbs. The episode lasted a few seconds and the patient regained consciousness when spoken to by the physician. The episode was not critical and there was no retrograde or anterograde amnesia. On arrival at the emergency unit, the patient was vigilant, not disoriented, presented no vomiting, no amnesia, normal vital functions, normal cardiac and neurological examination. She presented eyebrow injury with hematoma sutured by a surgeon. ECG was normal. Hematology work-up was normal, EEG was negative, Neurological advice was sought and neurologist recommended hospitalization for observation. During hospitalization, clinical condition was good, without fever. NPI (neuropsychiatric inventory) and EEG (awake and sleeping) were performed and were normal. The patient had presented spasms during the previous year with EEG performed in another structure. In 2006, the patient resented frequent episodes of lipothymia induced by a rapid position changes during malaise or prolonged standing position. Cardiac and neurological examinations were normal. The patient was discharged on 03-JUL-2009 with diagnosis of cranial trauma without commotion and injury with contusion and hematoma secondary to syncope. At the time of reporting, the patient improved. The final outcome is unknown. Case is closed. Follow-up information received on 27-JUL-2009 from health authority: PET scan, CBC and psychiatric consultation were normal. Other business partner numbers include: E2009-05946. No further information is available.

Other Meds: Unknown

MedDRA PT Abdominal pain, General physical health deterioration, Headache, Laboratory test normal, Musculoskeletal stiffness, Nausea, Neck pain, No reaction on previous exposure to drug, Pain in extremity, Pyrexia, Vomiting

Symptom Text: Case received from Health Authority on 29-JUN-2009 under HA reference no. PEI2009013923. It was reported that a 13 year old female patient was vaccinated with a third dose of GARDASIL (lot # not reported) into the left deltoid muscle on 28-MAY-2009. 4 hours post vaccination, the patient developed fever (> 40 C) and headache. 7 hours post vaccination she experienced recurrent vomiting. The patient was hospitalized on unspecified date. Serology showed no pathological findings, meningitis was ruled out. The patient recovered from vomiting after two days, from fever and headache after three days. Previous two doses of GARDASIL were well tolerated. Follow up information was received on 17-JUL-2009. The hospital report of the paediatric hospital (28-MAY-2009 to 31-MAY-2009) was provided. At admission on 28-MAY-2009, the patient suffered from fever, headache and pain in limbs (verbatim, PEI coded infection). Previously she was treated with a single dose of ASPIRIN by her parents and she had presented to an other hospital before where she had been treated with sodium chloride (NaCl) infusion. Then she was transferred to the paediatric hospital and suffered additionally from abdominal pain, neck pain, nausea, vomiting, neck stiff and was in a reduced general condition. By several investigations, meningitis was ruled out. Laboratory values showed no pathological findings. After infusion therapy for two and a half days together with antipyrines, the symptoms improved. On 31-MAY-2009, the patient was discharged, completely recovered. The hospital physician considered the event as related to vaccination. Other business partner numbers include E2009-05405. No further information is available. Case closed.

MedDRA PT Optic neuritis, Scotoma, Vision blurred, Visual evoked potentials abnormal

Symptom Text: Case received from the Health Authorities on 20-JUL-2009 under the reference numbers AN20090365 AB200940373. A 17-year-old female patient with no relevant medical history and no concomitant treatment received the third dose of GARDASIL (lot #1941U, batch # NJ17150) via intramuscular route on 05-APR-2009. She had received the first dose and second dose via intramuscular route in October and December 2008. The morning of 11-MAY-2009, the patient developed a central scotoma in the right eye associated not painful associated with blurred vision. Ophthalmological work-up were normal on 14-MAY-2009. Retinal computed axial tomography (CT) scan was normal and retinal angiography was normal on 18-MAY-2009. The following work-up were normal on 19-MAY-2009: Complete blood count, platelets, erythrocyte sedimentation rate and toxoplasmosis serology. On 20-MAY-2009 neurological examination was normal except for central scotoma. Visual evoked potentials showed a latency asymmetry of the right optic nerve. Cerebral magnetic resonance imaging (MRI) performed on 02-JUN-2009 was normal. Fine cut magnetic resonance imaging (MRI) centered on the optic nerve performed on 13-JUN-2009 did not show any anomaly. In the weeks before symptomatology. There was no infectious syndrome. The patient was hospitalized from 19 to 31-MAY-2009. She was treated with SOLUMEDROL in the context of an optic neuritis retrobular. On 08-JUN-2009, there was a slight improvement but central scotoma persisted. Visual evoked potentials showed that the asymmetry had resolved. At the time of reporting, the patient had not yet recovered. The Health authorities assessed the causal relationship between the reported reactions and vaccination as "doubtful" according to the foreign method of assessment. Other business partner numbers include E2009-06137. No further information is available.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Back pain, Condition aggravated, Hypoaesthesia, No reaction on previous exposure to drug, Pain, Paresis, Urinary retention

Symptom Text: Information has been received from a pediatrician concerning a 17 year old female patient who received the first dose of GARDASIL on an unspecified date and was well tolerated and on 25-JUN-2009 was vaccinated with the second dose of GARDASIL (lot#1201U/batch# NG29090) intramuscularly with a dose of RECOMBIVAX (manufacturer unknown) intramuscularly. Concomitant therapy included hormonal contraceptives (unspecified). On 02-JUL-2009 the patient experienced lumbago with an augmentation of pain since 06-JUL-2009. She was treated with Ibuprofen 1800 mg per oral route daily from 02-JUL-2009 to 06-JUL-2009. On 08-JUL-2009, she developed hypoaesthesia of the right foot and pareses of extension and flexion of right foot and right toes. On 12-JUL-2009, she experienced retention of urine. A herniated vertebral disc was excluded by MRI: EMG showed no denervation, but reduced interference pattern. Nerve conduction velocities of both peroneal nerves were normal. The patient recovered spontaneously from urinary retention, but not from pareses and hypoaesthesia and the outcome of lumbago was unknown. Lumbago, hypoaesthesia, pareses, urinary retention and condition aggravated were considered as other important medical events by the reporter. Other business partner numbers include: E2009-06099.

Other Meds: hormonal contraceptives (unspecified)

Lab Data: electromyography, 12?Jul09, no denervation; magnetic resonance imaging, normal

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain, Arthralgia, Bradycardia, Fall, Nausea, Pulse pressure decreased, Shock, Syncope

Symptom Text: Information has been received from a health authority (case number 101317) through a foreign agency (local case number IT303/09) concerning a 15 year old female patient who on 14-JUL-2009 was vaccinated with the first dose of GARDASIL intramuscularly, site of administration was not reported. There was no concomitant medication. Two minutes after vaccination on 14-JUL-2009, she presented lipothymia with fainting leading to fall and shock of the head and back, abdominal pain, nausea and arthralgia. An ambulance was called and the patient was transported to Emergency Unit, followed by hospitalization then prolonged hospitalization. The patient had blood pressure at 80 mmHg, weak pulse and bradycardia. Clinical control with blood pressure was performed. The patient was lying, received water and sugar and did not require medication. On 14-JUL-2009, the patient fully recovered. Case is closed. Other business partner numbers include: E2009-06093.

MedDRA PT Borrelia infection, Facial palsy

Symptom Text: Information has been received from a general practitioner concerning a 12 year old female patient who on 09-JUL-2009 was vaccinated with the first dose of GARDASIL (Lot # 1113U, batch #NH04240) into the left upper arm and with a first dose of (NEISVAC-C) into the right upper arm. On 09-JUL-2009 in the evening, the patient experienced peripheral facial palsy and was admitted to the hospital. The reporter was contacted by phone on 20-JUL-2009 in order to gather additional information. Meanwhile, CSF exam had revealed borrelia infection. Being aware of this new information, the reporter does no more consider the event being possibly related with the vaccines. Other business partner numbers include: E2009-06088.

Other Meds: Unknown

Lab Data: cerebrospinal fluid culture, revealed Borrelia infection

MedDRA PT Hypoaesthesia facial, Localised oedema, Paraesthesia

Symptom Text: Information has been received from a nurse concerning a 25 year old female who on 13-JUL-2009 was vaccinated with the first dose of GARDASIL, batch # NJ17110/lot # 661046/0695X. On 13-JUL-2009 the patient experienced numbness right side of chin, tingling near the navel and right sided chin edema (there was no redness or skin eruption). On approximately 14-JUL-2009 the patient recovered from numbness right side of chin, tingling near the navel and right sided chin edema (the nurse reported that the symptoms resolved within 12 hours). Numbness right side of chin and tingling near the navel were determined to be important medical events based on foreign agency requirements. No further information is available.

MedDRA PT Alopecia, Alopecia areata, Urinary tract infection

Symptom Text: Information has been received from a gynaecologist concerning a 22 year old female who on 17-JUN-2008 was vaccinated intramuscularly with the first dose of GARDASIL (lot# 1172U, batch# NH13130) into the left arm. Concomitant therapy included MINISISTON. In 2008, on an unspecified date post vaccination the patient developed diffuse hair loss at first, followed by alopecia areata up to generalized hair loss at the time of reporting. Additionally she experienced relapsing urinary tract infections which were treated with antibiotics. Dermatological and endocrinological examination showed no pathologies. Despite ongoing symptoms the patient received a second dose of GARDASIL (lot #1115U, batch# NH33310) on 20-AUG-2008 and a third dose of GARDASIL (lot# 1050U, batch# NH32130) on 12-JAN-2009. At the time of reporting symptoms were ongoing. Hair loss and urinary tract infection were considered to be other medically important condition by the reporter. Other business partner numbers included: E 2009-06129. Additional information has been requested.

Other Meds: MINISISTON

MedDRA PT Vestibular neuronitis

Symptom Text: Case received from a health care professional in country on 20-JUL-2009. It was reported by a pediatrician that a 17-year old (also reported as 18 year old) female patient was vaccinated with a first dose of GARDASIL (Lot:1282U, Batch: NH33500) IM into the upper arm on 06-JUL-2009. On 10-JUL-2009 the patient was hospitalized and vestibular neuronitis was diagnosed. Magnetic resonance imaging (MRI), electroencephalography (EEG) and cerebrospinal fluid culture (CFS) showed normal results. Symptoms improved and the patient was discharged on 17-JUL-2009. At the time of reporting the patient has not completely recovered. Other business partner numbers include E2009-06107.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Acute disseminated encephalomyelitis, Anorexia, Endotracheal intubation, Eye movement disorder, Fatigue, Glasgow coma scale, Grunting, Incontinence, Intensive care, Mutism, Neurological decompensation, Parenteral nutrition, Respiratory disorder

Symptom Text: Information has been received from a resident internist in charge of the patient at the pediatric intensive care unit concerning a 15 year old female who on 13-JAN-2009 was vaccinated with the first dose of GARDASIL (lot# 1883U, batch# NH50490). On 07-MAR-2009 the patient received the second dose of GARDASIL (lot# 1883U, batch# NH47610). The patient had no personal or family neurological history. On 12-JUL-2009, i.e. approximately 4 months after vaccination, the patient presented with a severe fatigue, anorexia and then evolved to mutism. Afterwards, she experienced sphincterian disorders, then neurological and respiratory deterioration associated with a collapse of Glasgow coma scale. The patient was intubated for 72 hours. Magnetic resonance imaging (MRI) was performed on 20-JUL-2009. Acute disseminated encephalomyelitis was diagnosed. On 23-JUL-2009, the patient presented a complete deficit of lower limbs, a complete mutism associated with a few gruntings, and an inconstant tracking eye movement. The patient was treated with antibiotics. She was initially treated with ZOVIRAX, but the treatment was stopped due to lack of arguments in favour of herpetic infection. The patient was under parenteral alimentation. According to the internist, the usual causes for acute disseminated encephalomyelitis were vaccine or viral infection. The patient should have received the third dose of GARDASIL 15 days before the first clinical signs. However as the vaccine was not administered, "Vaccine etiology" was consequently ruled out. Results for viral serologies were expected. To be noted that the case was initially reported to the sales representative by a gynecologist who told her about a 15-year-old female patient who was "between life and death" after receiving the third dose of GARDASIL. At the time of reporting, the patient had not recovered. Other business partner numbers include E200906299.

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse via CSL as part of a business agreement for the pregnancy Registry for GARDASIL, concerning a 17 year old female with no pertinent medical history, any risk factor (no diabetes, hypertension, no alcohol or smoker) and any history of previous pregnancies, who on 05-MAY-2009 was vaccinated with a dose of GARDASIL (Lot: 1697U, Batch: NH48330) while she was three weeks pregnant (last menstrual period: 14-APR-2009 and her estimated delivery date was 22-JAN-2010). Additional information has been received from the nurse who informed that the patient has voluntary terminated her pregnancy. The nurse reported that the outcome had nothing to do with GARDASIL (administration. At the time of reporting on 20-JUL-2009, the patient's status was unknown. Upon internal review voluntary terminated pregnancy was considered as other important medical event. Additional information is not expected.

MedDRA PT Swollen tongue, Urticaria

Symptom Text: Patient received Gardasil immunization at approximately 12:15 pm. Stayed at doctor's office for 20 minutes following the immunization. At approximately 1:30 pm received call from patient's mother stating she was having a swollen tongue and hives on the right side of her face. Patient has history of significant allergies. Requested that mom give patient benadryl and to monitor for changes. Patient's mom was instructed to use epi-pen and call 911 if the patient's symptoms did not improve after benadryl.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Caesarean section, Drug exposure during pregnancy, Foetal disorder, Streptococcal identification test positive

Symptom Text: Information has been received from a Registered Nurse (R.N) and a Physician for the pregnancy registry for GARDASIL concerning a 17 year old female patient who was a heavy smoker, with anemia during her pregnancy which was treated with oral iron supplements who in March 2008 (also reported as almost 2 years ago) was vaccinated with the first dose of GARDASIL (Lot # not reported). Concomitant therapy included prenatal vitamins (unspecified) and FLUVIRIN. It was reported that the patient became pregnant. The patient's last menstrual period (LMP) was 10-SEP-2008 and her estimated date of delivery (EDD) by LMP was 17-JUN-2009, however was corrected to 08-JUN-2009 by early ultrasound. On 01-JUN-2009 (at 39 weeks gestation) the patient delivered a female neonate weighing 2690 gm/5lb and 15 ounces by C-section for non-reassuring fetal heart rate. The patient tested positive for group B strep and was treated with intravenous ((IV) antibiotics (name not provided) during labor. The baby's apgar scores were 7 at one minute, 8 at five minute and 9 at ten minute. It was reported that two days after birth, prior to discharge home, the baby was transferred to a Neonatal Intensive Care Unit (NICU) for a seizure like episode (not further specified). The physician did not have any record of the baby's exact or final diagnosis. He did note that the baby was not hospitalized for a long period of time and did not believe she was on any medication. The patient's last menstrual period was on 10-SEP-2008 and her estimated delivery date was on 08-JUN-2009 which was corrected by early ultrasound. Upon internal review, C-section for non reassuring fetal heart rate was considered to be an other important medical event. Additional information has been requested.

Other Meds: vitamins (unspecified)

Lab Data: Apgar score, 06/01/09, 7, at the first minute; Apgar score, 06/01/09, 8, at 5 minute; Apgar score, 06/01/09, 9, at 10 minute; vaginal Streptococcus, positive

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Dizziness, Grand mal convulsion, Loss of consciousness, Pallor, Syncope, Tremor

Symptom Text: Information has been received from a registered nurse concerning a 16 year old female patient with a history of acne and no known drug allergies who on 27-JUL-2009 was vaccinated with a dose of GARDASIL (Lot: 661954/1496X). The patient did not receive any concomitant vaccines when the GARDASIL was administered to the patient. Concomitant therapy included tetracycline. There were no concomitant vaccines. On 27-JUL-2009, within five minutes of receiving GARDASIL, the patient became light headed, fainted and passed out while sitting in the waiting room with her mother. Her left arm had seizures movement and her right arm had slight seizure movement, the patient had a tonic-clonic seizure which lasted for 2 to 3 seconds. The patient abruptly awoke. The patient had not eaten prior to the physician's visit and prior to the GARDASIL vaccination. The nurse stated that the patient was given something to eat and drink after the incident had occurred. The patient was white and shaky for a while. On the same day, 27-JUL-2009, the patient recovered. The Registered nurse did not consider the patient's experience to be disabling or life-threatening. The registered nurse stated that she spoke with the patient's mother via a telephone call on 27-JUL-2009 and 28-JUL-2009. The patient's mother stated that the patient "was doing fine". Upon internal review tonic-clonic seizure was considered as other important medical event. Additional information has been requested.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Fatigue, Incorrect route of drug administration, Injection site pain, Myalgia, Nausea, Paraesthesia

Symptom Text: Information has been received from Health Authority under reference: 2009-02868, concerning a 20 year old female patient with no pertinent medical history reported, who was vaccinated with 0.5ml first dose of GARDASIL (lot number: 1647U, batch number: NJ02280) via subcutaneous route (instead of intramuscular as recommended) on 06-MAY-2009. On the same day, she developed myalgias in the left upper limb associated with exquisite pain at the injection site. Two weeks after vaccination, the patient also developed paresthesias of the left hand. She received DAFALGAN and NSAID's as corrective treatment, without notable effect, the NEURONTIN which was stopped due to the appearance of fatigue and nauseas. There was no local reaction, i.e. no tumefaction, no redness, no pruritus. Two months after vaccination the myalgias and paresthesia still persisted without improvement. The Health Authorities considered the causal relationship with the vaccine as possible for the myalgias and paraesthesias and probable for the injection site pain. The reporter considered the patient's experiences to be disabling. Other business partner number is included E2009-06472. No further information is available.

Seriousness: ER VISIT, HOSPITALIZED, LIFE THREATENING, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abdominal discomfort, Activities of daily living impaired, Alopecia, Anaemia, Asthenia, Autoimmune disorder, Blood product transfusion, Contusion, Cough, Dizziness, Ear pain, Evans syndrome, Haemolytic anaemia, Headache, Hyperhidrosis, Idiopathic thrombocytopenic purpura, Musculoskeletal stiffness, Neutropenia, Oral contraception, Pallor, Palpitations, Petechiae, Platelet count decreased, Poor quality sleep, Pruritus, Pyrexia, Red blood cell count decreased, Tanning, Thrombocytopenia, Urticaria, Vaginal haemorrhage, Viral infection, Vision blurred, Wheezing, White blood cell count decreased

Symptom Text: Was doing fine after first after first shot, received 2nd series and next day went to dr. from school complaining of blurred vision, sick to stomach, and bad headache, fever and heart palpitations. Felt like was going to pass out. Went to dr. had tests and was in bed for 3 days. Blood tests came back low.. White, red and platelets.. Told 2 wait and be tested again in a few weeks. When tested again was sent to hospital and then diagnosed with ITP Syndrome and given medication.. Did not work, so then was hospitalized because blood was so low at serious risk for a stroke, was given another dose of globin and spent night at hospital.. A few weeks later, took blood tests again everything was still low, was put on highest dosage of Prednisone 4 3 weeks.. Blood levels raised and stabilized 4 a few weeks.. Latest has been diagnosed with ITP/Evans Syndrome and told would probably turn into Lupus, will have to visit hospital on a regular basis to be monitored.. A permanant disease, Rheumatologist and blood disorder doctors from 2 major hospitals agree this illnes was created by the Gardasil Vaccine and written in their reports. 8/10/09 PCP medical records received DOS 1/2/09 to 3/18/09. Assessment: Low platelet count. Hives/urticaria thighs and lower legs, itching after tanning session. Has started oral contraceptives. Heart palpitations, nausea, feverish. Headache, ears hurt, lightheaded. Looks pale. Excused from PE. 8/10/09 Hospital records and Oncology/Hematology consult, Rheumatology Consult, DOS 4/9/09 to 4/27/09. Assessment: Thrombocytopenia, anemia, neuropenia, positive lupus anticoagulant, elevated PT/PTT. Patient presents with thrombocytopenia, anemia, excessive vaginal bleeding. Had bad 'virus' with fevers, cough, headache, poor sleeping and sweating. Missed school. IVIG therapy. Hair is falling out. Energy levels decreased, pale, diffuse bruises, petechia over lower legs. Tightness in neck. Wheezing. 8/10/09 Hematology consult - second opinion, Rheumatology report DOS 4/21/09 to 5/19/09. Assessm

Other Meds: None

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 17 year old female with penicillin allergy, easy bruiser, "ear tubes" and a history of dental extractions was vaccinated with a first dose of GARDASIL (lot# 661703/0651X) IM in the left arm on 02-Jan-2009. No other medications. The patient was doing fine after the first shot. She received the second series and on the next day, 11-MAR-2009, went to doctor from school complaining of blurred vision, sick to stomach and bad headache, fever and heart palpitations. Felt like was going to pass out. She went to doctor and had tests and was in bed for 3 days. Blood tests came back low, white, red and platelets. She was told to wait and be tested again in a few weeks. When tested again, she was sent to hospital and then diagnosed with ITP syndrome and was given medications. Did not work, so then was hospitalized because blood was so low, at serious risk for a stroke. She was given another dose of globin and spent night in hospital. A few weeks later, she took blood tests again, everything was still low, and she was put on highest dosage of prednisone for 3 weeks, blood levels raised and stabilized for a few weeks. Latest has been diagnosed with ITP/Evans Syndrome and she was told would probably turn into lupus. She would have to visit hospital on a regular basis to be monitored. A permanent disease, rheumatologist and blood disorder doctor from 2 major hospitals agree this illness was created by GARDASIL and written in their reports. On 10-AUG-2009, PCP medical records received 02-Jan-2009 to 18-MAR-2009. Assessment: low platelet count, hives/urticaria thighs and lower legs, itching after tanning session. She had started oral contraceptives. Heart palpitations, nausea, feverish, headache, ears hurt, lightheaded, looks pale. She was excused from PE. On 10-AUG-2009, hospital records and oncology/haematology consult and rheumatology consult from 09-APR-2009, to 27-APR-2009 was received. Assess

MedDRA PT Abdominal discomfort, Activities of daily living impaired, Alopecia, Anorexia, Arthralgia, Asthenia, Burning sensation, Chest pain, Crying, Fatigue, Gait disturbance, Hypotonia, Lethargy, Muscular weakness, Musculoskeletal pain, Nausea, Nuclear magnetic resonance imaging normal, Pain, Pyrexia, Sleep disorder

Symptom Text: 7/22 Woke up during the night from a really bad sharp pain in chest. She barely touched it and the sharp pain would return same with shoulders. 7/22 Tired and sore from therapy. I want to give a little history on this patient. She was a cheerleader, majorette, and was in a weight lifting class. She was very active and athletic. I didn't have enough room on the VAERS for this so I am attaching this sheet for a timeline. 10/14/08 1st GARDASIL. 12/29/08 2nd GARDASIL. 01/09 School reported she was generally weak and fatigued to the point of needing to leave school. 02/09 She started with having leg weakness and would like wrap her ankles for performances and practices (no injuries) just weakness. 03/09 The actual leg and joint pain started. She was refusing to do stunts in cheerleading because it hurt so bad. She is the "flyer" because of her small size and she said it hurt too bad to climb up and to be caught. 04/09 Not a lot of activity during the month with cheering or anything, but she had to be picked up from school several times because the exertion just from walking from class to class made her so tired she had to go to bed. 05/09 The week of the 11th she had to be picked up from school because of lethargy just from decorating for the prom. The week of the 18th she started with a limp more prominent in the R leg. Substantially increased pain in the joints and "shooting, needle-stick pains in the shin area". The following week she started losing muscle control and could not walk or stand without help and started using crutches. She complained of "burning, stabbing, achy" pains in many different areas. Her hips, arms, and leg muscles had significantly increased pain. Because of the severity of the pain and loss of muscle control in her legs, she was taken to ER on May 31. She was sent to hospital at that time. 06/09 She went to an Orthopedic Dr and they said it was neurological. She started seeing a Neurologist, she was doing MRI's and further testing and they couldn't find anything so they are sending her to a

MedDRA PT Caesarean section, Drug exposure during pregnancy, Haemorrhage, Oedema, Pre-eclampsia, Pregnancy induced hypertension, Vaginal haemorrhage

Symptom Text: Initial and follow-up information has been received from a nurse, for GARDASIL, a Pregnancy Registry product, concerning a 23 year old female who on 07-JAN-2008 was vaccinated with the first dose of GARDASIL (lot# 659439/1267U, IM, 0.5ml). On 12-JUN-2008 the patient received the second dose of GARDASIL (lot# 660391/0063X, IM, 0.5ml). Concomitant therapy included LEXAPRO. After the second dose the patient was pregnant and her last menstrual period (LMP) date was at 15-AUG-2008. On 26-SEP-2008 the patient experienced pre-eclampsia and spotting/bleeding; intervention was observation. Lab diagnostics studies included ultrasounds-normal, fetal echocardiogram at 37 weeks-normal, urine protein test-normal. On 08-MAY-2009 the patient was admitted for delivery at hospital. The patient did experience "pregnancy induced hypertension" at delivery, but hospitalization was not prolonged due to this event. The baby boy (8lb 4oz) born with no complications. The patient was seen in the office on 21-JUL-2009, blood pressure (B/P) was normal (120/72) at that visit. The patient had not yet received the 3rd dose of GARDASIL. At the report time the patient's status was unknown. In follow-up, a nurse reported the 23 year old white female had no previous pregnancies. Her concurrent medical conditions were reported as "stable". Other medication used during her pregnancy included precare vitamin (the date of use was reported as "25-SEP-2009"). Her pregnancy was complicated by pregnancy-induced hypertension and she developed edema. Subsequently, on 09-MAY-2009, the patient delivered a normal male baby by C-section delivery weighing 8 pounds 4 ounces. The baby had no congenital anomalies or any other complications or abnormalities. No further information is available.

MedDRA PT Abasia, Back pain, Cerebellar syndrome, Chest pain, Epidural anaesthesia, Hyperreflexia, Insomnia, Multiple sclerosis, Muscle twitching, Muscular weakness, Neck pain, Oedema peripheral, Pain in extremity, Paraesthesia, Peripheral coldness, Skin discolouration, Tongue paralysis

Symptom Text: Information has been received from a physician concerning a female who in January 2009, was vaccinated IM with the second 0.5ml dose of GARDASIL (lot# not reported). The patient exhibited "multiple sclerosis (MS)-like symptoms". The date of onset of the symptoms was unknown. The patient was hospitalized overnight at hospital for testing to rule-out multiple sclerosis. The physician relayed that unspecified test results were "non-specific". The dates of hospitalization were unknown. The physician did not provide details of the specific symptoms experienced by the patient but added that "the symptoms are improving." Follow up information was received via telephone call from the patient's mother who worked in the doctor's office and was not a Health Professional provided the patient's full name and birth date. It was reported that the patient was 23 year old and had received 2 doses of GARDASIL. The patient received the first dose of GARDASIL from her gynecologist (GYN) physician (date, dose and lot number unknown to reporter). The patient received the second dose of GARDASIL on 12-NOV-2008 (lot# 659184/0843X) (previously reported as January 2009). The patient began having the following symptoms in the middle of December 2008; "Swelling in her arm, twitches, constant back pain, could not walk at times". The patient was hospitalized of over night, early in 2009 to rule out (R/O) multiple sclerosis (MS) (hospital name and hospitalization dates not reported). The patient's mother stated that the patient could walk and was improving. Follow up information was received via telephone call from a person from the patient's gynecologist's office who provided the doctor's address and reported that the patient received the first dose of GARDASIL on 05-MAY-2008 (expiration date 14-JUN-2009). Additional information has been requested. 8/7/09 Medical records received DOS 11/12/08 to 7/28/09. C/O heartburn, rosacea, joint stiffness. Second dose of Gardasil administered. MedDRA PT Drug exposure during pregnancy, Neonatal disorder

Symptom Text: Information has been received from a physician and a certified medical assistant, for GARDASIL, a Pregnancy Registry Product, concerning her 17 year old niece no pertinent medical history and no known allergies who on 14-NOV-2007 was vaccinated (injection) with a first dose of GARDASIL (lot# (lot# 659437/1266U) a second dose on 16-JAN-2008 (lot# 659439/1267U), and a third dose was administered on 21-MAY-2008 (lot# 660389/1968U). There was no concomitant medication. In June 2008 the patient found out she was pregnant. The patient then had her baby in March 2009 and the baby was born with brain swelling. The baby then had surgery (name of hospital, address and phone number unspecified) to have the fluid around the brain drained and once the fluid was drained the physician noticed that the baby's brain was not fully developed in the frontal cortex. The certified medical assistant reported that the patient and baby were under care with the patient's Obstetrician/Gynecologist (OBGYN). The patient's last menstrual period (LMP) was reported as "around June 2008". The patient was determined to be pregnant in December 2008 when she was 6 months gestation. The patient delivered a male infant on 23-MAR-2009. The infant was diagnosed with hydranencephaly at birth (also reported by the physician as 2 months after birth). Unspecified medical attention was sought. At the time of the report, the patient had not recovered. The physician reported that she was unsure about the patient's prenatal care. Follow up information was received on 28-JUL-2009 via telephone call from a registered nurse who reported that concomitant therapy included MENACTRA (lot# U2538AA) and influenza virus vaccine (unspecified) (lot# U2475KA). The nurse confirmed that there was no pertinent medical history and no known drug allergies (NKDA) and the only therapy taken by the patient was pm naproxen for menses. The nurse was not certain, but believed it was the patient's first pregnancy. LMP date and length of gestation were not available from the nurse's of

MedDRA PT Arthralgia, Condition aggravated, Injection site pain, Streptococcal infection

Symptom Text: Case received from a health care professional on 21-JUL-2009 and additional information on 24-JUL-2009. It was reported by a physician that a 15 year old female patient was vaccinated with a second dose of GARDASIL (Lot: 1316U, Batch: NH24910) IM into the left upper arm on 14-JUL-2009. On 16-JUL-2009 the patient developed pain at the injection site and pain in elbow of the vaccinated arm (left). On 18-JUL-2009 severe pain in both knees started. Treatment with Diclofenacnatrium showed no improvement. Pain increased during the night. Therefore the patient was hospitalized on 20-JUL-2009. A blood sample was taken and showed increase values for serum C-reactive protein test (CRP), leukocytes and erythrocyte sedimentation rate. Further diagnostics were carried out at the time of reporting. The result of the laboratory values showed an increased antistreptolysin titer. The diagnosis of post streptococcal infection was established. Under treatment with naproxen the symptoms were resolving. Further diagnostic investigations with regard to rheumatic diseases were intended. The patient developed pain in elbow of vaccinated arm (left) after received the first dose of GARDASIL (Lot: 1115U, Batch: NH33310), on 12-MAY-2009 and recovered completely within an unspecified time. Other business partner numbers include E2009-06171.

Other Meds: Unknown

Lab Data: diagnostic laboratory test, 20?Jul09, showed an increased antistreptolysin titer; WBC count, 20?Jul09, increased values; serum C-reactive protein, 20?Jul09, increased values; erythrocyte sedimentation rate, 20?Jul09, increased values

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Cervical dysplasia, Cervicitis, Papilloma viral infection

Symptom Text: Case received from a general practitioner on 03-JUL-2009 who transmitted through a sales representative. The physician was called: A 19-year-old female patient under oral contraceptive received the three doses of GARDASIL (lot# and batch # not reported) respectively on 01-FEB-2008, 21-APR-2008 and 09-AUG-2008. On 09-FEB-2009, an abnormal pap smear revealed a malpighian lesion CIN2. A colposcopy was performed which showed an iodo-heterogeneous lesion at the level of the posterior lip of the cervix uteri. A biopsy showed a dysplasia of the cervix uteri, associated to human papillomavirus lesion. There was no information concerning the human papillomavirus typing. The patient was treated with miniconization. To be noted that the reporter had doubts about the patient's date of first sexual intercourse (after or before completing GARDASIL vaccination schedule; 3 doses), because the patient was already under oral contraceptive when she received GARDASIL. Information received through PV form on 28-JUL-2009 and Anatomy and Pathological Cytology reports: Case upgrade to serious as the patient was hospitalized. The patient had received the first dose of GARDASIL via intramuscular route in the left deltoid respectively on 01-FEB-2008 (lot # 0484U, batch # NG29160), 21-APR-2008 (lot # 0588U, batch # NG34100) and 09-AUG-2008 (lot # 1282U, batch # NH47590). On 09-MAR-2009 (instead of 09-FEB-2009 as previously reported), she experienced a dysplasia of the cervix uteri CIN2. She was treated with miniconization on 06-MAY-2009. High grade (CIN2) malpighian intraepithelial lesion associated to human papillomavirus lesion (without typing) was diagnosed. The reporter mentioned that the patient was hospitalized (no other precision). Anatomy and Pathological Cytology report on 09-MAR-2009: Cervical smear was performed. The report concluded to a cytological aspect in favor of high grade (CIN2) malpighian intraepithelial lesion. Biopsies under control colcoscopic were recommended. Anatomy and pathological cytology report on 12-MAY-2009;

Other Meds: Hormonal contraceptives (unspecified)

Lab Data: Colposcopy, 09Mar09, showed an iodo-heterogeneous lesion at the level of the level of the posterior lip of the cervix ute; Cervical smear, 09Mar09, cytological aspect in favor of high grade (CIN2) malpighian intraepithelial lesion; Diagnost

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Headache, Myalgia, No reaction on previous exposure to drug, Photophobia, Pyrexia

Symptom Text: Information has been received from a health authority concerning a female of unknown age. The patient had received the first two doses of GARDASIL on 12-FEB-2007 and an unspecified date with no adverse effect. The patient received the third dose of GARDASIL (batch number not reported, intramuscularly), on 26-SEP-2007. On 26-SEP-2007, the same day as vaccination, the patient experienced a high temperature (39 C) with headache, muscle pain and mild photophobia. The patient recovered after 8-10 hours on 27-SEP-2007. The patient received all three doses of the vaccine and the reaction only occurred after the third dose. There was no confirmation of diagnosis and there was no other reason for the high fever which resolved so quickly. The reporter considered the events to be medically significant. Other business partner's numbers included: E2009-06802 and ADR 20185610. No further information is available. The case is closed.

Seriousness: ER VISIT, HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Asthenia, Balance disorder, Cognitive disorder, Confusional state, Demyelination, Diplopia, Hypoaesthesia, Hypoaesthesia facial, Hypoaesthesia oral, Multiple sclerosis, Visual acuity reduced

Symptom Text: Approximately 1 month after receiving the second dose of the Gardasil vaccine (manufactured by Merck - I am unable to load that in the information section below), I began experiencing numbness in my right leg. The numbness was persistent and progressive - it began in the right leg, but soon spread to the left leg, as well as my face and tongue. I also experienced poor balance, poor vision, confusion, and overall weakness. I was admitted to the hospital 3 weeks later, and kept for one week while receiving intravenous corticosteroids as treatment. 8/24/09 consultant records 1/09-received for numbness of right leg below knee right face and tongue numbness between Oct 07 and Feb 08 when symptoms improved and then in March 08 recurrent symptoms. Developed diplopia, dizziness, cognitive impairment, abdominal problems and fatigue. Impression: MS. JC Virus DNA, QN RT-PCR <500. ```MR and DC summary received 01/27/10 for DOS 11/08/07-11/12/07. DX: central nervous system demyalinating disease, likely MS. Pt presented with progressive paresthesias and gait difficulties. Pt underwent MRI and CSF testing and it was abnormal. Tx: Solu-Medrol. Pt L extremities improved mobility and walking. Pt had notable diminished propriception in the R lower extremity and prominent heel strike walking, but they improved at discharge time. Pt to follow up with neurologist.

Other Meds:

Lab Data: A multitude of blood tests were done, along with MRIs, x-rays, and a lumbar puncture 8/24/09-records received-JC Virus DNA, QN RT-PCR <500. ```Lab and DX studies: MRI: abnormal with small subcortical lesions. CSF: no infection.

History: ```PMH and allergies: none.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse (R.N.), for the Pregnancy Registry for GARDASIL, concerning a 22 year old female who was intramuscularly vaccinated with the first and second 0.5 ml doses of GARDASIL (first lot #0151X, second lot #0250X) on 28-APR-2008 and 30-JUN-2008, respectively. The patient had 3 previous pregnancies and 2 elective terminations. Subsequently, the patient discovered that she was pregnant. Her LMP was 15-JUN-2008. On 03-SEP-2008, she had ultrasound and "the results were normal and she was 12 weeks gestation at that time". On 13-OCT-2008, she had serum alpha-fetoprotein test and the result was normal. No adverse effects reported. The patient sought medical attention via office visit. Additional information was received from a physician via Initial Pregnancy Questionnaire. The physician reported the patient had 3 previous pregnancies and 2 elective terminations. The patient's LMP was 15-JUN-2008 and estimated delivery date was 02-MAR-2009. The result of patient's serum alpha-fetoprotein test was normal on 13-OCT-2008. Follow up information was received via pregnancy questionnaire indicated that the patient delivered a normal male baby on 05-MAR-2009, 38-39 weeks from the patient's LMP, weighting 9.1, length 21 inches. There was no congenital anomalies, complication, infections or illnesses during pregnancy and no complication during labor/delivery. It was also noted that the patient took VITAFOL during this pregnancy. Follow up information was received which reported the patient with G3P0 on 05-MAR-2009 underwent C-section. The baby was well health. Upon internal review, the C-section was determined to be an other important medical event. Additional information is not expected.

Other Meds: Unknown

Lab Data: ultrasound, 09/03/08, results were normal and 12 weeks gestation; serum alpha-fetoprotein, 10/13/08, normal

MedDRA PT Faecal incontinence, Hypoaesthesia, Multiple sclerosis, Sensory disturbance, Urinary incontinence, Urticaria, Vertigo

Symptom Text: Information has been received from a consumer concerning his 25 year old god-daughter who, 4 or 5 months ago, in approximately February 2009, was vaccinated with her first dose of GARDASIL (route and site not reported). About a week later the patient experienced numbness on her lower body. When the patient sought medical attention, she underwent MRI and other various tests and the doctors diagnosed her with multiple sclerosis (MS). At the time of reporting the patient's multiple sclerosis persisted. Upon internal review, multiple sclerosis was considered to be an other important medical event. This is one of several reports received from the same source. Additional information has been requested. 10/2/09 Medical records received for Neurologist consultation for dates of service 6/30/09 and 7/15/09. DX: MS. Presenting symptoms: initial episode of left arm and leg numbness and hives 1 day after gardasil vaccination. Later 5/09 episode numbness from navel down, abnormal sensation in both legs, bowel and bladder incontinence, later resolved. Vertigo.

Other Meds: None

Lab Data: magnetic resonance; diagnostic laboratory, various tests for MS 10/2/09 Medical records received for Neurologist consultation for dates of service 6/30/09 and 7/15/09 Diagnostics/Lab: MRI abnormal- 3 areas of demyelinization. MRI cervical

MedDRA PT Abasia, Abdominal pain, Acne, Anal fissure, Attention deficit/hyperactivity disorder, Autoimmune disorder, Bacteria urine identified, Biopsy kidney, Blood albumin decreased, Blood iron decreased, Blood urine present, C-reactive protein increased, Chest pain, Constipation, Contusion, Cough, Cryoglobulins present, Dysmenorrhoea, Haematochezia, Henoch-Schonlein purpura, Herpes virus infection, IgA nephropathy, Immunology test, Insomnia, Joint swelling, Kidney fibrosis, Nephritis, Oedema peripheral, Oral contraception, Orthostatic proteinuria, Pain, Pain in extremity, Peripheral coldness, Platelet count increased, Pneumonia, Polymerase chain reaction, Premenstrual syndrome, Protein total increased, Protein urine present, Pyrexia, Rash, Rash pustular, Red blood cell count decreased, Red blood cell sedimentation rate increased, Renal impairment, Sunburn, Temperature intolerance, Tendon injury, Urinary sediment present, Urinary tract infection, Viral upper respiratory tract infection, Vomiting, Wheezing, White blood cell count decreased

Symptom Text: 48 hours after the vacination of Gardasil, I has a reaction. My legs swelled and I had small red bumps all over my legs. I couldn't walk because of the pain and large amout of swelling in my knees and ankles. About 8 days after I had severe abdominal pain with vomiting and fever. I went to the doctor about a week after the shot because my legs were swelling all over and so were my elbows. The dots were spreading and they stung. She looked and examined me and we concluded I had HSP. It's an autoimmune desease that causes the blood veins to pop and leak. It is supposed to go away after 4-8 weeks. I have had it since Sep. 11th of 2008. We went to a skin doctor to make sure and he took a biopsy of my leg in 2 places and it was in fact HSP. About a month or 2 after we found out what I had, we started noticing I got sick very easily. I had my blood and urine tested and the doctors saw that I had an extremely high level of protein and blood in my urine. In the blood they took they saw that my iron was low and I had a low white blood cell count. We kept testing one or twice every 2 or 3 weeks. The protien and blood went up and down but was never at a normal or healthy amount. We then went to a doctor. He looked at my urine and blood and decided to preform a kidney biopsy. He saw that I had scarring on my kidneys and found that I have an IgA protien that causes my kidneys to overwork. I was put on blood pressure medicine and bottomed out so we stopped that. We are still to this day trying to find out what to do about the situation. We've also been to an allergist. She saw that the ingredients in Gardasil along with the protien in my body are reacting. I can't take any medication because I might have a reaction. Plus it goes to my kidneys which could cause damage. I might be put on steroids but we aren't sure. I just hope more people know about Gardasil before someone else gets what I have or worse. 8/17/09 PCP medical records received DOS 8/12/08 to 7/13/09. Assessment: Henoch-Schoenlein Purpura. Patient presents wit

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Neuropathy peripheral, Vaccine positive rechallenge

Symptom Text: Information has been received from a Health Authority (ref. # 2009-02926) concerning a 16 year old female patient with no pertinent medical history reported who on 30-MAR-2009 was vaccinated with the first dose of GARDASIL (Lot # 0160X and Batch # NJ30960) intramuscularly into her left arm. On 03-APR-2009, she developed a neuropathy of the right arm. She received the second dose of GARDASIL (Lot # 1648U and Batch # NH55600) via intramuscular route on 08-JUN-2009. In the following days she developed a neuropathy of the right leg. Laboratory work-up was complete and without particularity. A MRI was planned. There was no other information. At the time of reporting, the patient had not recovered. The Health Authorities considered that causal relationship between neuropathy and the vaccination as possible in the absence of other etiologies. A corrective version was created on 31-JUL-2009 to rectify the batch number of the first dose (NJ30960 instead of NJ20960). The primary reporter considered neuropathy to be significant disability/disabling. Other business partner numbers include: E2009-06530. No further information is available.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Bladder diverticulum, Cystitis haemorrhagic, Haematuria

Symptom Text: Information has been received from a physician concerning a 26 year old female without mentioning anything about her past medical history who on 15-AUG-2008 and 06-NOV-2008 was vaccinated IM 0.5 mL with the first and second dose of GARDASIL (lot# not reported), respectively. Concomitant therapy was not reported. At 14 days after the second dose (on 20-NOV-2008), the patient developed hematuria and after echography and urography it was established Vesical (urinary bladder) diverticulum diagnose. The events of hemorrhagic cystitis and secondary vesical (urinary bladder) diverticulum required hospitalization. After treatment with CIPRINOL injectable 1 vials at 12 hours and amikacin injectable 1 vials at 12 hours in period 20-NOV-2008 to 04-DEC-2008, given for hemorrhagic cystitis and secondary vesical diverticulum, the symptomatology - hematuria remitted. On 15-DEC-2008, the patient recovered from hemorrhagic cystitis and secondary vesical (urinary bladder) diveritculum and on an unspecified date was discharged. The action taken with GARDASIL was reported as discontinued. The reporting physician felt that hemorrhagic cystitis and secondary vesical (urinary bladder) diveritculum were related to therapy with GARDASIL, as there was no any other reason for above described adverse events. Additional information is not expected.

Other Meds: Unknown

Lab Data: abdominal ultrasound, ??08, image suggesting vesical (urinary bladder) diveritculum; urinary system X-ray, ??08, image suggesting vesical (urinary bladder) diveritculum; urine culture, 20Nov08, negative; sterile

Symptom Text: Information has been received from a consumer concerning her 16 year old daughter allergy to cinnamon and with a history of an allergic reaction (eye redness) to neomycin (manufacturer unknown) who in August 2007, was vaccinated with first 0.5mL dose of GARDASIL (route and lot number not reported). There was no concomitant medication. After a couple of days the patient experienced severe joint pain that she could not get up from bed and was unable to walk. Patient was given steroid injection in her feet and knees and for almost a year she was in wheel chair. The patient was given the second dose of GARDASIL (route and lot number not reported) in August 2008 and in November 2008, she was diagnosed with "polyarticular JIAR (Rheumatoid arthritis)". The patient's mother also stated that her daughter had abnormal cervical cells and small vaginal lesion. The patient's mother stated that soon her daughter will be getting steroid injection on her hands because she is unable to lift them. At the time of reporting the patient had not recovered from the events. Upon internal review polyarticular JIARS+ (Rheumatoid arthritis) and unable to walk were considered to be disabling. Additional information has been requested. 8/24/09 Consultant records received DOS 8/20/08 to 8/4/09. Assessment: Enthesopathy, amplified musculoskeletal pain. Polyarticular JIA RF(+). Patient with acquired acanthosis nigrans and obesity presents with knee, foot and neck pain. 'Walks like a duck'. Feet swollen. Nighttime awakenings secondary to pain. Stressed. Enthesitis multiple sites lower extremities and back. Torn medial menisc knee. Joint effusion. Anemia. Moodiness, anger and bruising. Joint stiffness. Feet turn blue. Wheezing. Pneumonia. Shoulder pain. Limp.

MedDRA PT Abdominal pain upper, Abdominal tenderness, Activities of daily living impaired, Arthralgia, Asthenia, Diarrhoea, Disturbance in attention, Excoriation, Fatigue, Feeling abnormal, Headache, Nausea, Oropharyngeal pain, Pain, Photophobia, Viral infection

Symptom Text: On 11/16/08, pt went about her day as normal, but became very tired quite suddenly around 5:00 in the evening. She went to bed to rest (something she rarely did until this point). After a couple of hours we attempted to wake her to attend church, a favorite activity, and she wanted to continue sleeping. We let her sleep until the next morning. We made her get up and prepare for school, but before she left, she complained of tiredness, headache, and sore throat, and we allowed her to stay home from school. She remained in bed for ten days, only getting up to go to the bathroom, shower, or go to the doctor. We encouraged her to sit up in a chair or even lie down in another room to help increase her energy level, but she did not have the strength for more than a few minutes. During this time the headache and sore throat remained, along with upper abdominal pain (left side right under ribs). The symptoms gradually improved, and pt was much better by the end of the first week of December. From then until the middle of January, pt continued to report mild symptoms, including fatigue and abdominal pain, but she was able to go about her normal activities. In mid January, pt came home from school, went to bed, and would not get up until morning. She went to school the remainder of that week with moderate symptoms, only because she was taking mid-term exams. Since then, pt has had three more occurrences of symptoms, missing one and two days of school. During these periods she has complained that light hurts her eyes. Upper abdominal pain, headaches, and sore throat recur periodically. Pt has also complained of periods of "feeling out-of-it", or not being able to concentrate at different times since mid-December. She has also stated that her legs "fall asleep" often. To the best of my knowledge, she has never had fever during this time. In July she received five injections (HPV/Meningitis/DPT/Varicella/HepA), and two in October (HPV/Influenza). Lot number for July 2008 HPV vaccine was 1757U.

Other Meds:

Lab Data: Lab tests performed, all with normal results: Monospot, EBV titers, CBC, urinalysis, pancreatic enzymes. Many other blood tests with normal results. Biopsy performed during endoscopy in June 09 showed mild chronic gastritis. Two abdominal

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Aura, Blindness, Catatonia, Convulsion, Reaction to previous exposure to any vaccine

Symptom Text: Information has been received from a physician concerning a female with a history of experiencing aura of blindness and prevaccination anxiety after previous vaccines (unspecified which ones) and no known drug allergies, who on an unspecified date was vaccinated intramuscularly with first 0.5mL dose of GARDASIL (lot number 659054/0315Y). Concomitant therapy included MENACTRA. "After receiving the vaccine", the patient started experiencing an aura of blindness and proceeded to have a catatonic movement that went into a seizure. The patient recovered shortly after. No lab tests were performed. The patient did not seek medical attention. Upon internal review seizure was determined to be other important medical events. Follow up information was received from a registered nurse. It was reported that the 16 year old female patient has an allergy to Amoxicillin (hives) and a history of the aura of blindness and feeling strange after her vaccination with ADACEL, 3 summers ago (date not provided). The patient's mother reported that her daughter "last time" (3 summers ago) after she got a vaccine, she experienced the aura of blindness after they got out to the car. She did not loose consciousness, but felt really strange. The patient was administered GARDASIL (lot number 659054/0315Y, Expiration date 13-JUL-2010) on 06-JUL-2009. Concomitant medications included ibuprofen PRN and MENACTRA, also given on 06-JUL-2009. The patient was observed in the physician's office saying she was having an aura of blindness, she could not see and then proceeded to become catatonic and the went into a seizure. The registered nurse reported that she recovered shortly after, and was able to go home with no problems. The registered nurse reported that as far as she knows, the patient had not experienced any more seizure activity since 06-JUL-2009. She further noted that as far as she knows, the patient has completely recovered and that she has not called into the office and has not been in to the office since 06-JUL-2009. MedDRA PT Aplastic anaemia, Bone marrow transplant, Chemotherapy, Condition aggravated

Symptom Text: Information has been received from a physician concerning a 21 year old female patient with a history of anaemia in the past detected during blood donation who was vaccinated with a third dose of GARDASIL (lot #, injection route and site not reported) on 20-MAY-2008. In summer 2008 the patient experienced an aplastic anaemia. She was treated with chemotherapy and in November 2008 a bone marrow transplantation was carried out. At the time of reporting the patient had recovered, she was in a good general condition under immunosuppressive therapy. The reporting physician sees a temporal relation to the vaccination. Dose 1 of GARDASIL was administered on 11-DEC-2007 and dose 2 on 29-JAN-2008. No adverse effect was reported. Upon internal review aplastic anemia was considered to be another important medical event. Other business partner numbers include: E200907406. No further information is available.

MedDRA PT Arthralgia, Circulatory collapse, Fatigue, Headache, Laboratory test, Myalgia, No reaction on previous exposure to drug, Pain in extremity

Symptom Text: Information has been received from Health Authority on 31-Jul-2009 under the reference number PEI2009016641. It was reported that an 18-year-old female patient who on 12-APR-2007 was vaccinated in the upper arm with the first dose of GARDASIL (lot# 1341F) and on 14-JUN-2007 was vaccinated in the upper arm with the second dose of GARDASIL (lot# 1341F). Dose 1 and Dose 2 were well tolerated. On 12-FEB-2008, the patient was vaccinated with the third dose of GARDASIL (lot#0277U) into the left upper arm. In the end of Feb-2008 the patient experienced exhaustion, pain in limb, circulatory collapse, myalgia, arthralgia and headache. The patient was hospitalized. Laboratory testing and special heart examinations were carried out. Results not reported. Viral infection was ruled out (no lab findings specified). The patient was treated with azithromycin which lead to a worsening of symptoms. At the time of reporting to HA the patient had not recovered. Other business partner number included: E200907698. MedDRA PT Abdominal distension, Alopecia, Anorexia, Blood test, Constipation, Dizziness, Feeling cold, Feeling of body temperature change, Hot flush, Hypoaesthesia, Malaise, No reaction on previous exposure to drug, Nuclear magnetic resonance imaging, Paraesthesia, Weight decreased

Symptom Text: This case was initially reported to authority by a health care professional on 31-Jul-2009. This case concerns a female patient (age not reported). Details of the patient's medical history and concomitant medication have not been reported. The patient received the first dose of GARDASIL on January-09 without any problems. The patient's sister received the GARDASIL at the same time without any problem. On an unspecified date, but when the dose was due, the patient received the second dose of GARDASIL (batch#, lot#, route and site not reported). On an unspecified date but following the second dose, the patient became very ill for a number of months with hair loss, which was coming out in lumps, weight loss, numbness and tingling in her arm, dizziness, loss of appetite, feeling full and bloated, cold and constipated and hot and cold flushes. The patient underwent a magnetic resonance scan (MRI) and unspecified blood tests (results not reported). The patient outcome is unknown. The patient and her sister refused vaccination with the third dose of GARDASIL. Upon internal review this case has been upgraded to serious due to the events of dizziness, numbness and tingling. Other business partner number included: E200907764. No further information is available.

Symptom Text: Information have been received from the register nurse and a hospital central service technician, for GARDASIL, a Pregnancy Registry product, concerning an 18 year old female patient who on 23-JUN-2009 was vaccinated with a first dose of GARDASIL (lot#661846/1312X, route and site not reported) and a dose of MENACTRA (Sanofi Pasteur, lot#U2872AA). The patient was pregnant, the menstrual period was in May 2009, and the estimated delivery date was 05-Feb-2010. The hospital central service technician who was the patient's grandmother reported that the patient did not want to pregnant and was experiencing multiple relationship problems. "Something happened to her after she became pregnant. She did not sound like herself". On 22-JUL-2009, the patient contacted her grandmother and reported she was hyperventilating. The patient's father took her to the hospital on 23-JUL-2009 and she was admitted. On 24-JUL-2009, the patient was placed in the ICU. On 25-JUL-2009, she was transferred to the crisis unit. The grandmother visited the patient on 01-AUG-2009. The patient's eyes were dilated and she only communicated with a few words instead of complete sentences or by shaking her head. The nurse said that the patient was in a type of shock and was experiencing a chemical imbalance. At the time of reporting, the patient did not recover and was still hospitalized. Additional information has been requested. 8/24/09 Hospital records received DOS 7/23/09 to 8/10/09. Assessment: Major depressive disorder, anxiety disorder, pregnancy. Patient presents with psychomotor slowing. Stares for extended periods of time without answering. Thought blocking. Not responding to internal stimuli. Eating poorly, nausea and vomiting. Affect blunted. Dehydrated. Auditory hallucinations and suicidal ideation. Haldol - acathesia. Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Confusional state, Convulsion, Dyskinesia, Loss of consciousness, Muscle twitching, Pain in extremity, Partial seizures, Sensory loss, Tremor, Vision blurred

Symptom Text: Information has been received from a consumer concerning her 18 year old daughter with no drug reactions/allergies who was vaccinated with the first dose of GARDASIL in "June 2008". The patient was vaccinated with meningococcal vaccine (manufacturer unknown) on the same day (Lot U2566AA). "Sometime in October 2008", the patient started having seizures. The patient was jerking sometimes and showing seizure episodes. The patient had some seizure attacks in "April 2009" and "June 2009". The patient was brought to the emergency room in "June 2009" and was not admitted in the hospital. The lab diagnostics studies performed: MRI, EEG, CAT SCAN. At the time of report the patient's status was not recovered. Follow-up information was received from a registered nurse indicated the patient received GARDASIL (Lot #660387/1967U) on 16-JUN-2008. Concomitant therapy included meningococcal vaccine (manufacturer unknown) (Lot #U2566AA). Follow-up information was received from a nurse assistant indicated that the patient had an EEG which was reported as "abnormal EEG" on 05-MAY-2009. On 12-MAY-2009 the patient had a MRI which revealed "Right frontal matter hyperintensity". On 14-MAY-2009 the patient was seen by a doctor and was placed on therapy with KEPPRA 750mg BID. The patient was instructed to not drive. The patient was to repeat the EEG and MRI in 6 months. The patient was to move to another state (date unknown) and instructed to find a treating neurologist when she moved. On 18-JUN-2009 the patient went to the emergency room due to "convulsions". The patient was not admitted to the hospital. Convulsion was considered to be an other medical event. Additional information has been requested. 8/12/09 PCP records received. In for PE with normal exam. Vaccines administered. 8/24//09 Neurological consult records received DOS 5/14/09. Assessment: Focal Seizures with possible secondary generalization. Patient presents for assessment of abnormal EEG. First episode of syncope 2/09 or 3/09. Twitching of body. Blurry vision. 2 w

Other Meds:

Lab Data: electroencephalography, 05/05/09, abnormal; magnetic resonance, 05/12/09, right frontal matter hyperintensity. 8/24//09 Neurological consult records received DOS 5/14/09. LABS and Diagnostics MRI Brain - abnormal, right frontal white matt

History: None. 8/12/09 PCP records received DOS 6/16/08. Torn Achilles. DOS 6/16/08. Assessment: Routine Physical Exam. Contraception. Skin freckling. 8/24//09 Neurological consult records received DOS 5/14/09. Left foot benign tumor removal.

Seriousness: HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Arthralgia, Musculoskeletal pain, Pain in extremity, Sensory disturbance

Symptom Text: Case received from the Health Authorities on 31-JUL-2009 under the reference numbers MA20091226 and 09-2228. Information has been received from an agency concerning a 14-year-old female patient who had been followed within a child in psychiatry environment from the age of 18 months to 12 years old received the first dose of GARDASIL (batch number not reported) via intramuscular route at the level of the left upper limb on 09-NOV-2008. One month later, she developed pain starting in the left upper limb, at the level of the scapular belt, then reaching the left leg, followed by right arm and then the right leg. After a consultation she was hospitalized from 27-JAN-2009 to 30-JAN-2009 at the Child Neurology Unit. The following work-up were performed and were normal: standard x-ray examination, left shoulder echotomography, shoulder MRI, cerebral MRI, 4 limbs electromyography, electroencephalography. Troponin, C-Reactive Protein, creatine kinase, lactic dehydrogenase, anti-Sm and anti-RNP antibodies, anti-SSA/Ro and anti-SSB/La antibodies, immunoglobulins M and immunoglobulins G were normal. Only the immunoglobulins A were a little high at 2.78. These pains, accompanied with sensitivity disorders, evoked a Parsonage-Turner syndrome but it was ruled out due to the resistance to corticotherapy. Final diagnosis was "rebel pain with a functional component". The teenager was treated with LAROXYL, EFFERALGAN CODEINE and MYOLASTAN following to a consultation to a pain center. At the time of report, the patient had not yet recovered. Sensory disturbance and pain in the joint involving the shoulder region, lower leg and limb were considered to be disabling. Other business partner numbers included E2009-07668.

Other Meds: Unknown

Lab Data: electromyography, ??Jan09, 4 limbs electromyography normal; electroencephalography, ??Jan09, normal; ultrasound, ??Jan09, left shoulder echotomography normal; X-ray, ??Jan09, normal; magnetic resonance imaging, ??Jan09, shoulder MRI normal;

History: Psychiatric symptom

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Blood product transfusion, Idiopathic thrombocytopenic purpura, Petechiae

Symptom Text: Case received from the Health Authorities in country on 30-JUL-2009 under the reference number L200907-506 and received through authority. A 12-year-old female patient had received the first dose of GARDASIL (lot # 0772X, batch # NK13910) via the intramuscular route on 26-JUN-2009 and 07-JUL-2009, she developed idiopathic thrombocytopenic purpura with petechiae and decreased platelet count. Her platelets level was found to be at 6,000 on 07-JUL-2009 and at 300,000 on 16-JUL-2009. She received corrective treatment with normal human immunoglobulins 800mg/kg via intravenous route. The patient recovered 9 days after onset of purpura. It was worth noting that the Health Authorities reported that vaccination had been administered 15 days before onset of idiopathic thrombocytopenic purpura, which was not consistent with time to onset between of date of vaccination and date of onset. The patient had no known clinical history, no previous history suggestive of viral infection and no previous history of adverse reaction to other drugs. The event was reported to be other important medical event. Other business partner numbers include E2009-07720. No further information is available.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Confusional state, Contusion, Ear haemorrhage, Fall, Fatigue, Immediate post-injection reaction, Injury, Loss of consciousness, Syncope, Tearfulness

Symptom Text: Immediately following HPV#2 and Varivax #2 (10:45 am) patient fainted and fell forward off of the exam table and hit her Left cheek, ear and knee on the ground. Her ear bled at the site of her earring. After being on the ground flat she regained consciousness within 45-60 seconds. She was confused for a few moments and tearful. Ice was applied to her cheek and she stayed and was observed for 15 minutes. She was told not to drive or go to work today and to call if she had vomiting, headaches or other changes. Mom is very upset. I called at 5:30 pm and patient is napping and other than having a bruise on her cheek (not swollen) and tired has no other worrisome signs. Mom wants a CT of brain and cheek done (she works in radiology at hospital). I do not think these are warrented at this time. She is angry I won't order them now and is going to file a report with the hospital.(she says.)

Other Meds: antibiotics s/p wisdom tooth extraction 5 days prior. I don't know what they are as they didn't know.

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abdominal pain, Condition aggravated, Diarrhoea, Fatigue, Headache, Heart rate increased, Nausea, Oropharyngeal pain, Pain, Pyrexia, Tonsillectomy, Vaccine positive rechallenge

Symptom Text: Information has been received from a health professional concerning her 18 year old daughter with no known allergies and a history of infectious mononucleosis ("a few years ago") who on unspecified dates was vaccinated with the first and second dose of GARDASIL (lot number not reported). Around 24-JUL-2009 (also reported as 26-JUN-2009) the patient was vaccinated with the third dose of GARDASIL (lot number not reported). The patient experienced a little fatigue and pain after the first and second dose of GARDASIL. Same day therapy included a "HTP" vaccine (unspecified) ("a tetanus or other usual vaccine that is given before someone enters college"). Concomitant therapy included LEXAPRO. On approximately 28-JUN-2009, 2 to 3 days after the administration of the third dose, the patient experienced low grade fever, diarrhea (still occurred periodically), rapid resting pulse up to 150 (still occurred periodically), headache (occurred every day), chronic severe abdominal pain and severe fatigue. The patient got her tonsils out 2 weeks prior to receiving the third dose of GARDASIL and experienced fatigue after the tonsils were removed. The fatigue became worse after the administration of the third GARDASIL. Test for mononucleosis, complete blood cell count, Lyme disease, abdominal ultrasound and sedimentation rate were performed and every test had been coming back negative. As of 05-AUG-2009 the patient had not recovered. Additional information has been received from a physician and a head nurse concerning the 18 year old female patient. On 08-JUN-2009 the patient was seen by the physician for a physical prior to college admittance. On 30-JUL-2008 she was vaccinated with the first dose of GARDASIL (lot number reported as 0070K, invalid for GARDASIL, but is a valid lot number for VARIVAX (Merck)). On 05-NOV-2008 the patient was vaccinated with the second dose of GARDASIL (lot number 661530/0575X). On 25-JUN-2009 (reported by the patient's mother as around 24-JUN-2009 and 26-JUN-2009) the patient was vaccinated with the

MedDRA PT Acute disseminated encephalomyelitis, Arthralgia, Asthenia, Drug eruption, Electrolyte imbalance, Grand mal convulsion, Hypersensitivity, Hypertension, Malaise, Nuclear magnetic resonance imaging abnormal, Pain, Pancytopenia, Pyrexia, Rash, Renal failure, Steroid therapy, Syncope, Urticaria

Symptom Text: Information has been received from a physician concerning a 18 year old female with hypothyroidism, obesity and no allergies who on 16-JUL-2009 was vaccinated with her first dose of GARDASIL (lot # 661846/1312X). Concomitant therapy included SYNTHROID. On 25-JUL-2007 the patient developed urticaria of hands and lower extremities, malaise, and body aches. The urticaria then became confluent, widespread, and the patient developed fever of 103-104F and joint pain. The patient was admitted to the hospital on 11-AUG-2009 and was being evaluated for systemic hypersensitivity syndrome. Testing had revealed splenomegaly, hepatomegaly, elevated aspartate aminotransferase (AST), alanine aminotransferase (ALT) and gamma-glutamyl transferase (GGT), elevated erythrocyte sedimentation rate (ESR) 86, elevated C-reactive protein, and low C4 and C3. The patient was being treated with hydration and unspecified antihistamines. Additional information has been received from the physician who saw this 18 year old patient on 06-AUG-2009, ran viral cultures which were negative, hepatitis A and C negative, Hepatitis B-fully immunized. A sonogram showed hepatomegaly and splenomegaly which were also present on exam. The patient was given Clindamycin in case this was a toxin mediated reaction. The patient was also seen by dermatologist in Doctor's office. Dermatologist thought rash and symptoms could of resembled drug or vaccine induced reaction but not the Stevens-Johnson syndrome (SJS) since no mucous membranes involved. On 12-AUG-2009, the physician reported that no other vaccines were given at the time that GARDASIL vaccine was administered (by the pediatrician's office) on 16-JUL-2009. On 06-AUG-2009, "at her worst", the patient's values were as follows: AST 76, ALT 200, GGT 375, ESR 86, and C-reactive protein 23.9 mg/dL. On 11-AUG-2009, the patient's C4 was less than 2.9 and C3 was 59. The patient remained in the hospital on 12-AUG-2009. Treatment included IV BENADRYL and ZANTAC. No steroids had yet been administered. The patient soug

MedDRA PT Acute disseminated encephalomyelitis, Convulsion

Symptom Text: Information has been received from a physician concerning a young female patient (age unknown) who on an unknown date several weeks ago was vaccinated with a dose of GARDASIL (lot, route and site not reported). The patient's medical history, relevant concomitant medications, relevant past drug history were unknown. On an unknown date, after receiving GARDASIL, the patient developed seizures. The physician stated that the seizures were definitely seizures and not another related condition. On an unknown date, after GARDASIL vaccination, an magnetic resonance imaging (MRI) showed an acute disseminated encephalomyelitis with possible complications. The physician was planning on testing the seizures and acute disseminated encephalomyelitis as if these diseases states were happening. The physician stated that he could not necessarily implicate GARDASIL as the cause of those conditions. As of 22-AUG-2009, it was unknown if the patient continued to take GARDASIL, and the results of the seizures and acute disseminated encephalomyelitis were unknown. Upon internal review seizures and acute disseminated encephalomyelitis were considered to be other important medical event. Additional information has been requested.

MedDRA PT Blood product transfusion, Lymphopenia, Thrombocytopenia, Vaccine positive rechallenge

Symptom Text: Information has been received from the Health Authorities on 31-JUL-2009: A 15 year old female patient with a history of HIV positive since her birth (mother to child contamination) was vaccinated with her 1st dose of GARDASIL (batch # not reported) in April 2009 (to be confirmed as date was also to be April 2008) and a dose of PNEUMOVAX (batch # not reported) on an unspecified date. After vaccination, her viral load was very slightly positive at 68 copies, but she experienced a marked decrease of CD4 T cells on a background of lymphopenia at 797/ml. She received the 2nd dose of GARDASIL (batch # not reported) in May 2009, after CD4 lymphocytes had increased. One month later, she developed thrombocytopenia and decreased CD4 T cells. She was hospitalized during one night to received intravenous injection of immunoglobulins. The patient was found to have platelet count at 6 on 24-JUN-2009, at 9 on 25-JUN-2009 and at 97 on 03-JUL-2009 (normal: 140-450g/l). In April 2006 (?) her CD4 T cells were at 0.19%. On 24-JUN-2009 her CD4 cells were at 0.478% and her viral load at 2964 copies/ml. At the time of reporting, the patient had not recovered. Other business partner numbers included E2009-07659.

MedDRA PT Adverse drug reaction, Balance disorder, Convulsion, Drug level below therapeutic, Epilepsy, Fall, Fatigue, Gait disturbance, Gaze palsy, Grand mal convulsion, Headache, Migraine, Muscle rigidity, Muscle twitching, Postictal state, Reading disorder, Vomiting

Symptom Text: Information has been received from a physician concerning a 14 year old female with no pertinent medical history and no known drug allergies (NKDA) who on 04-NOV-2008 was vaccinated with the first dose of GARDASIL (lot# 660518/0572X, dose and route not reported) and a dose of VARIVAX (Merck) (661668/1194X, dose and route not reported). Concomitant vaccination on 04-NOV-2008 included hepatitis A virus vaccine (unspecified) (lot# AHAVB264AA) and FLUMIST (LOT# 500570P). The patient was vaccinated with the second dose of GARDASIL (lot# 660616/0570X, dose and route not reported) on 10-JAN-2009 and the third 0.5ml dose of GARDASIL (lot# 661846/1312X, injection) on 14-MAY-2009. The patient's first seizure was on 04-MAY-2009 (prior to the third dose of GARDASIL). A computed axial tomography (CT) scan done that day was negative. The patient was not admitted. The patient's next seizure (gran mal) was on 19-MAY-2009. An electroencephalography (EEG) done on that day was abnormal, showing spikes in the left anterior region supportive of seizure disorder. The patient was not admitted again. The patient went on to have additional seizures in the latter part of July 2009, for which she was admitted to hospital and was diagnosed as epileptic syndrome. On unspecified day, a magnetic resonance imaging (MRI) was performed but the results came back clear. Length of hospital stay was unknown. At the time of reporting, the patient was recovering. The patient was being treated with DILANTIN and TOPAMAX and being followed by neurology. It was reported that the condition was not considered life threatening. The physician could only say that the patient found it was hard to read regarding disability. Upon internal review, seizure and gran mal seizure were determined to be other important medical events. Additional information has been requested. 8/14/09 PCP and ER records received DOS 3/28/05 to 7/30/09. Assessment: Localization related epilepsy of left frontal origin. Breakthough Seizures. Subtherapeutic antiseizure levels. 5/04/09 -

MedDRA PT Back pain, Cauda equina syndrome, Hypoaesthesia, Muscular weakness, Nerve root compression, Nerve root lesion, No reaction on previous exposure to drug, Paresis, Urinary hesitation

Symptom Text: This case was reported by a regulatory authority (# DE-PEI-PEI2009016805) and described the occurrence of paresis in a 17-year-old female subject who was vaccinated with ENGERIX B adult, (GlaxoSmithKline). Co-suspect vaccination included GARDASIL. Previous vaccinations with ENGERIX B and GARDASIL were well tolerated. There was no concurrent medical condition. Concurrent medications included birth control. On 25 June 2009 the subject received unspecified dose of ENGERIX B adult (intramuscularly, unknown application site), together with unspecified dose of GARDASIL (intramuscularly, unknown application site). On 2 July 2009, 7 days after vaccination with ENGERIX B adult and GARDASIL, the subject experienced lumbago. On 6 July 2009 the subject experienced aggravated back pain. On 8 July 2009 the subject experienced hypoesthesia and paresis of the right foot. On 12 July 2009 the subject experienced hesitancy with urination. This case was assessed as medically serious by GSK. The subject was treated with ibuprofen from 2 to 6 July 2009. At the time of reporting, on 17 July 2009, hesitancy with urination was improved, hypoesthesia and paresis were unresolved. The outcome of lumbago and back pain was unknown. The reporting physician considered that the events were related to vaccination with ENGERIX B adult, but first of all to vaccination with GARDASIL. The subject visited a neurologist. According to the neurologist's report, the subject experienced discrete weakness of lifting the right foot and toes. Spreading of the toes was slightly aggravated. The subject experienced hypoesthesia of the right forefoot. Electromyography: at renewed repeated sounding in the right Musculus tibialis anterior and right Musculus triceps surae when resting no active denervation at maximal innervation, electroneurographically also at muscular activity. Electromyography derivation from the antagonist: innervation partly noticeable. Nerve conduction speed: right and left Nervus peroneus dist. mot. about 4.0 msec, mot

MedDRA PT Condition aggravated, Convulsion

Symptom Text: Information has been received from a nurse and the patient's mother concerning a 24 year old female with migraine & depression, no known drug allergies (NKDA) and a history of seizure due to an overdose of WELLBUTRIN which was only one incident couple years ago. Concomitant therapy included LOESTRIN 1/20 and WELLBUTRIN. On 29-JUN-2009 the patient was vaccinated with the first dose of GARDASIL (LOT #658556/1060U). On 30-JUL-2009 she had a seizure. The outcome of the patient was recovered. She sought medical attention and was taken to ER but was not admitted. Upon internal review, seizure was determined to be an other important medical event. No further information is available.

MedDRA PT Fall, Jaw fracture, No reaction on previous exposure to drug, Syncope

Symptom Text: Information has been received from a gynaecologist concerning a 16 year old female patient who on 27-JUL-2009 was vaccinated IM with the second dose of GARDASIL (lot #: 1882U, batch #: NJ08310) into the upper arm on 27-JUL-2009. 10 to 15 minutes post vaccination, the patient experienced syncope for about 1-2 minutes. She fell down and sustained a mandibular fracture. She was admitted to hospital for monitoring and to exclude concussion. Fracture was treated nonsurgical. She was discharged on 28-JUL-2009. It was reported the first vaccination with GARDASIL given on an unspecified date was well tolerated. Additional information has been requested. Other business partner numbers include E2009-07773.

Symptom Text: Information has been received from a consumer concerning her 14 year old daughter who was in the remission of rheumatoid arthritis, with allergies to KEFLEX, MORPHINE and Phenergan (manufacturer unknown) and a history of having 2 periods per month. The patient on 09-JUN-2009 was vaccinated with GARDASIL. There was no concomitant medication. Within 30 minutes of the vaccination, the patient experienced fever, chills and vomiting. She was taken to office the next day and she was diagnosed with a bladder infection. She was prescribed antibiotics (unspecified); however, the antibiotics were not taken as the mother was concerned with the side effects affecting the muscles as the daughter was in remission for rheumatoid arthritis. Also, the day prior, the daughter did not show positive for a bladder infection. So the mother did not feel that the daughter had a bladder infection. After 4 days of daily vomiting, her daughter began to feel better. The fever, chills, muscle aches and cramps subsided; however, the vomiting continued to occur occasionally. On 17-JUL-2009, her daughter was taken to the emergency room due to the vomiting. She was discovered to have pelvic inflammatory disease. Tests for gonorrhea and chlamydia were negative. She was given PEPCID and NEXIUM for nausea and treatment of an ulcer which resulted from her vomiting. She was not admitted at this time. By the second week of July, the patient was throwing up a lot. On 21-JUL-2009, the mother took her daughter to the hospital. The patient was having headaches and throwing up at least once everyday. The patient was admitted and treated for dehydration from vomiting. (She also could not take the prescribed antibiotics for PID due to the vomiting). In the hospital, the patient was given intravenous antibiotics for 4 days for the abdominal pain. Various labs and diagnostic testing were done. Upper GI, CAT scan of the liver, kidneys and appendix were all normal. The patient was discharged with antibiotics (unspecified) for 10 days. She was scheduled for a sco

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain upper, Chills, Headache, Malaise, Mood swings, Muscle spasms, Myalgia, Nausea, Pelvic inflammatory disease, Pyrexia, Vomiting

Symptom Text: My daughter received the first GARDASIL Vaccine on June 9, 2009. Within 30 minutes she became ill with nausea, vomiting, fever, chills, headaches and severe muscle aches. I phoned the doctor they stated that she may have picked up a bug at the office the day before. Long story short, she recovered from the fever, chills and muscle cramps after 4 days but has continued vomiting, having stomach cramps and headaches and was hospitalized from July 21st through the 24th in the hospital. She had been to the emergency room on July 17th and 18th where we reside, and she was diagnosed with Pelvic Inflammatory Disease, PID. They treated her vomiting as an ulcer - guess work by prescribing PEPSID, which did not work, and said that the PID had to come from a sexually transmitted disease, but those test returned negative. At the hospital she was treated for the infection by I.V. antibiotics, since she was unable to hold anything down. She was tested for multiple things that would possibly explain the vomiting, but nothing showed up. I later found out on your site that PID, vomiting and headaches were all rare side effects of the GARDASIL Vaccine. My question is, because not one doctor was even aware of the possible side effects, so they do not have a clue as to when these side effects will subside or go away. She is no longer vomiting after every meal, yet she still vomits at least once a day and suffers from headaches and stomach aches. I am a single mom and the work that I had to miss has created a huge burden for me. But more than anything, my daughter and I would love to have an answer of where the light at the end of the tunnel may be! Follow-up:I would like to update my daughter's condition. Her report number is 354022. It has now been seven months since her one and only shot of GARDASIL and she continues to vomit every day. Also, I was looking at her VAERS report and it states that she has a preexisting condition of pregnancy. Please remove that from her report, as she has never been pregnant. Very irregular periods.

Other Meds:

Lab Data: 7/19/09: Pelvic Ultra Sound, Pelvic Exam, X-ray of gallbladder and kidneys, lab work...ie BMP, CBC, PREGNANCY HCG, SED RATE, and UA Void. Also checked for Gonorrhea and Chlamydia/GC DNA, both negative, From 7/21 through 7/23/2009 Upper G.I.

MedDRA PT Colitis ulcerative

Symptom Text: Information has been received from a Health Authority (ref no: 20467369), via an agency as part of a business agreement, concerning a 17 year old female patient who on 12-APR-2008 was vaccinated intramuscularly with the third dose of GARDASIL (site and batch number not reported). Concomitant therapy included OVRANETTE. Details of the patient's medical history have not been reported. The patient weighted 50 kg. The patient received three doses of GARDASIL (batch number not reported) between 13-OCT-2007 and 12-APR-2008. On 01-FEB-2009, eight months after the last dose, a colonoscopy was performed and the patient was diagnosed of severe distal ulcerative colitis. This was not responsive to treatment with steroid or balsalazide. The patient is now receiving treatment with azathioprine. The patient was not recovered. Both the reporter and the Health Authority considered this to be a serious due to disability and incapacity. No more information is available, this case is closed. Other business partner numbers include: E2009-07840.

Symptom Text: This case was initially reported to foreign agency by a health care professional on 31-JUL-2009. This case concerns a female patient (age not reported). Details of the patient's medical history and concomitant medication have not been reported. The patient received the first dose of GARDASIL on January-09 without any problems. The patient's sister received the GARDASIL at the same time without any problem. On an unspecified date, but when the dose was due, the patient received the second dose of GARDASIL (batch#, lot#, route and site not reported). On an unspecified date but following the second dose, the patient became very ill for a number of months with hair loss, which was coming out in lumps, weight loss, numbness and tingling in her arm, dizziness, loss of appetite, feeling full and bloated, cold and constipated and hot and cold flushes. The patient underwent a magnetic resonance scan (MRI) and unspecified blood tests (results not reported). The patient outcome is unknown. The patient and her sister refused vaccination with the third dose of GARDASIL. Upon internal review this case has been upgraded to serious due to the events of dizziness, numbness and tingling. Other business partner number included: E200907764. No further information is available. This information was previously reported in WAES# 0908USA00660. This report was created in order to capture the correct country source name (previously captured as a different country in WAES#0908USA00660). It was determined that WAES#0908USA00660 was previously sent to the FDA with an incorrect country source. Therefore, WAES#0908USA00660 was deleted from our files and the new report created for this case is WAES#0908USA01532. "WAES0908USA00660 was previously submitted to the FDA on 07-AUG-2009." This is a follow-up report(s) previously submitted on 12Aug09; 25Aug09; 26Aug09. This case was initially reported to SPMSD UK by a health care professional on 31-JUL-2009. This case concerns a female patient (age not reported). Details of the patient's medical histor

MedDRA PT Dizziness, Dyspnoea, Hyperhidrosis, Loss of consciousness, Nausea, No reaction on previous exposure to drug, Pallor

Symptom Text: This report was identified from a line listing obtained on request by the Company the FDA under the Freedom of Information Act. On 04-Aug-2009 a 16 year old female was vaccinated in the left arm with a first dose of GARDASIL (Lot #662518/0087Y). On the same day she was also vaccinated in the left arm with a first dose of HAVRIX (Lot #AHAVB249AD). Patient became dizzy 30 seconds after the shot. Patient was pale, diaphoretic and nauseous. Symptoms lasted about 45 minutes. Her blood pressure dropped to 90/50 and pulse to 50/minutes. On 20-Aug-2009 the primary care physician not was received (date of service 04-Aug-2009). It was reported that after the shots, patient became nauseated, pale, diaphoretic, dizzy and had difficulty breathing. Blood pressure dropped to 90/50 and pulse into the 50's. The symptoms lasted about 45 minutes with return to baseline. Vaccine records stated patient "passed out." According to the PCP not received on 20-Aug-2009 (date of service 04-Aug-2009), the patient never experienced these symptoms with previous shots. The listing indicated that one or more of the events was considered to be immediately life-threatening. No further information is available. The original reporting source was not provided. The VAERS ID # is 354037-1. A standard lot check investigation has been finalized. All in-process quality checks for the lot number in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the Center for Biologics Evaluation and Research and was released.

MedDRA PT Blindness transient, Dysstasia, Hyperhidrosis, Immediate post-injection reaction, Loss of consciousness, Mydriasis, Pallor, Unresponsive to stimuli

Symptom Text: Approximately 20 seconds after the GARDASIL with no warning she passed out and became unresponsive for 10 seconds. She was very pale, diaphoretic and had a heart rate of about 64. When she came too she was unable to stand and had fully dilated pupils and so could not see. I managed to get her to a room with a table and lay her down. She gradually became fully responsive but had dilated pupils for about 7 minutes from the start of the reaction. Being concerned about anaphylaxis I called 911 while she was not fully responsive, they came and checked vitals, BP 104/68, glucose 94. At no time was her breathing compromised. This whole episode lasted about 25 minutes, after which she fully recovered.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Anxiety, Attention deficit/hyperactivity disorder, Convulsion

Symptom Text: Patient reported to us o10/22/09: She had a seizure 2 months after 2nd GARDASIL Injection Neurology Consultations received for dates of service 9/8/08 to 3/9/09. Dx: Seizures disorder. Assessment: Developed 2 loss of consciousness episodes with tongue biting in 11/07 and 12/07. She started on Topamax, but found that it caused side effects, so was switched to Depakote, on which she also had side effects. She is now on Keppra and has remained seizure free since the initiation of antiepileptic drugs. Noted memory problems on Keppra and was started on Adderall for ADD with good results. She developed anxiety for which she was prescribed alprazolam.

Other Meds: YASMIN; birth control pills.

Lab Data: 2 - MRI's, 2 - EEG's. 2 EKG's, 24 hour EEG ->; All were negative. Neurology Consultations received for dates of service 9/8/08 to 3/9/09. Labs and Diagnostics: MRI of the brain-normal, 24 hour EEG-normal.

History: None. Neurology Consultations received for dates of service 9/8/08 to 3/9/09. PMH: ADD, breast augmentation.\n 8/5/09.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Convulsion

Symptom Text: Information has been received from a nurse concerning a 20 year old female who on 13-AUG-2007 was vaccinated intramuscularly on her left deltoid with the second dose of GARDASIL (Lot # 658222/0927U). Concomitant therapy included YASMIN. On 01-NOV-2007 two months after her second vaccination the patient experienced a seizure. The patient sought medical attention and went to an unspecified emergency room. The patient was prescribed TOPAMAX, DEPAKOTE, KEPPRA in the beginning of November 2007. The patient underwent two magnetic resonance imaging (MRI), two electroencephalography (EEG), two electrocardiogram (EKG) and a 24 hour EEG which were all negative. Unknown if the third dose of GARDASIL was given at the office as 05-AUG-2009. The patient recovered from seizure. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested.

Other Meds: YASMIN

Lab Data: Electroencephalography, 11/??/07, negative; Magnetic resonance, 11/??/07, negative; Electrocardiogram, 11/??/07, negative; Electroencephalography, 11/??/07, negative

MedDRA PT Decreased activity, Hypotonia, Syncope

Symptom Text: This case was reported by a regulatory authority (# ES-AGEMED-031435340) and described the occurrence of syncope in a 12-year-old female subject who was vaccinated with TWINRIX pediatric (GlaxoSmithKline), GARDASIL (non-gsk). On 22 May 2009, the subject received 2nd dose of TWINRIX pediatric (subcutaneous, unknown injection site), 1st dose of GARDASIL (subcutaneous, unknown injection site). On 22 May 2009, less than one day after vaccination with GARDASIL and TWINRIX pediatric, the subject experienced syncope with hypotonia and hypoactive. The regulatory authority reported that the events were clinically significant (or requiring intervention). On 22 May 2009, the events were resolved. The regulatory authority reported that the events were probably related to vaccination with TWINRIX pediatric and GARDASIL. No further information could be obtained as the regulatory authority has provided all the available information. This case has therefore been closed.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Autoimmune disorder, Idiopathic thrombocytopenic purpura, Platelet count decreased

Symptom Text: Blood work was done as a routine physical one year after vaccine was distributed and the patients blood platelet count was at a low of 90 (normal range 140-400) Primary physician suggested that patient see a hemotologist, over the last year 2008-2009 patient has undergone routine bloodwork 01-09, 03-09, 05-09, and platelet count was still low, then Hemotologist had patient do a bone marrow biopsy to see if maybe her marrow wasnt producing enough platelets, biopsy showed that marrow was producing a healthy count of platelets, so after much blood work and evaluation, patient now has an auto-immune disease called ITP where her immune system is killing off her platelets leaving her with a low range of platelets, prior to the vaccination blood work shows normal range of platelet counts.

Other Meds:

Lab Data: Blood work done every 1-4 months, as well as a bone marrow biopsy

History: mitro-valve regurgitation

MedDRA PT Encephalitis, Headache, Musculoskeletal pain, Neck pain

Symptom Text: Case reported by Health Authority (case n. 102085) through authority (local case n. IT334/09). Initial report received on 06-AUG-2009. An 11-year-old female was vaccinated on 22-JUN-2009 with a dose of GARDASIL (batch n., route and site of administration not reported). On 24-JUN-2009, 3 days after vaccination, the patient experienced meningoencephalitis, probably of viral etiology without any pathogen isolated and with progressive evolution. Since 21-JUN-2009, the patient presented headache and cervical pain during treatment with TACHIPIPINA and ibuprofen for right shoulder post trauma pain since 5 days. All the treatment were withdrawn, sedation and mechanical ventilation. DEPAKINE IV, acyclovir IV, ROCEPHINE, ampicillin IV, dexamethasone, omeprazole IV. Final outcome is not reported. Case is closed. Health Authority (HA) considered paracetamol and ibuprofen as suspect drugs and coded the reactions meningoencephalitis and headache. Other business partner numbers include: E2009-07851. No further information is available.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abdominal pain, Abdominal pain upper, Alopecia, Amenorrhoea, Arthralgia, Asthenia, Back pain, Body temperature decreased, Constipation, Diarrhoea, Dizziness, Dyspepsia, Emotional distress, Eye pruritus, Fatigue, Food allergy, Fungus stool identified, Gastrointestinal pain, Gastrooesophageal reflux disease, Genital discharge, Headache, Hormone level abnormal, Hypoaesthesia, Hypotonia, Immediate post-injection reaction, Influenza like illness, Irritability, Menstrual disorder, Menstruation irregular, Myodesopsia, Neurological symptom, Oesophageal disorder, Pain in extremity, Palpitations, Paraesthesia, Parasite stool test positive, Pyrexia, Sleep disorder, Urticaria, Vaginal discharge, Vaginal odour, Vaginitis bacterial, Vulvovaginal discomfort, Weight decreased

Symptom Text: Within one week of receiving the first shot (10/24/2007), I experienced flu-like symptoms, fever, and such severe vaginal discomfort that I went to the emergency room. I was diagnosed with bacterial vaginosis. It cleared up, but my health felt off - worse digestion, I started getting heartburn, feeling fatigue, started seeing floaters in my vision and getting terrible headaches, and my menstrual cycle started becoming more irregular. I had always been like clockwork. I started losing weight, which was unusual, as I had always been overweight and had a hard time losing weight. I began feeling more and more irritable, but made no connections to the Gardasil shot. In March, immediately after receiving the second vaccine (3/17/08), my arm hurt terribly, I felt lightheaded, woozy, and had hives appear. Within 1 week, I started experiencing vaginal irritation again, fever, and had flu like symptoms. Over the course of the next month, I started to feel such severe fatigue, stomach aches, and uncontrollable diarrhea, that I went to my doctor. She told me I probably just had acid reflux. Two days later, I experience debilitating stomach pain, which lasted for nearly 1 month. I had an endoscopy, a CT scan, allergy tests, and blood work for thyroid disorders and other imbalances, all of which have come back reasonably normal and regular for my body and system. I did have some esophageal damage from acid reflux, and was put on Prevacid. Receiving no answers from the clinic, I cut out gluten, corn, soy, dairy, eggs, caffeine, alcohol, yeasts, and sugar from my diet and started working with an acupuncturist and naturopath. Stool sampling showed signs of Candida Yeast overgrowth in my intestines and parasites, which I am combating naturally with help from my naturopath, and managed to eliminate with diets and supplements after 9 months of treatment. I a got off the Prevacid successfully with her help, and am starting to feel stronger. All total, after the vaccines, I experienced extreme weight loss (50 pounds), hair loss, fa

MedDRA PT Nausea, Pallor, Shock

Symptom Text: Information has been received from a registered nurse concerning a 16 year old female who was vaccinated with the "first dose" of GARDASIL (injection, lot# not reported) in the "last week" (approximately 27-JUL-2009). Concomitant therapy included MENACTRA. The nurse stated that the patient received her first dose of GARDASIL and "2 minutes later the patient felt nauseated and she turned white, her lips were white". The nurse added that the patient looked like she maybe going into shock at that time. The nurse took blood pressure and checked her heart rate which were fine and they had the patient lie down for 5 to 10 minutes and then she started to feel better. The patient fully recovered after 20 to 30 minutes. The patient was given water and grapes. Upon internal review, shock was determined to be an other important medical events. Additional information has been requested.

MedDRA PT Abdominal pain upper, Abdominal tenderness, Crying, Diarrhoea, Headache, Heart rate increased, Hyperhidrosis, Hypertension, Impaired gastric emptying, Palpitations, Vaccine positive rechallenge, Vomiting

Symptom Text: Information has been received from a consumer concerning her 14 year old daughter with no pertinent medical history and no known drug allergies who in "August/September 2006", was vaccinated with the first 0.5ml dose of GARDASIL (injection, lot# not reported). There was no concomitant medication. The consumer reported that in "mid January 2007", her daughter experienced diarrhea, vomiting and she was unable to keep food in her stomach after getting second dose of GARDASIL in November/December 2006. The patient was hospitalized end of February 2007 and was diagnosed with gastroparesis by physician at the hospital. The patient was discharged on 07-MAR-2007. She received the third dose of GARDASIL in April/May 2007. Lot# was not provided. The patient was recovered but she would get periodic gastroparesis it depended on what she ate. On unspecified day, a stomach emptying scan test and numerous other tests were performed, and the results were unknown. Follow up information has been received via telephone call from a physician indicating that the patient received the first dose of GARDASIL on 20-OCT-2006 (Lot number unavailable to the physician). The patient received the second dose of GARDASIL on 20-DEC-2006 (Lot number unavailable to the physician) and the third dose of GARDASIL on 01-MAY-2007 (Lot number unavailable to the physician). The physician stated that the lot number records for the GARDASIL vaccinations were accidentally discarded. The physician stated that she had changed her Physician Practice and had not seen the patient in over one year. The physician confirmed that the patient was hospitalized sometime at the end of February 2007 and was discharged from the hospital on 07-MAR-2007. The physician confirmed that the patient was diagnosed with Gastroparesis. The health care professional contacted during telephone follow-up could not supply the following information: lot number (if applicable). Additional information has been requested. 9/1/09 MR received for DOS 2/28-/06/2007 with D/C DX: Gastropar

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Arrhythmia, Cardiac neurosis, Chest discomfort, Dizziness, Feeling hot, Heart rate increased, Hyperhidrosis, Immediate post-injection reaction, Panic attack, Presyncope, Tachycardia

Symptom Text: Information has been received from a general practitioner on 13-JUL-2009 concerning a 22-year-old female patient who was vaccinated with a second does of GARDASIL (LOT#, injection site and route not reported) in year 2008 (three-quarter year prior to reporting date). Immediately, post vaccination, the patient experienced presyncope. She had recovered at that time. The event reoccurred in the further course of a three-quarter year. Several investigations (unspecified) were carried out and showed no pathological findings. Outcome was not reported. Follow-up information received on 11-AUG-2009. This case was upgraded due to hospitalization of the patient. Several medical letters, the hospital report and the reporting from where sent by the reporter. It was reported that the 21-year-old female patient with medical history of thoracic syndrome with intercostal neuralgia as neurodermatitis and alleged valvular heart defect in childhood was vaccinated with a third dose of GARDASIL (LOT# 0251U, Batch# NF65480) IM into the upper arm on 10-APR-2008. Concomitant medication included a hormonal contraceptive for system use. 1.5 hours post vaccination she suddenly developed dizziness, sensation of heat, retrosternal pressure, a rapid pulse, presyncopial condition, panic attack, cardiac arrhythmia and tachycardia. She also complained about sweating attack and was hospitalized on the same day. After she laid down symptoms improved. Over the course of time the patient showed similar symptoms twice. ECG (long term and at rest) showed no pathological findings. Transthoracal echocardiography was carried out on 11-APR-2008 and showed no indication of relevant haemodynamic valvular heart defect. A haemodynamic relevant cardiac arrhythmia was also ruled out. On 11-APR-2008 the patient was discharged in a good general condition. Because of relapsing thoracal discomfort the patient presented at a cardiologist on 18-JUL-2008. A moderate prolapse of the anterior mitral valve cusp with minimal, not haemodynamic relevant mitral valve insuffi

Other Meds: Hormonal contraceptives (unspecified)

Lab Data: transthoracic echocardiography, 11Apr08, no indication of relevant haemodynamic valvular heart defect; transthoracic echocardiography, 11Apr08, hemodynamic relevant cardiac arrhythmia ruled out; echocardiography, 18Jul08, A moderate prolaps

History: Intercostal neuralgia; Neurodermatitis; Heart valve incompetence; Thoracic outlet syndrome

MedDRA PT Convulsion

Symptom Text: Information has been received on 06-AUG-2009 from the Health Authority (reference # ES-AGEMED-615706233) concerning a 14 year old female with no other relevant history reported who on 21-FEB-2009 was vaccinated intramuscularly with a 0.5 ml dose of GARDASIL (lot# , site of administration not reported). On 29-MAR-2009 the patient experienced a convulsion that lasted 5 minutes, the patient recovered. Case is closed. Case reported as serious by the HA with other medically important condition as criteria. Other business partner numbers included: E2009-07846. No further information is available.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Convulsion, Fall, Head injury, Posturing, Syncope, Tonic clonic movements

Symptom Text: Information has been received from a physician concerning a "17-18 years old" female who "about two weeks ago" (approximately 28-JUL-2009) was vaccinated intramuscularly with the first dose of GARDASIL (LOT# not reported). There was no concomitant medication. After vaccination, the patient was taken to the waiting room where she fell backwards and hit her head. She was helped up and fainted for a second time. The physician stated that she was showing "posturing seizure-like activity" and that she was "obviously seizing". The office called 911 and an ambulance came to bring the patient to the emergency room. The physician followed-up with the patient in the office the next day, and he believed that the patient had recovered. No further information was available at the time of this report. Follow-up information has been received via a telephone call from the physician. It was reported that the 18 years old patient with no pertinent medical history and no known drug allergies on 27-JUL-2009 was vaccinated intramuscularly with the first dose of GARDASIL (LOT# 661953/1130X). There was no concomitant medication. On 27-JUL-2009, five minutes after vaccination, the patient experienced seizure activity which included tonic-clonic movements. The patient was taken to the emergency room. A CT scan of the head was performed on that day, and the result was negative. The patient was not admitted. Two days later, the patient was seen in the office and she had fully recovered. She was not referred to neurology. Additional information is not expected.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Grand mal convulsion, Loss of consciousness

Symptom Text: Information has been received from a physician concerning a 17 year old female with childhood seizures from age 5-11 years old and had been seizure free since 11 years old and with no drug reactions/allergies. On 05-AUG-2009 the patient was vaccinated IM with the first 0.5ml dose of GARDASIL. The patient had been on DEPAKOTE (last dose was at age 13). On 05-AUG-2009 three hours after she received GARDASIL the patient had a grand mal seizure with loss of consciousness. The patient was seen in the emergency room at the hospital. There was no family history of seizure noted. The lab diagnostics studies performed: Genetic blood tests, "CBC", "CMP" urine analysis, "EKG" and all were negative. The patient was scheduled for a 48 hours Electroencephalography (EEG) next week. The physician requested to have WAES form faxed to him and he would provide all needed information. At the time of report the patient's status was recovering. Upon internal review, grand mal seizure was determined to be an other medical event. Attempts to obtain follow-up information have been unsuccessful. Additional information has been requested.

Other Meds: Unknown

Lab Data: electrocardiogram, negative; diagnostic laboratory, "CMP" urine analysis; hematology, genetic blood tests negative; complete blood cell, negative

MedDRA PT Grand mal convulsion, Immediate post-injection reaction

Symptom Text: Information has been received from a physician concerning a 16 year old female who in approximately July 2009 (about 1 month ago), was vaccinated with the first dose of GARDASIL (lot#, route and site of administration not reported). The patient experienced a tonic-clonic seizure almost immediately after vaccination. Her symptoms resolved quickly in about 10 to 15 minutes. Unspecified medical attention was sought. No lab diagnostics studies were performed. On an unspecified date, the patient recovered. Upon internal review, tonic-clonic seizure was determined to be an other important medical event. Additional information has been requested.

MedDRA PT No reaction on previous exposure to drug, Pruritus, Urticaria

Symptom Text: Information has been received from a health authority (reference number PEI2009016731). It was reported by a pediatrician that a 13-year-old female patient was vaccinated with the second dose of GARDASIL (lot no., injection site not reported) intramuscularly on 06-JUL-2009. On the same day the patient developed generalized urticaria with pruritus and hives. She was treated with SOLU-DECORTIN and FENISTIL IV and had recovered after "half a day". Dose one of GARDASIL given on an unknown date was well tolerated. Change in laboratory parameters in relation to the adverse event. Upon internal review events were considered medically significant. Other business partner numbers include: E2009-07887. No further information is available.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abdominal pain, Breath sounds abnormal, Dysphagia, Dyspnoea, Foaming at mouth, Scar, Throat tightness, Vaccination complication

Symptom Text: 7/29/09 - Client called Health Department at approximately 3:40 with complaints of severe abdominal pain and "white foam coming from her mouth, after receiving GARDASIL vaccine. Client spoke with Administrative Assistant, who advised to call 911 and client was then transferred to the "Nurse of the Day, " for further evaluation. Client had hang up requiring Nurse to return call to client. No answer - Message was left for client to seek medical attention by calling 911 or going to ER. Documented time of Service (vaccine administration) at the Health Department was 12:30. 7/31/09 - Follow-up: Telephone call to client, client not available, spoke to family member. Family member states all signs and symptoms have resolved and that the Hospital diagnosis was a reaction to GARDASIL. Asked family member to provide copy of discharge instructions and advised that VAERS Report would be completed by this PHN. Family member verbalizes understanding and states that she will provide the requested documentation. 7/31/09 - Receipt of documentation: Family member presents to clinic with documentation of client's ER visit. Documentation received by Administrative Assistant. 8/04/09 - Completion of VAERS Report. 9/2/09 ER records received DOS 7/29/09. Assessment: Vaccine side effect. Abdominal pain. Patient developed intermittent abdominal cramping and difficulty swallowing. Shortness of breath. Diminshed breath sounds bilaterally. Abdomen is tender. Scar on chest. On day one of menstrual cycle. Throat initially felt tight but not now. Symptoms spontaneously resolved.

Other Meds: None reported

Lab Data: 9/2/09 ER records received DOS 7/29/09. LABS and DIAGNOSTICS: Urine pregnancy test (-).

History: NKDA; Allergy to crabs and mites; no other conditions reported. 9/2/09 ER records received DOS 7/29/09. Shellfish, environmental allergies. VSD repair as infant. menstrual cramps.

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, LIFE THREATENING, PERMANENT DISABILITY, SERIOUS

MedDRA PT Adverse reaction, Back pain, Biopsy lymph gland, Chemotherapy, Computerised tomogram abnormal, Condition aggravated, Ear pain, Hodgkins disease nodular sclerosis stage II supradiaphragmatic, Hypertension, Idiopathic urticaria, Lymphadenitis, Lymphadenopathy, Mass, Neck pain, Obesity, Pain, Polydipsia, Radiotherapy, Rash, Skin burning sensation, Urticaria

Symptom Text: My daughter had been suffering from extreme full body Uticaria for three years and had been treated with benadryl, allergy medications, hydrocortisone creams and occasionally would be put on prednisone med pacs to control the uticaria. Two or Three weeks after her second vaccine of gardisil she noticed a lump on her neck. I took her to her pediatrician and was prescibed an antibiotic for possible glndular infection. After the course of the antibiotics were finished she came to me about 20 days later and said the lump never went away and now it was bigger. I immediately went back to my pediatricians office the next day. He sent her for an iimmediate cat scan. The cat scan results were enlarged lymph glands in her head neck and chest.We rushed her to the hospital rigth from his office where she was admitted. A biopsy was performed and she was diganosed with lymphoma cancer stage two.(Hodgkins) I am sure that this was caused by the gardisil vaccine. 8/25/09-record received for DOS 5/12/06-for allergy specialist visit for C/O difficulty controlling hives present since 9/05. Impression: idopathic urticaria. 8/24/09 PCP and oncology medical records received DOS 4/15/08 to 5/15/09. Assessment: Hodgkin Lymphoma Nodular Sclerosing Type, Stage IIAd. Patient presents with painful burning rash on extremities. Urticaria, obesity, polydipsia. Hypertension. Ear pain. Cervical lymphadenitis. Chemotherapy and radiation. Pain neck and back - resolving radiation reactions.

MedDRA PT Convulsion

Symptom Text: Information has been received from a nurse concerning a 20 year old female who on 13-AUG-2007 was vaccinated intramuscularly on her left deltoid with the second dose of GARDASIL (Lot # 658222/0927U). Concomitant therapy included YASMIN. On 01-NOV-2007 two months after her second vaccination the patient experienced a seizure. The patient sought medical attention and went to an unspecified emergency room. The patient was prescribed TOPAMAX, DEPAKOTE, KEPPRA in the beginning of November 2007. The patient underwent two magnetic resonance imaging (MRI), two electroencephalography (EEG), two electrocardiogram (EKG) and a 24 hour EEG which were all negative. Unknown if the third dose of GARDASIL was given at the office as 05-AUG-2009. The patient recovered from seizure. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested.

Other Meds: YASMIN

MedDRA PT Dysphagia, Dysstasia, Gastrointestinal infection, Muscular weakness, Psychosomatic disease, Speech disorder

Symptom Text: Information has been received from a pharmacist concerning a 16 year old female with no other relevant history reported who on an unspecified date was vaccinated with a dose of GARDASIL (lot#, route and site of administration not reported). Some months post vaccination the patient experienced a gastrointestinal infection. She recovered. Subsequently the patient complained about weakness of arms and legs so that she nearly could not stand. On an unspecified date the patient was hospitalized for diagnostics. All investigations including lumbar puncture/cerebrospinal fluid (CSF) showed no pathologies. Diagnosis of suspicion of psychosomatic disease was established. An according treatment was started. Additional information was provided on 12-AUG-2009. Meanwhile the patient additionally had "difficulties in speaking and swallowing". At the time of reporting the patient had not recovered. The reporter dose rather not assume a causal relation to therapy with GARDASIL. Other business partner numbers included: E2009-07945. Additional information has been requested.

MedDRA PT Anxiety, Chemotherapy, Headache, Hodgkins disease, Hodgkins disease nodular sclerosis stage unspecified, Lymphadenectomy, Lymphadenopathy, Migraine, Odynophagia, Oropharyngeal pain, Pallor, Photophobia, Rash, Sinusitis

Symptom Text: Pt received the Gardasil series of shots on July 20, 2007, Sept. 26,2007 and Feb. 20, 2008. In Jan. 2009, she told me (her mother) about a large lump on her neck. It had clearly been there for sometime based on it's size (4cm x 3cm) and consistency. The pediatrician thought this was a benign swollen lymph node, but subsequently, this was biopsied by a surgeon and Jennifer was diagnosed with Hodgkin's Lymphoma, nodular sclerosis type. While we understand that there is not live virus in the vaccine, we believe that there is an association between the generated immune reaction to the HPV recombinant protein and Hodgkin's Lymphoma. My daughter is now undergoing chemotherapy for her cancer. I sincerely hope the CDC will collect data on Gardasil and the onset of Hodgkin's lymphoma in young girls. 9/1/09 PCP medical records received DOS 7/15/08 to 1/19/09. Patient presents with anxiety, migraines, sinusitis. 9/1/09 PCP medical records received 2/17/09 to 7/17/09. Assessment: Lymphadenopathy. Patient presents with headache frontal, associated with nausea and vomiting. Three migraines last two weeks, throbbing, photophobia. Sore throat, unable to swallow. Cervical lymph nodes bilateral. Rash on abdomen. Swollen cervical lymph nodes 2 months left side. 9/21/09 Received ENT & Heme/Onc consults. FINAL DX: Hodgkins lymphoma, nodular sclerosing, stage IIA. Records reveal patient was pale & had firm left clavicular lymph node. Excisional biopsy done 7/23/09 revealed diagnosis. Tx w/chemotherapy & possibly radiation tx when chemo completed.

Other Meds:

Lab Data: CBC, CMP, CT, PET, supraclavicular lymph node biopsy. 9/1/09 PCP medical records received DOS 7/15/08 to 1/19/09. LABS and DIAGNOSTICS: Strep (-). 9/1/09 PCP medical records received 2/17/09 to 7/17/09. LABS and DIAGNOSTICS: Rapid Strep

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Caesarean section, Drug exposure during pregnancy, Labour complication, Premature labour

Symptom Text: Information has been received from a 28 year old female who on 19-SEP-2007 was vaccinated with her first dose of GARDASIL. There was no concomitant medication. She later discovered that she was pregnant at the time of the vaccination (gestation 4 weeks). LMP was reported to be 29-AUG-2007 and estimated delivery to be 29-MAY-2008. The patient has a history of two interrupted pregnancies with no reported complications or adverse events. At time of reporting patient had no AE. Follow up information has been received from consumer on 14-JUL-2009. The patient gave birth to twins on 04-MAY-2008 with acute cesarean section as one of the twins lay wrong when the water broke. The girl weighed 2525 g and was 46 cm tall and the boy weighted 2610 g and was 46 cm tall. They were admitted to neonatal department for observation as they were born 4 weeks early. No remarks on the test (unspecified) performed on the neonatal ward. The girl had two large birth marks (mark called "wild strawberry birth mark") on the side but the doctor told it was hurtless and common. It usually disappears before school age. There is nothing else to remark on so far. The pregnancy was told to be easy considered a twin pregnancy. The mother had decreased blood pressure and decreased iron value during pregnancy. The birth marks were still present at the time of reporting. A corrective version was created on 07-AUG-2009 to upgrade the case to serious and code adverse events. Labour complication, iron decreased and blood pressure decreased were considered to be other important medical events. Other business partner numbers included E2007-08874 and E2009-07903. Additional information is not expected. The case was closed.

Other Meds: Unknown

Lab Data: blood pressure measurement, Decreased during pregancy; laboratory test, Decreased iron level during pregancy

MedDRA PT Loss of consciousness, Syncope, Tonic clonic movements

Symptom Text: Initial information has been received on 12-AUG-2009 from the Health Authority (reference number ES-AGEMED-731434440) concerning a 12 year old female with no other relevant history who on 08-AUG-2009 was vaccinated with a dose of GARDASIL (lot#, route and site of administration not reported). On 08-AUG-2009 the patient experienced a syncope. In the Health Authority's report narrative field it was reported that the patient experienced a loss of consciousness with mild tonic clonic movements. In the report's adverse event box only adverse event code was syncope. On 08-AUG-2009 the patient recovered from syncope. Case reported as serious by the HA with other medically important condition as criteria. Case is closed. Other business partner numbers included: E2009-07981. No further information is available.

Seriousness: HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Cardiac failure, Haemodialysis, Oral contraception, Pelvic venous thrombosis, Pericardial effusion, Pericardiotomy, Postoperative renal failure, Pulmonary embolism, Resuscitation, Thrombectomy

Symptom Text: Case received from health authority on 10-AUG-2009 under reference number PEI2009016714. Information has been received from an agency concerning a 22 year old female with a history of MIHFR gene mutation (MIHFR) who in July 2008, was vaccinated with the first dose of GARGASIL (lot#, route and site of administration not reported). In August 2008, she was vaccinated with the second dose of GARDASIL (lot#, route and site of administration not reported). On an unspecified date in September 2008 she was vaccinated with the third dose of GARDASIL (lot#, route and site of administration not reported). Concomitant therapy included hormonal contraceptive with VALETTE which was assumed by the reporter to be suspect drug, too. Toleration of the first two doses of GARDASIL were not reported. On 30-OCT-2008, about 2 weeks post vaccination, the patient experienced a fulminant pulmonary embolism due to subacute solitary left pelvic venous thrombosis. The patient had to be resuscitated several times. She was hospitalized. Pulmonary thrombectomy was carried out on 30-OCT-2008. Subsequently the patient developed right heart insufficiency and pericardial effusion. Pericardiotomy was carried out on 09-NOV-2008. Postoperative (exact onset not reported) the patient developed renal failure. Haemodialysis was carried out until 26-NOV-2008. Treatment with anticoagulants (not specified) was ongoing at the time of report to HA. The patient recovered completely and was discharged from hospital on 08-DEC-2008. Pulmonary embolism, pelvic venous thrombosis, resuscitation, thrombectomy, heart insufficiency, pericardial effusion, pericardiotomy, postoperative renal failure and haemodialysis were considered to be immediately life-threatening. Other business partner numbers included: E2009-07888. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Convulsion, Dizziness, Gaze palsy, Headache, Musculoskeletal stiffness, Nausea, Pallor, Syncope

Symptom Text: Took my three daughters to their doctors for the GARDASIL shot. One daughter was fine, no reaction. The youngest daughter -11 years old- felt nauseous and went pale and had a mild headache. My oldest daughter -15 years old- is the one who had the severe reaction. I believe she had a seizure and not just fainted. She first complained of feeling nauseous then dizziness. Her eyeballs rolled in the back of her head and her whole body went stiff. I could barely lift her stiff legs on the table and lay her head down. After about a minute of calling her name, she finally woke up but was very pale and had a bad headache. The doctor just blew me off, but I will not let my daughters receive this shot again.

Other Meds:

Lab Data: None

History: My oldest daughter has seasonal allergies, ovarian cysts, but no other known medical conditions. My youngest daughter had a fever seizure as an infant we think because of the pertussis in the APT shot. She also had ADHD. My middle daughter -the one who had no reaction to the shot- also had ADD but no other medical conditions.

MedDRA PT Dizziness, Hyperhidrosis, Inappropriate schedule of drug administration, Injection site pain, Muscle rigidity, Neck pain, No reaction on previous exposure to drug, Pain in extremity, Pallor, Presyncope, Syncope, Vomiting

Symptom Text: Patient had first Gardisil injection at her pediatric clinic without complications approximately 1 year ago. Gave 2nd Gardisil 0.5ml injection in L Deltoid on 8/7/09. Patient stated that it hurt then started to lean to the left side. Her body went rigid, hands clenched at chin level. She quickly sat up and opened eyes and became responsive. She was pale, diaphoretic, radial pulse of 58 bp 90/60. Placed her head between knees and did slow deep breathing. Patient stated she felt better. VS more stable...pulse 64, bp 96/62. Aproximately 10 minutes later, patient became pale, diaphoretic, dizzy c/o neck pain. Radial pulse 58, thready, bp 92/58. Staff called 911. Kept patients head down, slow breathing until EMT's arrived. Gave EMT's report of sx and vitals. Patient vomited x 2. Patient recovered. EMT's stated that she vasovagaled from the injection. She had not eaten dinner the night before or breakfast or had anything to drink since the night before which may have contributed to the fainting as well. Patient did not want to go to ER...father signed release, patient left with dad and boyfriend.

Other Meds:

Lab Data:

History: No Allergies, Migraine headaches, Smoker.

Prex Illness: Possible dehydration- patient told EMT's that she had not had anything to eat or drink since the day before her injection.

Seriousness: ER VISIT, HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abdominal pain, Abdominal pain upper, Activities of daily living impaired, Aphasia, Blood lactic acid increased, Conversion disorder, Convulsion, Diplopia, Dysphemia, Dysstasia, Eructation, Fatigue, Fluid retention, Gait disturbance, Grip strength decreased, Hemiparesis, Hypoglycaemia, Malaise, Ovarian cyst, Panic attack, Paraesthesia, Pelvic pain, Pyrexia, Retching, Sensation of heaviness, Sensory disturbance, Sinus tachycardia, Speech disorder, Staring, Subcutaneous abscess, Supraventricular tachycardia, Syncope, Tachycardia, Thyroid neoplasm, Tremor, Vision blurred, Walking aid user, Wheelchair user

Symptom Text: She started having "seizures" or "staring episodes" and her eyes started getting blurry or double vision at times in June 2008. She was so sick she was admitted to the hospital that month. The only thing they found was SVT. Feb 2009 they found she has hypoglycemia. May 2009 She started having slow speech and started dragging her left leg. June 2009 Both legs started feeling "tingly" and heavy- she couldn't support herself all the time. She is in a wheelchair more that not, or uses a walker the rest of the time. She can't speak at all at times- it comes out like baby jibberish or child like speach. July 2009 she started retaining water?? We noticed she had cushy bags on her back that come and go. Also that month she started "gagging" like she was going to throw up, but nothing comes out- except maybe a burp. Everyday she feels sick. Her life has completely been ruined becuase she is too sick to do anything. We have taken her to several types of doctors, but they said they think it is a "conversion disorder" because they haven't found what is causing it all. I know better than that. It is a cop-out to label it as that just because they don't know what is wrong. All these symptoms started after she had the Gardasil Vaccinations. I know this has caused the problems! 9/17/09 ER / hospital records received 4/5/08 to 5/27/09. Many visits and complaints, extensive diagnostic testing. Assessment: Left side weakness, aphasia. Conversion disorder. Originally presents with pelvic pain and a history of cysts. Epigastric pain. Right ovarian cysts. Sinus tachycardia, syncopal episode. Thyroid nodule. Patient later presents with difficulty standing, imparied speech, stuttering, difficulty walking, dragging (L) foot, weak grip. Subsequent visits: tachycardia, abdominal pain, elevated lactate. Presented to emergency room with many episodes of shaking, blurred vision, and could not talk. Begin as a "lightness" or "tightening sensation" all over body. Fever. Panic attacks. Fatigued and tired.

Other Meds: 9/17/09 ER records received 4/5/08 to 5/27/09. NuvaRing.

Lab Data: 3/27/08 urinalysis w/o 6/21/08- CT. 6/22/08 Echo, transthoracic (2D), doppler, cardiography color flow velocity mapping. 6/23/08 MRI brain w/o contrast- ultrasound pelvic. 6/25/08 Ultrasound soft tissue head/neck/thyroid. 7/10/08 EEG.

History: 9/17/09 ER records received 4/5/08 to 5/27/09. Thyroid cyst. Ovarian Cyst. 10/05/09 Vaccine records received: HPV #2, Merck, given 10/15/08, lot# 1061U, RA; Adacel, Sanofi, given 10/15/08, lot# C2768BA, LA; Twinrix, given 10/15/08, no lot # provided.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abnormal behaviour, Mental disorder

Symptom Text: Shortly after receiving third dose of immunization, my daughter began to demostrate unusual psychological behavior. Atmosphere of self-destructiveness and potential Bi-Polar elements came about. As example, being in her senior year of highschool, she had scheduled several college visits and held a good deal of excitement about going to college for psychology or special education. Within a short time of receiving this vaccine, her performance in school tanked, she stopped visiting schools and began alienating her friends. In January she met a young man, got ingaged in 5 weeks, moved out 8 weeks later(still in school) and got married. I realize this could appear as a parent looking for an excuse for a child's ill behavior but the dramatic change and lack of having any accountability for actions, still, is at an unnerving level. Conversations with her still indicate no ability to understand impact of actions, behavior is completely reactionary. I also want to add that this is not only something which her parents noted, but her guidance counselor, her teachers and even the support counselor. On the last day of school the support counselor pulled me aside, knowing all that had changed overnight and said "There is something dramatically wrong with your daughter - her wiring has gone haywire, there's more to this than a child acting out". Would like to know if there are any other reports of psychological issues on other patience

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Dizziness, Loss of consciousness, Nausea, Paraesthesia

Symptom Text: Within seconds of receiving vaccine, I felt like I was going to pass out, nurse instructed me to lie down on table, she left and I passed out. This occurred probably within 30 seconds total after receiving vaccine. Ambulance arrived and while being transported to hospital, I felt tingling in hands and fingers and also felt incredibly nauseous. Also felt I was going to pass out again, but didn't. Arrived at hospital, still feeling nauseous and had many tests. Due to having a history of seizures and syncope, gynecologist and doctors at hospital dismissed symptoms as being anxious over having shot. I have given blood several times in the past few years and never passed out from that. It has been 8 months since vaccine and no other symptoms have occurred.

Other Meds: Sprintec 28-day

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abdominal pain, Diarrhoea, Dizziness, Dysstasia, Pyrexia, Sleep disorder, Vaccine positive rechallenge

Symptom Text: I've had the same reaction to GARDASIL on both shots. The first shot I initially forgot about, on account of I was injected with three vaccines at once. The second shot I had today at 4:30 ish, and my symptoms began around 9:00. I began to have severe diarrhea until I began to have an absence of stools, and began to just have pure water in my bowel movements. It has continued for at least five hours, and shows no signs of stopping. I also have severe cramping in my abdomen, and seem to have a high fever. I cannot hold water or slight food in my stomach; it makes it worse to even drink. So now, I feel very faint and have a hard time sitting and standing. The first shot was much of the same. I was up all night with watery stools, and was told to report this adverse effect to the FDA.

Other Meds:

Lab Data: I have not had any relevant tests done to support my claims, because it was always late at night when my problems started, and our hospital isn't the best to be treated by.

History: I have no other relevant history. I don't have any drug uses or allergies. I haven't had any pre-existing conditions that could cause me to be so severely sick as I am.

MedDRA PT Convulsion, Dizziness, Nausea, Syncope, Vomiting

Symptom Text: Information has been received from a health professional concerning a 9 year old female who on 30-JUL-2009 was vaccinated with GARDASIL first dose. There was no concomitant medication. On 30-JUL-2009 after the vaccine was administered, the patient experienced faint and convulsion (characterized by spastic contractions in hands and foot), after a few seconds, the patient recovered from faint and convulsion and referred that she felt dizziness, nausea and presented 2 episodes of vomiting, the reporter stated that patient did not require hospitalization. The patient under went observation for 45 minutes and recovered from dizziness, nausea and vomiting. The reporter stated that the patient hasn't neurological pathology history. The reporter stated that the patient's mother considered convulsion, dizziness, faint, nausea and vomiting were not related to therapy with GARDASIL, but were related to patient's "nervousness" before the vaccine administration. Upon internal review convulsion was considered as OME. No further information is available.

MedDRA PT Activities of daily living impaired, Convulsion, Fall

Symptom Text: Information has been received from a consumer via CSL as part of a business agreement and internet website concerning a 13 year old female patient with asthma who in approximately 2008 was vaccinated with a dose of GARDASIL, that she received under the government's free cervical cancer vaccination program. Following the injection, the patient was barely at school for a month when the patient was rushed to the hospital from school. It was reported the patient was "touch and go" for a week and "stared death in the face". The seizures were reported to last for four months. It was further reported that the students tried to trigger her epilepsy like seizures. By whistling suddenly in her ear caused her to fall to the ground and have a fit. Her mother reported that she was called to school probably twenty times in four months. The students also tried to bring on an asthma attack by spraying aerosol in her face. The article mentioned that the patient stood up to the school bullies who hurled verbal abuse and tried to trigger her epilepsy-like seizures and asthma. Additional information is not expected.

MedDRA PT Asthenia, Grip strength decreased, Hypoaesthesia, Paraesthesia

Symptom Text: Information has been received from a physician concerning a 25 year old female who on 07-AUG-2009 was vaccinated with a dose of GARDASIL (lot# 661766/0652X, dose and route not reported). On 07-AUG-2009, the patient experienced "weakness, numbness and tingling in both of her hands and fingers" after receiving GARDASIL. The physician stated the patient had this reaction "later in the day but on the same day the GARDASIL was given". The patient complained that she was "unable to turn the ignition in her car to start her car". It was unspecified if medical attention was sought. At the time of the report, the patient's status was unknown. Follow up information was received on 17-AUG-2009 from the physician concerning the 25 year old female with no pertinent medical history and no known drug allergies who on 07-AUG-2009 was vaccinated with the first dose of GARDASIL. There was no concomitant medication. No other vaccines were administered on that day. No treatment was sought following the adverse events. The patient called in to office on 10-AUG-2009 to report event. The patient was not recovered as of 10-AUG-2009. The events of "weakness, numbness and tingling in both of her hands and fingers" were considered to be "somewhat" disabling. Additional information has been requested.

MedDRA PT Arrhythmia, Blood test, Cardioversion, Chest pain, Dizziness, Dyspnoea, Electrocardiogram, Palpitations, Supraventricular tachycardia

Symptom Text: Information has been received from a registered nurse and a certified medical assistant concerning a 16 year old female with migraine headaches and allergy to cephalosporin who on 27-JUL-2009 was vaccinated with a 0.5 ml IM first dose of GARDASIL (lot no. 661953/1130X). No other vaccines were given that day. Concomitant therapy included ORTHO EVRA. On 28-JUL-2009 the patient stated she developed a rapid heart rate "it feel like it was rushing out of my chest", standing cause her to loose her breath and dizziness. The symptoms continued through the entire day and into the next. On 29-JUL-2009 the patient was seen at emergency room and was diagnosed with supraventricular tachycardia (SVT) with a heart rate of 200 (bmp). The patient was not hospitalized. The patient underwent cardioversion and was released with heart rate in the 90's (sinus rhythm). On an unspecified date, the patient recovered from supraventricular tachycardia. A blood work and a electrocardiogram (EKG) was performed (results not reported). The patient is being followed by a cardiologist and another physician who reported that holter monitor results were "fine." The reporter stated that supraventricular tachycardia was not related to therapy with GARDASIL. Supraventricular tachycardia was considered to be life threatening an other important medical event. A lot check has been initiated. No further information is available. 8/28/09 ER records received DOS 7/29/09. Assessment: Arrhythmia - Supraventricular tachycardia. Patient complains of palpitations and heart racing. Chest pain and difficulty breathing. 10/13/09 ICD-9 Codes received: 427.89 Other specified cardiac dysrhythmia, 780.4 dizziness, 786.05 paroxysmal nocturnal dyspnea, 785.1 palpitations, 785.0 Tachycardia unspecified.

Other Meds: ORTHO EVRA

Lab Data: cardiac monitoring, results were fine; total heartbeat count, 07/29/09, 200, beats per minute; total heartbeat count, 07/29/09, 90, sinus rhythm. At discharge. 8/28/09 ER records received DOS 7/29/09. LABS and DIAGNOSTICS: Pulse 184. CBC

MedDRA PT Hypotonic-hyporesponsive episode, Incorrect route of drug administration, Syncope

Symptom Text: This is a case of a misuse (GARDASIL was administered by subcutaneous route when according to the SMPC intramuscular vaccination is indicated). Initial information received on 12-AUG-2009 by the Health Authority (reference number ES-AGEMED-031435340) regarding a 12 year old female who on 22-MAY-2009 was administered a dose of GARDASIL (batch number not reported) by subcutaneous route, site of administration not reported and a dose of TWINRIX (manufactured by GSK) by subcutaneous route, site not reported. According to Health Authority's report narrative the patient suffered a hypotonic-hypoactive reaction. In the adverse event box vasovagal syncope was coded with start date on 22-MAY-2009 and end date on 22-MAY-2009. Case reported as serious by the Health Authority with other medically important condition as criteria. Case is closed. Other business partner numbers included: E2009-07984. No further information is available.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse concerning a female who was vaccinated with the first and second dose of GARDASIL, lot number (s) not available. Subsequently the patient just found out that she is pregnant. Additional information has been received on 10-AUG-2009 from the nurse who reported that the patient experienced a miscarriage and that patient was not being seen at the clinic at this time (no further details available). Upon internal review, miscarriage was considered to be an other important medical event. No further information is available.

MedDRA PT Affect lability, Alopecia, Back pain, Demyelination, Disturbance in attention, Dizziness, Dry eye, Dyspnoea, Extraocular muscle disorder, Fatigue, Fibromyalgia, Gait disturbance, Gastrointestinal disorder, Headache, Heart rate increased, Hoffmanns sign, Hypoaesthesia, Hypophagia, Immediate post-injection reaction, Initial insomnia, Insomnia, Intervertebral disc protrusion, Livedo reticularis, Muscle spasms, Muscle twitching, Musculoskeletal pain, Nausea, Nuclear magnetic resonance imaging abnormal, Nuclear magnetic resonance imaging brain normal, Pain, Pain in extremity, Paraesthesia, Post lumbar puncture syndrome, Raynauds phenomenon, Reflexes abnormal, Restless legs syndrome, Sensory loss, Spinal haemangioma, Stress, Stress urinary incontinence, Wheelchair user

Symptom Text: Light-headed, dizzy, and nauseous immediately after vaccination. Since vaccination: headache, severe fatigue, numbness/tingling in extremities, sharp lower back pain, shoulder pain, hair-loss, memory 'fog'/concentration difficulties, breathing problems, muscle twitching, leg/arm cramping, insomnia, rapid heart beat, overall soreness, GI problems. 9/28/09 Neurology consult received DOS 2/13/08 to 6/6/2008 Assessment: Fibromyalgia. Restless leg syndrome. Patient presents with chronic lower back pain and paresthesias. Developed numbness and tingling "pins and needles" affecting anterior thighs/lower extremities and upper extremities, also including left hand. Gait affected, using wheelchair. Decreased sensation to light touch, pinprick and vibration right upper and lower extremities. Reflexes asymmetrical. Hoffman sign on right. Involutary loss of urine with activity. Post LP headaches, nausea, not eating or drinking very much. Muscle twitching. Difficulty falling asleep. 9/28/09 Rheumatology consult received DOS 2/15/08 to 2/29/08. Assessment: Likely demyelinating process of unclear etiology. Post lumbar puncture headache. Emotional lability brought on by stress of current illness. Patient c/o "legs falling asleep", lower back pain, "pins and needles" right and left arms. Thinning hair. Atypical Raynaud's symptoms, fingers appear dusky, livedo orver dorsum of hand. Eyes dry. Disconjugate movements extraocular muscles.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Activities of daily living impaired, Altered visual depth perception, Asthenia, Balance disorder, Condition aggravated, Confusional state, Disability, Disorientation, Dizziness, Epistaxis, Fall, Fatigue, Gait disturbance, Headache, Injection site pain, Movement disorder, Nausea, Pain, Pain in extremity, Visual impairment

Symptom Text: From the time of vaccination until about a month after, I experienced moderate pain in my left arm at the injection site and in the entire arm and had pain when trying to move it. By that time, school had started on Sept 26, and over the course of the next few months and to the present I began to (and still) experience weakness, dizziness, and fatigue, sometimes with episodes of confusion or disorientation. No matter how much rest or sleep I get, I still experience those symptoms. Also during this same time period, I began to get chronic headaches that varied in severity and struck suddenly during everyday activities. I know for a fact that the headaches were neither due to dehydration or heat stroke because I drink 2 liters of water daily and it was the winter season. In late 2008, around early December, I began to notice something off in my vision. It seemed that when I looked at straight lines, like edges of a wall or a doorframe, etc, the surfaces seemed to shake. All of my symptoms persisted into the new year and the dizziness and vision problem worsened. During January 2009, I started to become so dizzy that it began to affect my balance. I would start stumbling or have errors in depth perception and walk into walls or other solid objects. The vision problem, after doing some online research, I believe is a condition called nystagmus, started to affect not just straight-line figures in my vision, but all shapes and figures. Soon I was seeing my entire environment seem like it was all vibrating or oscillating from side to side or up and down very rapidly. These symptoms, along with the dizziness continued up until February 27, 2009. On the morning of Feb 27, at 8:00a I had just woken up and started to brush my teeth when blood started streaming out of my nose. I hadn't irritated my nose by blowing it or picking it and my nose wasn't too dry either. It was a completely random occurrence. It just started bleeding and it wouldn't stop. Within five minutes' time so much blood had flowed out that it was all over

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Convulsion, Gaze palsy, Loss of consciousness, Syncope, Tremor

Symptom Text: Information has been received from a physician and an other medical professional concerning a 13 year old female with no pertinent medical history and no known drug allergies who was vaccinated with the first 0.5ml dose of GARDASIL (Lot#660553/0070X) on 18-JUN-2009 in the right arm. Other vaccines given that day included: HAVRIX (unspecified) (GSK) (Lot#AHAYB296BA) and ADACEL (Sanofi Pasteur) (Lot#C2826AA). There were no other concomitant drugs. On 18-JUN-2009, after receiving the first dose of GARDASIL, the patient's eyes rolled back in her head and she fainted while in the office. While she was unconscious the patient experienced "seizure-like head shaking". The other medical professional said there was nothing definitive in the chart to confirm or negate a seizure, as the physician was in another room when the event occurred, chart showed "seizure-like head shaking". The patient had sought medical attention, in the office. There were no diagnostic tests performed. The patient was not sent to emergency room. There was no treatment required. The event was not disabling. At the time of report the patient's status was recovered. Upon internal review, "seizure-like head shaking" was determined to be an other medical event. Additional information has been requested.

MedDRA PT Back pain, Convulsion, Grand mal convulsion, Headache, Injection site erythema, Injection site swelling, Joint range of motion decreased, Musculoskeletal stiffness, Neck pain, Pain, Syncope

Symptom Text: Information has been received from a medical assistant concerning her 15 year old sister with no known drug reactions/allergies and no known pertinent medical history who on 30-AUG-2008 received the first dose of GARDASIL (Lot # 655849/0263U) into the right arm. On 08-AUG-2009 was vaccinated with the second dose of GARDASIL (Lot # 662300/0100Y). Concomitant vaccine included Tetanus toxoid and MENACTRA (Lot # U2662A). The medical assistant reported that after second vaccine the patient experienced injection site swelling and redness. On 11-AUG-2009, in the afternoon, the patient fainted on the sports field (according to the medical assistant the event was not environmentally connected); the syncope was followed by a 30 second convulsion which was witnessed by the coach; when the patient came out of it, she had a pounding headache which lasted a week; patient refused any treatment at the time. The patient saw a neurologist on 13-AUG-2009. On 17-AUG-2009, an MRI of head, MRI of neck and EEG were performed (results not expected until 25-AUG-2009). At the time of reporting the patient was recovering. The patient sought medical attention. Upon internal review seizure was considered to be other important medical event. Additional information has been requested. 8/27/09 Neuro consult received dated 8/13/09 with assessment: Cervicalgia-worsening, Convulsions-new, Headache, worsening. Pt presented after episode of generalized tonic-clonic seizure. Pt also reports daily H/As x 1 year-recently worse, neck and back pain and stiffness. PE (+) for trigger points and mildly decreased ROM of the neck. Sent for testing. PT for neck.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Cervical conisation, Cervical dysplasia, Cervix carcinoma stage 0, Cervix inflammation, Condition aggravated, Papilloma viral infection

Symptom Text: Information has been received from a physician concerning a 26 year old female with papilloma viral infection (Type 16, 58) who in November 2007, was vaccinated with GARDASIL vaccine. In May 2006, the type 16 and 58 of human papilloma virus were detected in the Pap smear result. The patient was vaccinated with the first dose of GARDASIL in November 2007, the second dose of GARDASIL in January 2008, and the third dose of GARDASIL in May 2008. In January 2009, the patient was diagnosed with the cervical intraepithelial neoplasia (CIN) phase I. In June 2009, the patient was diagnosed with the cervical intraepithelial neoplasia (CIN) phase II. This patient was referred to another hospital for the operation of the cervical conization (It was not reported that the patient received the conization). The reporting physician felt that cervical intraepithelial neoplasia was not related to therapy with GARDASIL vaccine. On 13-AUG-2009 the additional information has been received from a physician via the company sales representative. In May 2006 the patient received the Pap smear test, and the result was the class II (inflammation) and type 16 and 58 of human papilloma virus were detected. In May 2007 the patient received the Pap smear test, and the result was the class III (Cervical low grade intraepithelial lesion) and type 16 and 58 of human papilloma virus were detected. In January 2009 the patient received the Pap smear test again, and the result was the class II (inflammation). In June 2009 the patient received the Pap smear test again, and the result was the class IV. The patient was diagnosed with cervical carcinoma in situ. The reporting physician felt that cervical carcinoma in situ was not related to therapy with GARDASIL vaccine. The cervical carcinoma in situ was considered as other medically important event. No further information is available.

Other Meds: Unknown

MedDRA PT Activities of daily living impaired, Decreased appetite, Ear discomfort, Ear pain, Headache, Mobility decreased, Nausea, Otitis media, Pain, Pelvic pain, Rhinorrhoea, Screaming, Sinus congestion, Sleep disorder, Tinnitus, Tympanic membrane disorder, Vomiting

Symptom Text: Information has been received from a nurse concerning her approximately 14 year old granddaughter with no pertinent medical history and no known allergies, and a family history of paternal Aunt with cervical cancer and paternal grandmother with cervical cancer who in late 2007 was vaccinated with the first dose of GARDASIL (lot number not reported). On an unspecified date the patient was vaccinated with the second dose of GARDASIL (lot number not reported). In June 2008 or July 2008 the patient was vaccinated with the third dose of GARDASIL (lot number not reported). There was no concomitant medication. 2 or 3 days after the first dose, the patient started having headaches. The headache increase after the second dose was given. The patient was put on NAPROSYN to help the headache (start date not reported0. The headache was worse after the third dose. On an unspecified night the patient woke up screaming at 2 am because of a headache. The patient was sent to the emergency room. No lab diagnostics studies were performed. The patient was put on PERCOCET (start date not reported). There have been times when the patient was throwing up and couldn't get her head off the pillow. The headaches have gotten worse and worse to the point of making the patient nauseous. It was noted that when the headache gets real bad the patient can't get out of bed. 3 months after the third dose, the patient developed ringing of the ear. The nurse felt that the ringing in the ear experienced was associated with the headaches. At the time of the report, the patient had not recovered. It was noted that the patient's father's sister and the patient's father's mother had cervical cancer. The headache was considered to be disabling by the nurse. Additional information has been requested. 9/2/09 ER records from 2 visits 4/17/09 and 5/2/09 received with dx: Serous Otitis and Vomiting/H/A. Pt initially presented 4/17/09 with c/o ear pain, ringing and fullness x 3 days. Recent ear injury. L TM bulging. Tx: nasal spray. Returned 2 weeks later

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, SERIOUS

MedDRA PT Dizziness, Heart rate increased, Hypoaesthesia, Laboratory test, Tuberculin test

Symptom Text: Information has been received from a physician concerning a 15 year old female with a diagnosis of anxiety on 10-JUN-2009, no drug allergies and no other medical history, who on 11-AUG-2009 was vaccinated with her first dose of GARDASIL (IM, lot # unspecified). Suspect therapy included MENACTRA. There was no other concomitant medication. Two hours after the vaccination, the patient developed numbness to her arms and hands, lightheadedness and increased heart rate. Several hours after the symptoms began the patient was taken to the emergency room (name of hospital was not specified) by squad. The patient was released home from the emergency room. A few days later the symptoms continued and the patient was hospitalized for 48 hours (diagnosis not specified). The patient had been in the physician's office for follow up appointments on 12-AUG-2009, 20-AUG-2009 and on 10-SEP-2009. Labs and diagnostic tests included PPD skin test on 11-AUG-2009. Tests were completed (types of tests and results were not specified). At the time of the report, the patient had recovered (date unknown). Additional information has been requested.

MedDRA PT Multiple sclerosis, No reaction on previous exposure to drug

Symptom Text: Case received from the Health Authority on 17-AUG-2009 under the reference number PEI2009017737. Information has been received from a physician concerning an 18 year old female patient who on 27-MAY-2009 was vaccinated with the third dose of GARDASIL (lot#, route and site of administration not reported). In June 2009, the diagnosis of multiple sclerosis was established via cranial and spinal MRI. Other inflammatory nerve diseases were ruled out. The event was considered as life-threatening by the reporter and the patient was admitted to hospital (unspecified). The reporter stated a "persisting damage". Previous two vaccinations with GARDASIL (Dose1: 23-OCT-2007; Dose 2: 21-JAN-2008) were well tolerated. Other business partner numbers included: E2009-08024. Additional information has been requested.

MedDRA PT Activities of daily living impaired, Dizziness, Fatigue, Headache, Heat exhaustion, Hyperhidrosis, Malaise, Nausea, Syncope, Vertigo, Vomiting

Symptom Text: Information has been received from a physician concerning a 17 year old female patient who on 05-AUG-2009 was vaccinated intramuscular with the first and only dose of 0.5ml GARDASIL (lot # 663452/0671Y). Secondary suspected therapy included VARIVAX administered on 05-UG-2009. Other concomitant therapy included ADVAIR and MENACTRA administered on 05-AUG-2009. On 06-AUG-2009 the patient developed exertional vertigo and extreme fatigue. The patient was a Division 1 softball player and she had not been able to participate due to these symptoms. On 18-AUG-2009 the patient had syncope and ended up in the emergency room. she was not admitted. She will be seen in the office on 19-AUG-2009. The patient had sought the physician for medical attention on 11-AUG-2009. The patient had not recovered. The patient's exertional vertigo, extreme fatigue and syncope were considered to be disabling. Follow up information has been received from the physician concerning the 17 year old female patient who on 15-AUG-2009 had concomitantly received the second dose of VARIVAX (LOT# 664701/0726Y) and MENACTRA (LOT # U291944). On 18-AUG-2009, the patient had syncope and was taken to the Emergency room. The patient had a CT scan and laboratory tests. All testing was negative. The patient was not admitted to the hospital. The patient was seen by the physician on 19-aug-2009. The patient complained of nausea, dizzy and light-headedness on exertion. The physician stated that he was going to refer the patient to a cardiologist for evaluation. Additional information has been requested. 9/3/09 Received ER medical records of 8/18-8/19/2009. FINAL DX: dizziness w/evidence of mild heat exhaustion; possible HPV vaccine side effects. Remained stable & d/c to home w/PCP f/u. Records reveal patient experienced dizziness & malaise since vaccines, with nausea & vomiting while playing sports on day of admission. 9/8/09 Received PCP record of 8/19/09 & vaccine records. FINAL DX: syncopy & nausea Records reveal seen in ER w/neg w/u. Recovered. 11/

Seriousness: HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Blood product transfusion, Contusion, Haemorrhage, Idiopathic thrombocytopenic purpura

Symptom Text: Information has been received from a consumer concerning her 19 year old daughter who in Summer 2007 was vaccinated with the first dose of 0.5ml GARDASIL. No information was provided for the second dose of 0.5ml GARDASIL. On 06-NOV-2007 the patient was vaccinated with the third dose of 0.5ml GARDASIL. There was no concomitant medication. On 31-JUL-2009 the patient developed "Idiopathic Thrombocytic Purpura". The consumer stated that "when blood passes through the patient's spleen the antibodies are killing her platelets causing massive bruising and internal bleeding". The patient was hospitalized on 31-JUL-2009 for 4 days. The patient's platelet count was back up after hospitalization, but was going back down again. Laboratory included blood work without result. The patient had not recovered. Additional information has also received from a medical assistant reported that the patient was vaccinated with the first, second and third dose of GARDASIL separately on 05-MAR-2007 (lot # 655849/0263U), 06-JUL-2007 (lot# 658100/0525U) and 06-NOV-2007 (lot # 655154/1210U). No other vaccines given concomitantly. In September 2008, the patient was placed on birth control. Information has also been received from a physician reported that in November 2007, the patient's blood work was normal. On 03-OCT-2008, the patient's platelet count was 190,000. On 30-JUL-2009, the platelet count decreased to 21,000 and the patient was hospitalized the next day it's on 31-JUL-2009. The patient was treated with IV immunoglobulin and steroids. Patient was currently on the titrating dose of prednisone. The physician considered the condition to be disabling but not life threatening. The physician dose not know if GARDASIL was the cause of this event. The patient referred to a hematologist. The receptionist of the hematologist reported that their office was not treating the patient so that the patient might have been treated elsewhere. Additional information has been requested.

MedDRA PT Convulsion

Symptom Text: Information has been received from a Nurse Practitioner (N.P) concerning a teenager female patient who on an unspecified date was vaccinated with the first dose of GARDASIL. It was reported that the patient had a seizure after GARDASIL was given. It was reported that the patient went to the emergency room, but it was unknown if the patient was admitted to the hospital. The patient was not given GARDASIL in this nurse practitioner's office but this nurse will be following up with this patient next week. It was also reported that the patient had a first appointment scheduled with the Nurse Practitioner sometime next week (date unknown). The Nurse Practitioner stated that she had spoken to the patient's mother who explained that 30 minutes after receiving the first dose of GARDASIL, the patient had a seizure in the parking lot. The outcome of the patient was unknown at the time of the report. Upon internal review seizure was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Injection site induration, Injection site pain, Injection site swelling

Symptom Text: Adverse event onset was 8-08-09 - Client noticed a knot and soreness at injection site on (L) arm. By the next day, soreness, swelling, hardness, and vein enlargement were noted at the bend of the arm on the inner aspect. Area today is only slightly swollen, but remains sore to touch. Vein running along the inner aspects of the (L) mid arm is slighly larger and harder than vein in (R) arm. Client has been applying cold compresses and taking OTC pain/inflammatory medication with some noted improvement, but problem is better one day and then worse the next. Client is concerned.

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Agitation, Alcohol abuse, Anxiety, Attention deficit/hyperactivity disorder, Bipolar disorder, Disorientation, Distractibility, Drug abuse, Hallucination, Irritability, Paranoia, Schizophreniform disorder, Suicidal ideation

Symptom Text: First acute schizophrenic episode (disorentation and hallucinations)occurred 3 days after HPV vaccination. Required hospitalization and continues to need ongoing treatment. Unable to return to school and usual activites. 11/2/09: Hospital Records and Discharge Summary received for dates of service 4/16/09 to 5/4/09. Dx: Schizoaffective disorder, bipolar type, attention deficit hyperactivity disorder, cannabis abuse, alcohol abuse. Assessment: Pt. brought to hospital ED by local police on a certificate of hold after being missing for 1 day and being found wandering, distracted and responding to internal stimuli. She was anxious, irritable and easily agitated. She had stopped taking her psychiatric medications several weeks before. She displayed prominent thought blocking with loose associations and was having visual and auditory hallucinations. With the help of psychiatric medications, by discharge her affect became broader, mood brighter there was no further thought blocking, thought process was more organized, and she was A&O x 3. 11/2/09: Hospital Records and Discharge Summary received for dates of service 6/18/09 to 6/23/09. DX: Schizoaffective disorder, bipolar type, attention deficit hyperactivity disorder. Assessment: Brought to the Hospital ED by police after threatening to shoot herself, though she had no access to a gun. She had stopped taking psychiatric medications 3 days prior. She was intrusive and tried to escape from the ED, so was medicated with good effect. On assessment she was paranoid and guarded, however she denied suicidal or homicidal ideations. Appeared to be responding to auditory hallucinations and other internal stimuli. While hospitalized, her medications were re-started, her thought processes became logical and coherent. She did not appear to be guarded anymore. Her insight, judgment and impulse control were improved and fair at time of discharge.

Other Meds: Trileptal, Concerta

Lab Data: 11/2/09: Hospital Records and Discharge Summary received for dates of service 4/16/09 to 5/4/09. Labs and Diagnostics: CBC-WNL, Urine Drug Screen, Negative. 11/2/09: Hospital Records and Discharge Summary received for dates of service

History: Bipolar Disorder, ADHD, Allergic to Amoxicillin 11/2/09: Hospital Records and Discharge Summary received for dates of service 4/16/09 to 5/4/09. PMH: Drug and alcohol abuse, ADHD, allergy to Amoxicillin. 11/2/09: Hospital Records and Discharge Summary received for dates of service 6/18/09 to 6/23/09. PMH: As above.

MedDRA PT Headache, Hemiparesis, Neurological symptom

Symptom Text: Information has been received from a cardiac surgeon concerning a female who was vaccinated with a dose of GARDASIL (lot #660618/0572X). Subsequently the patient developed hemiparesis, headaches and "other neurological symptoms". At the time of the report, the patient's outcome was unknown. The cardiac surgeon considered hemiparesis, headaches and "other neurological symptoms" to be were considered to be disabling since they have become longstanding and incapacitating. This is one of several reports received from the same source. A lot check has been requested. Additional information has been requested.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Agitation, Anorexia, Asthenia, Balance disorder, Gait disturbance, Headache, Lymphadenopathy, Malaise, Muscular weakness, Nausea, Oropharyngeal pain, Parosmia, Phonophobia, Photophobia, Physiotherapy, Pyrexia, Viral infection, Wheelchair user

Symptom Text: Initial and follow-up information was received from a physician and a cardiac surgeon concerning his 15 year old daughter with no known drug allergies and had no significant medical history who was described as a healthy girl. She was an active flutist, accomplished and participating in an adult orchestra in her hometown, a soccer player and track runner. On 26-AUG-2008, she was vaccinated with first dose of GARDASIL (Lot # 660555/0279X) and her second dose was administered on 03-DEC-2008 (Lot #660618/0572X). There were no concomitant medications or vaccinations. About mid February 2009 she started to develop what seemed at the time like a viral illness with a sore throat, felt unwell, developed a low grade fever and swollen glands. She rapidly progressed to severe headaches which were accompanied by nausea, photophobia, phonophobia, sensitivity to odors and a complete loss of appetite. The patient also developed severe lower limb weakness and balance/gait disturbance. A multitude of testing including two magnetic resonance imaging (MRI's), electromyography (EMG's), neurovascular checks (NVC's) and multiple labs had been unrevealing. She had been out of school since February 2009 with home tutoring. She became interested in nothing but laying on the couch in a dark and quiet room. She had been unable to tolerate her flute, and had no stamina for any activity including soccer and track. On 26-FEB-2009 the patient saw a doctor, to investigate if the patient was experiencing migraine headaches. Standard migraine treatment including IV DEPAKOTE had not been helpful. The patient was also treated with LORTAB and IMITREX which did not help. Her headaches worsened and were described as a 10 out of 10 on the pain scale and she began to have difficulty walking. She was then sent for a neurology consult and was treated with DEPAKENE and ANTIVERT with no effect. The patient had a battery of laboratory testing done (not otherwise specified) which revealed nothing. On 06-MAR-2009 the patient was seen in the Emergency Room (ER)

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Arthralgia, Dermatomyositis, Dysphagia, Fatigue, Hepatic enzyme abnormal, Hypersomnia, Immune system disorder, Injection site pain, Lymphadenopathy, Muscle fatigue, Myalgia, Oropharyngeal pain, Pain, Rash erythematous, Rash generalised, Rash pruritic

Symptom Text: 1st vaccine: 11/28/08; Rash on hands appeared soon after, seen by Dr. on 12/7/09 for rash; 2nd vaccine: 2/7/09; 3rd vaccine: 5/1/09 followed by extreme tederness at site and muscle fatigue and pain all over body; numerous doctor visits, tests, and muscle bioposies led to diagnosis on 8/6/09 of dermatomyositis by Dr. During this period (11/28/08 - 5/1/09) rashes also appeared on elbows, knees, hips, and face. In looking back over the time period, there appears to be a connection between the vaccinations their impact on her immune system. Medical literature suggests a possible link between Gardasil and juvenile dermatomyositis, a disease that only affects 5 in 1 million people. 9/1/09 PCP medical records received DOS 2/3/09 to 8/19/09. Assessment: Nonspecific liver enzyme elevation. Nonspecific myalgias, joint complaints, possible rheumatological disorder. On 5/1/09 patient presented with complaints of a red, puritic rash. On the dorsum of and fingers of both hands, concentracted around MCP joints. Later complains of achiness and fatigue on arms and legs, sleeping more. Rash on elbows and knee. 1/7/2010 ED records received. Service date 6/29/09. Assessment: Lympahdenopathy, difficulty swallowing. Patient c/o that it is hard to swallow. Cervical lymphadenopathy. Body aches. Myalgia, sore throat, rash.

Other Meds: None prior to 5/1/09

Lab Data: Patient has had numerous blood tests, skin biopsies, muscle biopsies. Muscle biopsy conducted by University of Iowa confirmed diagnosis of dermatomyositis. 9/1/09 PCP medical records received DOS 2/3/09 to 8/19/09. LABS and DIAGNOSTICS: E

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Convulsion, Dizziness, Inappropriate schedule of drug administration, Loss of consciousness, Overdose, Pallor, Syncope

Symptom Text: Information has been received from a physician and a licensed practical nurse concerning an 18 year old female who on 11-OCT-2006, 21-FEB-2007, 21-JUN-2007 and 18-AUG-2009 was vaccinated with her first, second, third and fourth dose of GARDASIL respectively (lot # are 653735/0688F, 655165/1425F, 657868/0523U and 661952/1129X respectively). Suspect vaccination included a second dose of VAQTA (inactive) (dose 2). Concomitant therapy included MENACTRA (lot#U2866AA) and ADACEL (lot # 3068AA). The nurse stated that she did not see the third dose of GARDASIL documented in the patient's vaccination chart. The nurse stated the patient was given the fourth dose of GARDASIL in error. On 18-AUG-2009, after the patient had received the vaccination she felt dizzy and had syncope. The patient had loss of consciousness for about 10 seconds. The patient regained consciousness. The patient was pale, blood pressure 110/70, Oxygen Saturation on room air 98%. Oxygen was administered, Oxygen Saturation increased to 100%. The patient was observed for 30 minutes with blood pressure 102/62. When the patient stood she felt dizzy. The ambulance was notified and the patient was taken to hospital. The patient was not admitted to the hospital. Per the physician the patient had a seizure after the fourth dose vaccination and was taken to the ER, subsequently the patient was fine. Upon internal review, the seizure was determined to be other important medical event. Additional information has been requested.

MedDRA PT Abdominal pain, Abdominal pain lower, Activities of daily living impaired, Chills, Computerised tomogram, Constipation, Contraception, Diarrhoea, Lymphadenopathy, Nausea, Oral contraception, Ultrasound abdomen

Symptom Text: Information has been received from a Nurse Practitioner concerning a 26 year old female patient with no pertinent medical history and no known drug allergies/drug reactions who in February 2009 was vaccinated with the first dose of GARDASIL with no problems reported. The patient received the second dose of GARDASIL at the beginning of June 2009. Concomitant therapy included hormonal contraceptives (unspecified). It was reported that "three or four weeks after dose two", approximately on 21-JUN-2009, the patient developed nausea and abdominal pain. The patient was seen in the office on 29-JUN-2009 regarding her nausea and abdominal pain. An ultrasound, and computed axial tomography of the lower abdominal quadrant were performed (results not provided). It was reported that "a month after the symptoms began", approximately on 21-JUL-2009, the patient had recovered. Nausea and abdominal pain were considered to be disabling. It was reported that the patient missed work for 1 week. Additional information has been requested. 9/14/09 Medical records received DOS 8/25/08 to 8/27/09. Assessment: Abdominal pain. Patient presents with lower right abdominal pain and lymphadenopathy. Chills, nausea, diarrhea, constipation. Oral contraceptives.

Other Meds: Hormonal contraceptives

Lab Data: Unknown. 9/14/09 Medical records received DOS 8/25/08 to 8/27/09. LABS and DIAGNOSTICS: Colonoscopy - WNL. CBC - WNL. CT Abdomen / Pelvis. Urinalysis (-). Pregnancy test HCG Urine (-). Chest X-ray. US Pelvis.

History: None. 9/14/09 Medical records received DOS 8/25/08 to 8/27/09. Acne vulgaris, Acute pharyngitis Streptococcus, Asthma, contact dermatitis, headache, hematochezia, UTI, laceration left thigh. Vertigo. Falls. Folliculitis. Lymphadenopathy.

MedDRA PT Facial palsy, Horners syndrome, Inappropriate schedule of drug administration

Symptom Text: Information has been received from a physician concerning an unspecified age female who in "JUN-2007", in "AUG-2007" and in "SEP-2008" was vaccinated with a first, second and third dose of GARDASIL respectively (routes and lot numbers not reported). The physician reported that the patient received her third dose of the vaccine in "September 2008" which was over a year from the time that she received the second dose of the vaccine. The physician then continued that in "December 2008", the patient was diagnosed with "Horner's syndrome" and her one eye started drooping. Physician noted that the mother of the patient wanted to know if her daughter's experience is associated with GARDASIL. At the time of the report the outcome of the patient was unknown. The patient sought medical attention by physician's office. On an unspecified date a magnetic resonance imaging was performed results not reported. Upon internal review, Horner's syndrome was determined to be another important medical event. Additional information has been requested.

MedDRA PT Crohns disease, Discomfort, Dizziness, Fall, Immediate post-injection reaction, Joint injury, Syncope

Symptom Text: 11:30am-Pt was given Tdap, HPV, & Meningococcal Vaccine while sitting on exam table. Pt stated she felt "lightheaded" following injections and was instructed to lie down, but pt declined. Very shortly after the pt received immunizations, she fainted. As she was moving from sitting to lying down, she actually slumped forward. The drawer holding some books on the exam table was open. She apparently landed onto the drawer first and then rolled off the drawer landing on the floor. The pt awakened immediately upon becoming supine, as Dr. rushed into exam room upon hearing the loud noise. Initially pt denied discomfort but then did discover that she had some discomfort on the dorsal aspect of her R wrist. The pt was observed closely for quite some time and then allowed to sit up. Even when standing after 15-20 min., she was a little lightheaded. Further questioning revealed pt had no PO intake for the entire day. She was given a couple of glass of apple juice and was brought to parent vehicle via wheelchair. Pt mother was instructed to push fluids for remainder of the day and continue to monitor.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Diarrhoea, Disability, Fatigue, Headache, Malaise, Nausea, Pyrexia, Vomiting, Weight increased

Symptom Text: Information was obtained on request by the company from the agency via a public case detail concerning a 24 year old female patient who on 01-NOV-2008 was vaccinated with a dose of GARDASIL. It was reported that on 01-NOV-2008, after first injection the patient experienced acute fever and nausea (November 2008), and after second injection (December 2008) the patient also experienced acute fever, severe headache, diarrhea, nausea and vomiting. Ongoing fevers, severe fatigue, malaise and relentless weight gain of almost 20 Kg since late 2008. There was symptomatic management. There were extensive pathology investigations performed which included a significant MRI brain (incidental small mass found), chest-X-ray which was normal and CT of abdomen and pelvis which were reported to be normal. It was reported that the patient had not yet recovered. The events of pyrexia, diarrhea, headache, malaise, nausea, vomiting and weight increased were considered to cause incapacity/disability. The agency considered that pyrexia, diarrhea, fatigue, headache, malaise, nausea, vomiting and weight increased were possibly related to vaccination with GARDASIL. The original reporting source was not provided. Additional information is not expected.

Other Meds: Unknown

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Anaemia, Asthenia, Histiocytic necrotising lymphadenitis, Histology abnormal, Leukopenia, Lymphadenopathy, Pyrexia

Symptom Text: Case received from the Foreign Health Authorities on 24-AUG-2009 under the reference number S200908-671 and transmitted by the foreign agency. A 25 year female patient received the second dose of GARDASIL (lot # 0747X, batch # NJ40530) via intramuscular route on 01-MAR-2009. On 15-MAR-2009, the patient developed fever during 3 weeks and asthenia during 4 weeks, and on 31-MAR-2009 she developed asthenia, leucopenia and cervical adenopathy during 4 weeks. The histological diagnosis revealed histiocytic necrotizing lymphadenopathy (Kikuchi-Fujimoto disease). The patient was treated with METAMIZOL and PARACETAMOL. She was not taking any concomitant medication at the time of the administration of the second dose of GARDASIL, nor between the date of administration and the occurrence of the adverse reaction. It was unknown whether the patient had a history reaction to other medicine. At the time of the reporting, the patient had recovered. To be noted in the adverse event field, the Health Authorities described the following adverse events: Fever, lymphadenopathy cervical, asthenia, leucopenia, anaemia and Kikuchi disease, by this order. However in the narrative, there was neither information about anaemia nor any dates of the histological diagnosis of Kikuchi disease. Other business partner numbers include E2009-08174. No further information is available.

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Arthralgia, Autoimmune disorder, Complex regional pain syndrome, Dyspnoea exertional, Joint stiffness, Joint swelling, Oedema, Oedema peripheral, Pain, Pain in extremity, Paraesthesia, Vein disorder, Weight increased

Symptom Text: Information has been received from a consumer concerning her daughter (a 15 year old female) with food allergy and asthma "who received all three doses of GARDASIL but received the first dose of GARDASIL in April, 2007. Concomitant therapy included DEPO-PROVERA. Subsequently the patient started to experience severe pain and swelling in her left hand and arm. The patient saw her pediatrician who sent her to a hand specialist and after several visits the patient was given a CORTIZONE shot (manufacturer unspecified) that did not relieve the pain and then she was casted for two weeks and that did not help either, but then the symptoms disappeared. Then in June 2008 the patient woke up and had severe pain and swelling in her right foot. The patient saw her pediatrician who did several X-Rays and blood work and was sent to an orthopedic physician. The orthopedic physician gave the patient another CORTIZONE shot (manufacturer unspecified) but her foot continued to swell to the size of a small football. The patient then continued to have severe pain all over her body and had achy joints. Then in August, 2008 the patient's left foot became swollen with severe pain. The patient was hospitalized for two or three days where they did a lymph scan, bone scan, cardiac series and blood series. The patient then saw a specialist in October, 2008 who diagnosed her with Complex Regional Pain Syndrome, which was an auto immune disease. The consumer reported that the way this syndrome worked was that she went into remission for sometime and then it would come back. The patient still had swollen feet that got very raw and she was given GABAPENTIN (manufacturer unspecified), CYMBALTA (manufacturer unspecified). The consumer reported that the patient saw a Rheumatologist and a pain specialist." Follow up information was received from a Registered Nurse (R.N.) on via telephone. It was reported that the patient received the first (lot# 656050/0245U), second (lot# 657737/0522U) and third (lot# 658560/1062U) dose of GARDASIL on 16-APR-2007,

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Bedridden, Chills, Hyperhidrosis, Nausea, Pyrexia, Tremor, Vomiting

Symptom Text: Information has been received from a nurse concerning her daughter who was vaccinated with the third dose of GARDASIL (lot # 0858X) expiry 24-JAN-2010. Subsequently, 48 hours after receiving the third dose of GARDASIL, the patient experienced nausea, vomiting, high fever, chills, shaking and sweating. The patient was treated with ADVIL and GRAVOL. Additional information has been received on 19-AUG-2009 from the nurse concerning her 16 year old daughter. The patient presented with symptoms 48 hours after receiving the vaccine and the mother thought that the patient had come down with a flu bug (viral). The fever was treated with TYLENOL and ADVIL and the nausea was treated with GRAVOL. The patient kept to only fluids for 4 days and literally did not get out of bed for 4 days. On day 6 the patient was at the worse of her symptoms. The reporter felt that nausea, vomiting, high fever, chills, shaking and sweating were related to GARDASIL. Upon internal review, the patient's nausea, vomiting, high fever, chills, shaking and sweating were considered to be disabling. No further information is available.

MedDRA PT Activities of daily living impaired, Arthralgia, Pain in extremity, Rheumatoid arthritis

Symptom Text: My daughter had the series of GARDASIL vaccination on 10/3/2007, 12/14/2007 and 4/25/2008. Starting in October, 2008 she started having pain in her feet and by the end of the college year May/June 2009 the pain had spread to her ankle and knee joints. Later in June the pain had spread to all the joints in her body, to the point she had difficulty getting out of bed in the morning. She has since been diagnosed with rheumatoid arthritis. I heard that one of the possible side effects of the GARDASIL vaccinations is auto-immune diseases, so I thought this should be reported.

Seriousness: ER VISIT, HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Encephalitis, Headache, Similar reaction on previous exposure to drug

Symptom Text: Information has been received from a nurse concerning a 16 year old female patient with no pertinent medical history and no known allergies who on 19-SEP-2008 was vaccinated with the first 0.5 ml dose of GARDASIL (lot number 660553/0070X). Secondary suspect vaccination therapy on the same day included the third dose of RECOMBIVAX HB (lot number 657898/1622U). Two weeks later, on approximately 03-OCT-2008, the patient was hospitalized (name and address unspecified) for two months and was diagnosed with encephalitis. On 10-JUL-2009 the patient was vaccinated with the second 0.5 ml dose of GARDASIL (lot number 659054/0315Y). There was no other vaccination therapy on that day. Concomitant medication included birth control (name and manufacturer unspecified). On 31-JUL-2009 the patient experienced a severe headache and went to emergency room (ER) of a hospital. On 31-JUL-2009 a computed axial tomography (CT) was performed and the result was normal ("no acute process"). The patient was not admitted. There was no encephalitis. The patient did not receive the third dose of GARDASIL. The symptom improved after the vaccination therapy was stopped. At the time of the report, the patient had recovered. The nurse added that the information surrounding the first event of encephalitis and hospitalization following the first dose of GARDASIL was not available; the office found out about the experience directly from the patient in August 2009. The encephalitis was considered to be life-threatening by the reporter. No further information is available.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain, Anorexia, Pyrexia, Weight decreased

Symptom Text: Information has been received from a pharmacist concerning a 12 year old female who on 31-JUL-2009 was vaccinated intramuscularly with the first dose of GARDASIL (lot# and site of administration not reported). On 31-JUL-2009, one hour after the administration, the patient experienced persistent dull abdominal pain. The patient was in so much pain, she had to be hospitalized on one occasion. Appendicitis, constipation and any possible gynaecological conditions were ruled out. The patient was febrile (at 102 Fahrenheit) which persisted for weeks. As a consequence to the abdominal pain, the patient was not eating and lost considerable weight. At the time of this report, the patient's outcome was unknown. The pharmacist did not know if the symptoms were related to the vaccine. Additional information has been requested.

MedDRA PT Convulsion, Fall, Headache, Injection site pain, Insomnia, Syncope

Symptom Text: Information has been received from a physician concerning a 19 year old female patient who at the time of vaccination was with fever and congestion, on 02-Dec-2008 was vaccinated with 0.5ml of the "first and only dose" of GARDASIL (lot not reported) intramuscularly. There was no concomitant medication. On the same day of vaccination, 02-Dec-2008, the patient fainted, fell over, and had seizures after receiving her GARDASIL. The patient recovered at the office. She also experienced muscle soreness at the injection site, sleeplessness, and headaches after the vaccination from which she also recovered. Upon internal review seizures were considered to be other important medical event. Additional information has been requested.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Ataxia, Central nervous system lesion, Cerebellar syndrome, Dysarthria, Saccadic eye movement

Symptom Text: Information was obtained on request by the company from the agency via a public case details form concerning a 25 year old female who on 02-AUG-2008 was vaccinated with a dose of GARDASIL. On 02-AUG-2008, the patient experienced severe gait ataxia, moderate dysarthria, ocular dysmetria, slowed saccades, and marked dysmetria and dysdiadochokinesia of the limbs, right more than left onset over 2 weeks in September 2008. The findings were consistent with cerebellar outflow tract lesion. No changes on MRI or CSF studies to indicate multiple sclerosis. No clear response to IV METHYLPREDNISOLONE. The symptoms were improving gradually but had significant ongoing disability. The agency considered that the adverse experiences were possibly related to therapy with GARDASIL. The original reporting source was not provided. No further information is available.

Other Meds: Unknown

Lab Data: magnetic resonance imaging, no changes on MRI study to indicate multiple sclerosis; cerebrospinal fluid analysis, no changes on CSF study to indicate multiple sclerosis

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Acute disseminated encephalomyelitis, Convulsion, Encephalitis, Eye pain, Headache, Muscle spasms, Papillitis, Postictal paralysis

Symptom Text: Information was obtained on a request by the Company from the agency via a Public Case Detail concerning a 24 year old female who on 17-JUL-2007, 04-SEP-2007 and 21-OCT-2008 was vaccinated with three doses of GARDASIL (lot# not reported) respectively. On 23-OCT-2008 the patient experienced acute disseminated encephalomyelitis and was hospitalized. It was reported that in October 2008, the patient developed pain in the right eye and subsequently developed severe bilateral papillitis. In January 2009, the patient developed headache and in early February 2009 developed tonic spasms of the left hand. Following this the patient had a generalized seizure with prolonged left-sided Todd's paresis. Laboratory evaluations of the CSF (cerebral spinal fluid) revealed white blood cell count 89, polymorphs 37% and lymphocytes count 63%. The CSF culture showed a negative result. MRI (magnetic resonance imaging) showed a signal change in right middle cerebellar peduncle and change of right hemisphere meningitis. EEG (electroencephalography) showed slowing over right hemisphere. MRI and EEG were in supporting document. In conclusion a very curious presentation of bilateral papillitis followed by a meningoencephalitis, which was not typical of MS (multiple sclerosis) or Devic's Neuromyelitis Optica. Working diagnosis was "steroid-sensitive acute disseminated encephalomyelitis (ADEM)". The patient was treated with IV methylprednisolone and then reducing course of oral steroids for her papillitis. Other symptoms were treated with further IV steroids and reducing course of oral steroids. The patient's acute disseminated encephalomyelitis persisted. The agency considered that acute disseminated encephalomyelitis was possibly related to therapy with GARDASIL. The original reporting source was not reported. No further information is available.

Other Meds: Unknown

Lab Data: diagnostic laboratory test, CSF polymorphs 37%; magnetic resonance imaging, signal change in right middle cerebellar peduncle and change of right hemisphere meningitis; electroencephalography, slowing over right hemisphere; CSF lymphocyte c

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Balance disorder, Dysarthria, Fatigue, Gait disturbance, Headache, Insomnia, Tremor

Symptom Text: Information was obtained on a request by the Company from the agency via a Public Case Detail concerning a 16 year old female who on 24-OCT-2006 was vaccinated with GARDASIL (lot# 660614/0241X, batch # K2852). On 15-DEC-2008 the patient experienced tremor, balance disorder, dysarthria, fatigue, gait disturbance, headache and insomnia. It was reported that the patient experienced hand tremor, loss of balance, slurred speech, tiredness, headache, difficulty sleeping, not walking (short distances with a stick) and not attending school. The events required a specialist consultation - the patient saw a neurologist and was treated with ENDEP, INDERAL and EPILIM. Investigations were ongoing and inconclusive (demyelinating disease, migraine associated dysfunction). The patient has ceased medication as they made her too tired and unsteady. Laboratory evaluations revealed that: on 22-JAN-2009, antinuclear factors did not detect ANA (antinuclear antibodies). On 02-FEB-2009, magnetic resonance imaging showed apparent increased T2 signal in mid-medullary region anterolaterally on the right; radiologist concluded almost certainly artifact; otherwise normal intracranial appearance. On 02-FEB-2009, the patient had normal copper levels, ceruloplasmin, Vitamin E and celiac serology. The patient's symptoms persisted. The agency considered that tremor, balance disorder, dysarthria, fatigue, gait disturbance, headache and insomnia were disabling and possibly related to therapy with GARDASIL. The original reporting source was not provided. No further information is available.

Other Meds: Unknown

Lab Data: magnetic resonance imaging, 02Feb09, apparent increased T2 signal in mid-medullary region anterolaterally on the right; magnetic resonance imaging, 02Feb09, radiologist concluded almost certainly artefact. Otherwise normal intracranial appe

MedDRA PT Dizziness, Nausea, Nystagmus

Symptom Text: Information was obtained on a request by the Company from the agency via a Public Case Detail concerning a 25 year old female who on 09-APR-2009 was vaccinated with GARDASIL (lot# 1208U, batch# NH30330). Other suspect therapy included VAXIGRIP (lot# DE173). On 09-APR-2009 the patient experienced nausea, dizziness and nystagmus and was hospitalized. It was reported that one hour after vaccination, the patient felt faint and nauseated. Nystagmus developed soon after. The patient was treated with STEMETIL, ondansetron and IV fluids. Subsequently, the patient recovered from nausea, dizziness and nystagmus. The agency considered that nausea, dizziness and nystagmus were possibly related to therapy with GARDASIL and VAXIGRIP. The original reporting source was not provided. No further information is available.

Seriousness: ER VISIT, HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Arthralgia, Balance disorder, Cerebral haemorrhage, Computerised tomogram abnormal, Dizziness, Fall, Gait disturbance, Haematemesis, Haemorrhage intracranial, Head injury, Headache, Loss of consciousness, Musculoskeletal pain, Pain in extremity, Skull fractured base, Subarachnoid haemorrhage, Syncope, Vomiting

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 16 year old female with left knee discomfort and left knee chondromalacia patellae on 26-AUG-2009 was vaccinated with the first dose of GARDASIL IM into the left arm (therapy dose unknown) (Lot # 662229/1497X). Concomitant therapy included the first dose of HAVRIX IM into the left arm (therapy dose unknown) (Lot # AHAVB296BA) and DTaP (unspecified) (therapy dose, site and route unknown) (manufacturer unknown). The patient sat in clinic room 10-15 minutes after administration those vaccine. The patient stated felt fine, color good and was released to check out. The patient stood 1-2 minutes and fell, possibly fainting and hitting head. The patient presented to the emergency room vomiting copious amount and with moderate amounts of bright red blood. CT revealed a subarachnoid hemorrhage and occipital skull fracture. The patient was observed overnight at the hospital and had now acute events. The patient's symptoms had now resolved except some musculoskeletal pain. On 22-SEP-2009 emergency department and medical records were received concerning the patient's status of 20-APR-2009 to 03-SEP-2009. Assessment showed skull fracture and intracranial hemorrhage secondary to vasovagal syncope. WBC 14.8 3/Ul (H), RBC 4.05 6/Ul (L), Hematocrit 34.1% (L), Seg Neut 91.5% (H) Lymph 4.6% (L), Seg Neut ABS 13.5 (H), Lymph ABS 0.7 (L). The patient presented with headache and vomiting after syncope and a fall. The patient felt light headed and lost consciousness, struck back of head on ground, occipital skull fracture, anterior intraparenchymal bleed and small subdural hemorrhage, occipital fracture, hematemeisis, pain left buttock and posterior left leg, off balance gait. Upon internal review, haemorrhage intracranial was considered to be an other important medical event. The original reporting source was not provided. The VAERS ID # is 356281. A standard lot check investigation had been finalized.

Other Meds:

Lab Data: head computed axial, subdural hemorrhage, occipital skull fracture; diagnostic laboratory, Seg Neut ABS 13.5 (H); diagnostic laboratory, Seg Lymph ABS 0.7 (L); WBC count, 14.8 3/uL (H); red blood cell count, 4.05 6/uL (L); hematocrit, 34.1%

MedDRA PT Amnesia, Confusional state, Convulsion, Dyskinesia, Fatigue, Gaze palsy, Musculoskeletal stiffness, Staring

Symptom Text: Information has been received from a physician and an office manager concerning a 12 year old female patient with amoxicillin allergy (AMOXILIN) who on 26-AUG-2009 was vaccinated with the first 0.5 ml of a dose of GARDASIL, concomitantly with a dose of BOOSTRIX (Lot: AC528046AA), a dose of VARIVAX (Lot: 664232/0498Y) and a dose of MENACTRA (Lot: U2815AA). The patient stated that after the vaccinations she felt tired. She went home and had a seizure. The patient went to Emergency room and had computed axial tomography (CAT) done (results not reported). The patient was not hospitalized. The patient's mother called on 27-AUG-2009 at the Physician's office and stated that her daughter was doing better. The physician also stated that he did not consider the events to be Life threatening or to have caused the patient significant Disability or Incapacity. Upon internal review seizure was considered as other important medical event. Additional information has been requested. 9/21/09 ER records received for DOS 8/26/09 with dx: possible seizure by hx with normal exam in ER. Pt presented after episode of staring, becoming stiff, shaking and jerking, eyes rolling back in head and lack of memory of event. Confused after.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Blood product transfusion, Inappropriate schedule of drug administration, Lymphopenia, Thrombocytopenia, Vaccine positive rechallenge

Symptom Text: Case of misuse received from a Health Authority (HA reference number BX20090477 and BX0900533). This case is linked to serious case WAES 0908USA01100 (same vaccine, same patient, different events). A 15 year old female with a history of HIV positive since her birth (mother to child contamination) had received the first dose of GARDASIL (batch number, lot number and route not reported) in April 2008 and a dose of PNEUMOVAX (batch number, lot number and route not reported) in April 2008. After vaccination, her viral load was very slightly positive at 68 copies, but she experienced a marked decrease of CD4 T cells on a background of lymphopenia at a 0.797 (G/L (see linked case). She received the second dose of GARDASIL (batch number , lot number and route not reported) in May 2009, after CD4 lymphocytes had increased (>0.700 G/L). Consequently, it was an inappropriate schedule of vaccination as she received the second dose on May 2009, i.e. more that one year. One month after the second dose, she developed thrombocytopenia and decreased CD4 Cells. She was hospitalized during one night to received intravenous injection of immunoglobulins. The patient was found to have platelet count at 6 on 24-JUN-2009, at 9 25-JUN-2009, at 97 on 03-JUL-2009 (normal range: 140-450 g/L). As reported, in April 2006, her CD4 T cells (normal range: 0.7-1.1 G/L) were at 0.199. On 24-JUN-2009, her CD4 T cells were at 0.478 and her viral load at 2964 copies/mL. To be noted that the HA coded second dose of GARDASIL as suspect, thrombocytopenia and lymphocytes CD4 decreased as adverse events, and positive rechallenge. The imputability was assessed as doubtful (C2S1) by the HA. The Health Authority specified that the imputability "doubtful" (C2S1) was assessed for thrombocytopenia. At the time of reporting, the patient had not recovered. Other business partner number included: E2009-08236. Additional information has been requested.

Other Meds: Unknown

Lab Data: blood CD4 count, ??Apr06, 0.199 G/L; blood CD4 count, ??Apr08, 0.797 G/L; plasma HIV RNA quantification, ??Apr08, 68 copies/mL; blood CD4 count, ??May09, >0.700 G/L; blood CD4 count, 24Jun09, 0.478 G/L; plasma HIV RNA quantification, 24Jun0

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Autoimmune thyroiditis

Symptom Text: Information has been received on 26-AUG-2009 from a pediatrician concerning a 17 year old female patient with no medical history reported who on 11-SEP-2008 was vaccinated intramuscularly with the first dose of GARDASIL (batch# NH15190, lot# 1114U) into the left upper arm. On 24-MAR-2009 the patient was vaccinated intramuscularly with the second dose of GARDASIL (batch# NH10940, lot# 1114U) into the left upper arm. In April 2009, the patient experienced hashimoto's-thyroiditis (not specified) and in July 2009 the diagnosis was established. Laboratory values showed increased thyroid hormones and antibodies. fT3 (free triiodothyronine) was 26.8pmol/L; fT4 (free thyroxine) was 40.2/pmol/L; Thyreoperoxidase-Antibodies (anti-TPO) was 231 U/ml. At the time of this report the patient just suffered from hyperthyroitic situation. The physician prognosed a life-long need for medication and therefore a remaining damage. He assessed the relation between the vaccinations and the adverse event as possible. File is closed. Hashimoto's-thyroiditis was considered to be an other medically important condition. Other business partner numbers included: E2009-08219. No further information is available.

Other Meds: Unknown

Lab Data: free serum thyroxine, 40.2 pmol/L; serum antithyroid peroxidase antibody, 231 U/ml; free serum triiodothyronine test, 26.8 pmol/L

MedDRA PT Cachexia, Decreased appetite, Dysphagia, Oesophageal disorder

Symptom Text: Information has been received from a general practitioner concerning a 16 year old female patient who in August or September 2007, was vaccinated with the first dose of GARDASIL (lot number, injection site and route not reported). On an unspecified date shortly prior to vaccination, the patient had also received meningococcal vaccine (unspecified) (manufacturer unknown). Shortly after the vaccination, the patient experienced dysphagia (difficulties swallowing), followed by anorexia and cachexia. She was admitted to hospital in a medical department, but also in a psychosomatic department. All exams were without pathological findings, only a "slight oesophageal tonus disorder" was diagnosed. No written hospital reports were provided yet. The reporter stated that the patient was recovered from the events (weight 43 kg, height 163 cm). In contact to the parents of the patient, the family doctor does not consider the events as side effects of the vaccines. Nevertheless, he contacted the company to inquire whether there are similar cases reported. Other business partner numbers include E2009-08151.

MedDRA PT Asthenia, Circulatory collapse, Dizziness, Dyspnoea, Fatigue, Immediate post-injection reaction, Lethargy, Loss of consciousness, Malaise, Myalgia, Nausea, Pallor, Shock, Syncope

Symptom Text: Information was obtained on a request by the Company from the agency via a Public Case Detail concerning a 21 year old female who on 27-MAY-2009 was vaccinated with a dose of GARDASIL intramuscularly (site not reported). Concomitant therapy included DIANE 35 ED and ZOLOFT. On 27-MAY-2009 the patient felt dizzy immediately after injection with symptoms of fainting and unaware of events as they lay her on the floor in the Doctor's surgery. The patient was unconscious for 25 minutes. Almost cardiac arrest. Nausea, shock, dizziness, shortness of breath, pallor, tiredness, lethargy and weakness, aching neck muscles for 48 hours after. Paramedics in attendance for transportation to hospital, she was given oxygen, MAXOLON and PANADOL. Circulatory collapse, asthenia, dizziness, dyspnoea, fatigue, lethargy, malaise, myalgia, nausea and pallor were considered to be immediately life-threatening. The original reporting source was not provided. No further information is available.

MedDRA PT Intracranial pressure increased, Optic nerve injury, Vision blurred

Symptom Text: Information has been received from a physician concerning an 18 year old female who on approximately 31-JUL-2009 was vaccinated with the first dose of GARDASIL. Concomitant therapy included hepatitis B virus vaccine (unspecified), which was vaccinated with GARDASIL (first dose) on the same day. On 21-AUG-2009 (3 weeks after vaccination) the patient was hospitalized due to the blurred vision. After examinations, the patient was diagnosed with the intracranial hypertension and injury of optic nerve due to intracranial hypertension. The blurred vision was the symptom of injury of optic nerve. However if the patient was diagnosed with optic neuritis or not was not determined yet. The patient was treated with unspecified medication which had the lowering effect of the brain pressure, and was followed up for finding the cause. The patient had no medical history, concurrent disease and concomitant medication except hepatitis B virus vaccine. The patient's intracranial hypertension and injury of optic nerve persisted. The reporting physician reported that the causal relationship with GARDASIL was unknown so far. Additional information has been requested.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Case of pregnancy follow up reported by a physician GARDASIL pregnancy registry on 23-JUN-2009. A 17 year old female patient received the third dose of GARDASIL (Batch # not reported) on 15-JUN-2009. She had just started a spontaneous pregnancy. There was no personal or familial medical history. The patient would probably carry on the pregnancy. No reaction was reported. Follow up information received through a letter form the gynecologist on 28-AUG-2009. The case was upgraded to serious based upon the following information: The patient experienced a spontaneous abortion approximately in the middle of August 2009. Other business partner numbers include E2009-05249. No further information expected.

MedDRA PT Contusion, Convulsion, Fall, Headache, Nausea, Syncope

Symptom Text: Information has been received from a physician and the medical assistant concerning a 19 year old female with no known drug allergies who "two weeks ago" on 07-AUG-2009 was vaccinated with her first dose of GARDASIL 0.5 mL, intramuscularly, Lot# 0162Y. Concomitant therapy included ADACEL Lot# UF471AA and MENACTRA U2846AA. On 07-AUG-2009, five minutes after the patient received the vaccinations, she stood up to walk to the waiting room. The patient fell to the floor, face down. The patient had syncope and seizure like activity for 5 minutes. The ambulance was called. The patient regained consciousness and was observed in the office. The patient did not go to the hospital at that time. The patient went home accompanied by her mother and aunt. On 08-AUG-2009, the patient went to the Emergency Room and complained of headache and nausea. The patient had a CT scan with normal results. The patient had bruises of the right elbow and right hip. The patient was not admitted to the hospital. The patient had recovered. The patient had a follow-up visit with the physician on 14-AUG-2009. Syncope and seizure like activity were considered to be disabling. This is one of several reports from the same source. Additional information has been requested.

MedDRA PT Chest discomfort, Dyspnoea, Flushing, Hypersensitivity, Inappropriate schedule of drug administration, Pruritus, Tremor

Symptom Text: Information was obtained on a request by the Company from the agency via a Public Case Detail concerning a 28 year old female who on 30-MAR-2009 was vaccinated with a 120 mcg dose of GARDASIL intramuscularly. Concomitant therapy included CARDIPRIN, EPILIM, MOTILIUM, NEXIUM, NORVASC and "Notan". On 30-MAR-2009 the patient experienced hypersensitivity, chest discomfort, dyspnoea, flushing, pruritus and tremor and was hospitalized. The reaction occurred within 5 minutes of GARDASIL administration. The patient was treated with ranitidine 50 mg IV, atenolol 25 mg, dexamethasone (manufacturer unknown) 4 mg IV, promethazine and aspirin 100 mg. At the time of the report, the patient had recovered. The agency felt that hypersensitivity, chest discomfort, dyspnoea, flushing, pruritus and tremor were probably related to vaccination with GARDASIL. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Multiple sclerosis

Symptom Text: Information has been received from an internist concerning a 17 year old female who on 08-FEB-2008 was vaccinated with a first dose of GARDASIL (lot# 1539F; batch# NF42170) IM, into her upper arm and a second dose of GARDASIL (lot# 1172U; batch# NH13130) IM, into the upper arm on 12-AUG-2008. On 23-AUG-2008 the patient experienced a first attack of encephalomyelitis disseminata (multiple sclerosis). Initially suspicion of parainfectious encephalomyelitis was established. But the diagnosis of multiple sclerosis was supported by a second attack on 21-JUL-2009. The reporter stated a "persisting damage" and assessed the relation between the adverse event and the vaccines as possible. Multiple sclerosis was considered an other important medical event. Other business partner numbers include: E2009-08249. No further information is available.

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Adnexa uteri pain, Condition aggravated, Dizziness, Injection site pain, Injection site swelling, Nausea, Ovarian cyst ruptured, Pain, Vaccine positive rechallenge

Symptom Text: Information has been received from an approximately 25 year old female patient with "cysts in the ovaries that were not a problem", papilloma viral infection and an allergy to benzyl peroxide and a history of caesarean section (2002) who in 2008 was vaccinated with GARDASIL. The consumer already had HPV prior to vaccination with GARDASIL. Concomitant therapy included DEPO-PROVERA. The patient reported that she experienced dizziness after each dose of GARDASIL. All 3 doses were given over a 6 month period. The physician assistant recommended GARDASIL because "it would be helpful for her current HPV infection". The dizziness lasted for a couple of weeks after each vaccination. There was swelling at the site of injection after each dose and the site was pretty painful for 2 or 3 days. There was an occasional nausea within 1 week after each dose which seemed to coincide with the dizziness. The dizziness seemed to cause the nausea. The patient also had increased pain with cysts in the ovaries that had gotten worse since she received all 3 doses. ON approximately 28-JUL-2009 one of the cysts that was 2 inches in size ruptured and the patient was hospitalized. The patient still has day to day pain from the cysts. The patient did not have dizziness or nausea that stopped a few weeks after the 3rd dose of GARDASIL. At the time of the report the patient was not recovered from the other adverse events. The patient sought medical attention at office visit. On an unknown date a blood test was performed and it was normal, also a biopsy of cervix prior to vaccinations was performed (results not provided). Additional information has been requested. 9/14/09 PCP medical records received DOS 9/7/07 to 10/18/07. Patient complains of ovarian pain and cyst.

Other Meds: DEPO-PROVERA

Lab Data: diagnostic laboratory, Blood test Normal. 9/14/09 PCP medical records received DOS 9/7/07 to 10/18/07. LABS and DIAGNOSTICS: Urinalysis - Leukocytes trace, (+) nitrite, protein trace. TSH. CBC. CMP.

History: Caesarean section. 9/14/09 PCP medical records received DOS 9/7/07 to 10/18/07. DepoProvera. PAP mild dysplasia.

Prex Illness: Ovarian cyst; Papilloma viral infection; Hypersensitivity. 9/14/09 PCP medical records received DOS 9/7/07 to 10/18/07. Colposco

MedDRA PT Lymphoma

Symptom Text: Information has been received from a health care professional concerning a 19 year old female patient who on an unspecified date was vaccinated with the second dose of GARDASIL. It was reported that after the second dose of GARDASIL she developed lymphoma. It was reported that the parents were trying to associate it with GARDASIL. The patient was no longer a patient with this practice due to her age. It was reported that she was going to an Obstetrician/Gynecologist practice. The outcome of the patient was not reported. Upon internal review lymphoma was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Arthralgia, Blood test abnormal, Disability, Hypersensitivity, Impaired work ability, Mechanical urticaria, Serum sickness, White blood cell count increased

Symptom Text: This case was received from a health care professional, via another manufacturer (reference number WAES 0906USA00846), on 25 August 2009. "Initial and follow-up information has been received from a nurse practitioner concerning her daughter, a 18 year old female student who on 06-MAR-2009 was vaccinated with her first dose of GARDASIL, 0.5 ml, intramuscularly into her right deltoid (LOT# 661703/0651X) at 10:40 am." "On 03-MAR-2009, the patient was vaccinated with her third dose of VARIVAX (Lot: 659845/0270X) intramuscularly into her right deltoid at 15:00 pm and with her first dose of MENACTRA (lot # U2669AA) intramuscularly into her left deltoid at 15:00 pm. Concomitant therapy included an unspecified birth control pill." "Subsequently the patient had an " allergic reaction, where you could write on her skin with a pen and still see it 3 hours later". However it was not specified if she meant that she could still saw ink on her skin 3 hours later or if she could still saw indentation on her skin 3 hours later. The reporter's daughter also experienced joint pain. The nurse practitioner said that her daughter's allergist thought that it was an allergic reaction to MENACTRA (manufacturer unspecified). At the time of reporting the patient's present status was unknown." "Additional information has been received from the medical assistant and provided the following additional details." "The patient has a past medical history of acne, no known drug allergies." "The exact AE onset date is unknown, but the chart notes show an ER visit on approximately 22-MAR-2009. The patient went into the office on 23-MAR-2009 for blood work (values mostly within normal limits; WBC slightly elevated. The patient was treated with a MEDROL dose pack and Benadryl. The medical assistant couldn't say if the events were disabling or life threatening. The patient's status was unknown." "The health care professional contacted during telephone follow up could not supply the following information: date of event and recovery status." "Additional i

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Dizziness, Hyperhidrosis, Pallor, Skin discolouration

Symptom Text: Patient claims that she felt lightheaded after standing for 10 mins and she had to be assisted with walking. She also claims that after feeling lightheaded and dizzy she sat down on cold floor at which point "everything was black" for approximately 10-20 mins. Patient never lost consciousness. People with patient noted that she was pale and lips greenish and was sweating profusely.

MedDRA PT Cold sweat, Convulsion, Dizziness, Erythema, Hyperhidrosis, Immediate post-injection reaction, Injection site erythema, Injection site inflammation, Injection site swelling, Malaise, Nausea, Oedema peripheral, Pallor, Pyrexia, Steroid therapy, Syncope, Tremor, Unresponsive to stimuli

Symptom Text: Information has been received from a pharmacist concerning his 19 year daughter who on 28-AUG-2009 was vaccinated with a dose of GARDASIL, 0.5 mL, I.M. and a dose of PNEUMOVAX concomitantly in the same arm. Subsequently, the patient fainted instantly after getting GARDASIL. She regained consciousness and was shaking. She brought to the ER of an unspecified hospital but was not admitted. She seemed to be alright. On an unspecified date, the patient recovered from the AE. The pharmacist also said that, at the time of the report, the patient has "significant swelling" at the site where she was administered PNEUMOVAX. The patient sought unspecified medical attention. Follow-up information was received from the pharmacist via medical records indicating that his daughter was a 19 year old college student with no pre-existing allergies, birth defects or medical conditions (also reported as having asthma). On 28-AUG-2009, at 17:40 (also reported as 17:45), the patient received a first dose of GARDASIL (Lot #659054/0311Y) IM in the left deltoid. On the same day, prior to the GARDASIL injection, the patient received a first dose of PNEUMOVAX (Lot # 661741/0870X) SQ in the left triceps. There was no illness at time of vaccination. Other concomitant therapy included ALLEGRA, DUAC and DIFFERIN. It was reported that the patient immediately became lightheaded, pale and then fainted upon delivery of the GARDASIL almost as soon as the needle was removed (also reported as 17:45). Patient was unresponsive for less than 1 minute. As she was regaining consciousness, she was exhibiting convulsive shaking behavior which prompted the 911 call and an emergency room visit. She was also nauseated, clammy and sweaty. She presented no adverse symptoms at the time when she was vaccinated with PNEUMOVAX. However, on 30-AUG-2009 (also reported at 29-AUG-2009), her arm became very reddened and swollen, accompanied by a high fever which then persisted for 3 days preventing her from leaving for college as planned on 30-AUG-2009. The reaction was d

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Caesarean section, Drug exposure during pregnancy, Missed labour, Nausea, Urinary tract infection, Vomiting

Symptom Text: Information has been received from a 21 year old female with vulvovaginitis and pyelonephritis (last urinalysis positive in Oct-2008) with a history of papilloma viral infection, loop electrosurgical excision procedure and cervical conisation who in FEB-2008, was vaccinated with GARDASIL first dose, in APR-2008, was vaccinated with GARDASIL second dose and the last dose was received on 16-SEP-2008. Concomitant therapy included GYNOCLINV. The last menstrual period was on 20-AUG-2008. The patient referred that she unknown that was pregnant at the time of the last vaccine. On 29-SEP-2008 blood pregnancy test reported as positive. In Oct-2008 urinalysis was positive for infection. The patient's pregnancy continued with good evolution. Follow up: new information was received. In January 2009, the patient experienced vomiting and nausea and it was necessary to receive rehydration (route not reported) at the doctor's office. The reporter confirmed that hospitalization was not required. The patient recovered from nausea and vomiting in January 2009 and felt that vomiting and nausea were not related to therapy with GARDASIL she stated that her physician considered nausea and vomiting were related with the pregnancy. On 26-AUG-2009 pregnancy outcome information was received from the patient who referred that on 13-MAY-2009 at 38 weeks of pregnancy a cesarean section was performed due missed labor, she delivered a live male infant in healthy conditions and weighing 2.825 kilograms, Apgar is unknown. The patient and her son were discharged on 16-MAY-2009 both without complications. The patient recovered from nausea and vomiting (date unknown). No further information is available.

MedDRA PT Asthenia, Dry mouth, Erythema, Eyelid oedema, Flushing, Headache, Lip dry, Lip swelling, Malaise, Mobility decreased, Muscle spasms, Muscular weakness, Ocular hyperaemia, Oedema mouth, Pain, Paraesthesia, Pollakiuria

Symptom Text: Information was obtained on a request by the Company from the agency via a Public Case Detail concerning a 12 year old female patient who on 11-MAY-2009 was vaccinated with a dose of GARDASIL (Lot # 661702/0506X, Batch # K6310). On 11-MAY-2009 the patient experienced headache, asthenia, dry mouth, erythema, eyelid oedema, lip dry, lip swelling, muscle spasms, ocular hyperaemia and paraesthesia and was hospitalized. Approximately one hour after vaccination, the patient developed headache, facial flushing, paraesthesia over whole body, weakness in her left leg, shooting pains from heal up her legs. The next day the patient was unwell and developed severe cramping in the thigh. The patient was taken to ED, the patient was unable to move and was in pain, the patient was able to stagger. Later, the patient developed puffy eyelids, red eyes, swollen and dry lips/mouth. The patient seemed to be urinating excessively. Prior to vaccination, the patient had a suspected viral illness but had recovered prior to vaccination. At the time of the report, the patient was still recovering but had not yet recovered. The patient was sore and had still legs, patient was able to walk unassisted and was experiencing pins and needles in feet and occasionally in the hands. The doctors stated that there were signs of questionable rheumatoid arthritis. The patient's father had nephrotic syndrome at 11 years old of age. The agency felt that headache, asthenia, dry mouth, erythema, eyelid oedema, lip dry, lip swelling, muscle spasms, ocular hyperaemia and paraesthesia were possibly related to vaccination with GARDASIL. The original reporting source was not provided. Additional information is not expected.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Anxiety, Chest discomfort, Dyspnoea, Headache, Inappropriate schedule of drug administration, Insomnia, Loss of consciousness, Panic attack, Syncope, Tremor

Symptom Text: Information was obtained on request by the company from the agency via a public case detail concerning an 18 year old female patient who on 28-MAY-2009 was vaccinated with the second dose of GARDASIL. This was one month after first vaccination (did not know why there was an interval of only one month between instead of two months). On 28-MAY-2009 the patient experienced syncope, anxiety, chest discomfort, dyspnoea, headache, insomnia and panic attack. Ten minutes after injection the patient fainted, developed headache and continued to black out over next few days. Two weeks ago (about mid-June), the symptoms worsened, headache increased. The patient had trouble breathing and experienced panic attacks. The patient developed uncontrollable shaking of arms and was hospitalized. Valproate was prescribed but ceased after 2 days. Magnetic resonance imaging indicated no abnormalities, an electroencephalography showed an already dysrhythmia (possibly due to febrile convulsions as a toddler). The patient was discharged from hospital with recommendation for psychiatric assessment which, at this stage, had not been acted upon. The patient continued to experience a feeling of pressure on chest, difficulty breathing, anxiety and insomnia. The agency considered that syncope, anxiety, chest discomfort, dyspnoea, headache, insomnia and panic attack were possibly related to vaccination with GARDASIL. The original reporting source was not provided. Additional information is not expected.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Activities of daily living impaired, Body tinea, Dyskinesia, Fatigue, Headache, Insomnia, Migraine, Myalgia, Pain in extremity, Paraesthesia, Pharyngitis, Pharyngitis streptococcal, Tremor, Upper respiratory tract infection, Vision blurred, Vomiting, Weight decreased

Symptom Text: Gardasil #1, Hep A #1, Menactra and flu given 10/5/07. Patient seen 5/12/08 and reported vomiting several times a week since thanksgiving (about 6-7 weeks after vaccine), limb pain, parasthesia's, headaches and fatigue. Patient still nearly 2 years later with vomiting several times a week, leg pain and tremors in her right hand/arm bad enough to interfere with school work and writing. She has had extensive GI and neuro evaluation with no diagnosis and no satisfactory treatment of symptoms. We do not know if this is related to gardasil but have begun to question it. She had a second gardasil 7/21/08. Of note, this patient has a sister with a severe mitochondrial disorder affecting her gut function, seizures, deteriorating mental function. 9/14/09 MR received from pcp which include multi-specialty consults dated from 10/2007 to 9/2009. In for WCC 10/5/07 with dx: Well. 4 vax given. Multiple visits after for pharyngitis, URI, tinea corporis, vomiting x 6 months with 8 lb weight loss, H/A, blurry vision, lower limb pain, decreased sleep, strep throat. Dx: Migraine/vomiting weight loss. Referred for labs and consults. By 9/3/09 reporting continued vomiting, tremors, muscle pain. GI consult with no specific dx made. 6/16/09 reports worsening of sx. PE (+) for fine tremor of tongue and hands. Neuro consult 6/29/09 with impression: Migraine complex. Returned for w/u for possible seizures due to episodes or tremors and jerking of the R side.

Other Meds: micronor at time of vaccination. Now on lo ovral, ponstel, zofran, carafate, lactaid, prilosec, amitryptyline

MedDRA PT Abdominal pain lower, Chest pain, Constipation, Cough, Crying, Headache, Nausea, Pain, Screaming, Tremor, Vaccination complication

Symptom Text: After recieving the Gardasil vaccine, about 3-4 ours later she had severe abdominal pain that did not stop. I gave her motrin but it didnt help. After she begain to yell, I drove her to hosp. The ER Docs refused to think Gardasil had anything to do with her pain because they claim to have never heard of such an event happening with a patient before. I happen to disagree with them. 9/28/09 ER records received DOS 8/4/09 to 8/5/09. Assessment: Chest pain, abdominal pain, allergic reaction to Gardasil. Patient c/o stabbing pain in middle of chest. Hurts with movement. Cough. Stabbing abdominal pain. Headache, nausea, "shakes", crying. Abdominal gas and distention as etiology for pain. Chest pain now resolved. Patient in no distress. 9/28/09 Received ICD9 codes: 786.59; 789.00; V14.0./ss

Other Meds: none

Lab Data: They diagnosed her with constipation & pain in lower abdomen. This is not a correct diagnosis, my daughter was not constipated. She did eat any thing after 12 pm. 9/28/09 ER records received DOS 8/4/09 to 8/5/09. LABS and DIAGNOSTICS: EKG

History: none. 9/28/09 ER records received DOS 8/4/09 to 8/5/09. Penicillin Allergy.

Prex Illness: none- she went in for annual school check-up

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Arthralgia, Rheumatoid arthritis

Symptom Text: My daughter was adminstered GARDASIL (I cannot find it in your list of vaccines below/ Ch.-B.: NE51780, NE51790, NF56940) on May 5, 2007, July 10, 2007, and January 14, 2008. A few months later (middle of 2008) she began to complain about joint pains that have now been diagnosed officially as rheumatoid arthritis. She has never been exposed to cigarette smoking, no alcohol or drug abuse or any other behavior that might have triggered the disease. Her maternal grandmother was diagnosed with it in her mid-40's, but she used to be a heavy smoker, and only has a light bought. Again, I cannot think of any other external trigger that might have been responsible for the illness other than the questionable Gardasil immunization, because it is closely related in time: shortly after the immunization the arthritis broke out.

Other Meds: None at the time

Lab Data: The RA diagnosis has been established (after examination and blood tests) on July 22, 2009 by Dr. at the Hospital

History: Hashimoto (Thyroid)

MedDRA PT Caesarean section, Drug exposure during pregnancy, Labour complication

Symptom Text: Information has been received from an 18 year old healthy female who on 13-OCT-2008 was vaccinated with the first dose of GARDASIL (Lot # 660393/0067X) and was about 4 weeks pregnant at the time (LMP approximately 15-SEP-2008). Estimated delivery date: 22-Jun-2009. No adverse event reported. The patient did not seek medical attention. Follow-up information was received from the registered nurse indicating that the outcome pregnancy questionnaire was forwarded to the OB/GYN who is currently seeing the patient. Follow up information was received from the registered nurse for the pregnancy registry for GARDASIL who reported that on 10-JUN-2009, the patient gave birth to a normal male infant weighing 6 pounds and 6 ounces, length 19 and head circumference 12 3/4. There were no other complications or abnormalities. It was reported that during pregnancy there were no complications. Other medication used during pregnancy included prenatal vitamins (everyday). No diagnostic tests were performed during pregnancy. During labor/delivery, the patient did not dilate and required a c-section. Upon internal review, did not dilate and required a c-section was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Abdominal pain, Arrested labour, Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a gynecologist that concerning an 18 year old female who on 16-OCT-2008 was vaccinated with GARDASIL (lot number 0251U; batch number NF43780) toleration was not reported). The patient was vaccinated while pregnant (gestation week not reported) with a second dose of GARDASIL (lot number 1477U; batch number NH25390) route, injection site not reported; on 10-NOV-2008 in approximately 4th week of pregnancy. On 23-NOV-2008 sonography revealed pregnancy (gestation week 8 to 9). Prior the patient was presented to an internist due to abdominal pain which was diagnosed as pregnancy. The patient's menstrual cycle had been irregular therefore the date of the last menstrual period (LMP) was unknown. The calculated end of pregnancy would be approximately 30-JUN-2009. At the time of reporting the pregnancy was without pathologies and the patient had not experienced many adverse effects. Follow up information has been received on 31-AUG-2008. Due to cesarean section the case had to be upgraded to serious. It was reported that the course of pregnancy was normal. The delivery was by cesarean section to arrested labor during stage of expulsion on 09-JUL-2009. The prenatal examination of mother and child showed no pathologies. Other business partners included are: E2008-10928. The reporter felt that the Arrested labour was an important medical event. Additional information is not expected.

MedDRA PT Abdominal pain, Activities of daily living impaired, Arthralgia, Bedridden, Chills, Condition aggravated, Fatigue, Hallucination, Headache, Hyperhidrosis, Influenza like illness, Malaise, Musculoskeletal stiffness, Oropharyngeal pain, Petechiae, Photophobia, Pyrexia, Rash, Rheumatoid arthritis, Stills disease adult onset, Vomiting, Weight decreased

Symptom Text: Information has been received on request by the company from the agency via public case details form concerning a 16 year old female patient who on 11-MAY-2007 was vaccinated with the first dose of GARDASIL (Lot number 655742/0138U and Batch number J0799) intramuscular, on 12-JUN-2007 with the second dose of GARDASIL and on 29-OCT-2007 with the third dose of GARDASIL (Lot number not reported). On 26-NOV-2007 the patient experienced rheumatoid arthritis and still's disease adult onset. The first episode of illness resulted in general malaise and flu like symptoms and progressed to cyclical pattern of fevers/chills/sweats several times, during 24 hours period. This first episode of illness resolved around 09-DEC-2007 and patient recovered. The patient was taken to a medical centre during this illness. The second episode of illness was very severe and began on 22-DEC-2007 and again started with malaise and flu like symptoms progressing to a continuous cycle if fevers/chills/sweats with no break between the cycles. The patient had severe abdominal and joint pain, sore throat, headache, vomiting and was incapacitated and continually bedridden and unable to attend to ADL's such as showering and eating for two weeks. The patient also suffered from hallucinations and lost 6 kg. The patient again attended a medical centre for treatment. In January 2007, the patient was admitted to the hospital for 5 days under specialist care. The patient was then referred to another specialist (Rheumatologist) and registered and had been under their care since February 2008. A firm diagnosis had not been reached to date, however the specialist had started that it appeared to resemble adult onset still's disease. It was unsure if the following information was relevant, but the patient the patient suffered a mild fever after the first dose of GARDASIL in May 2007. The patient also suffered an illness in mid July 2007. The symptoms of the illness involved high fever, severe headache, neck stiffness, extreme aversion to light, vomiting and p

MedDRA PT Arthralgia, Headache, Lymphadenopathy, Muscular weakness, Paraesthesia

Symptom Text: Information was obtained on request by the company from the agency via a Case Line Listing through CSL NZ as part of a business agreement (Manufacturer control number: 084849), concerning a 16 year old female patient who on 27-APR-2009 was vaccinated with 0.5 ml of a dose of GARDASIL intramuscularly. On 27-APR-2009 the patient experienced paraesthesia (severe), lymphadenopathy (severe), arthralgia (severe), headache (severe) and muscle weakness (severe). At the time of reporting in June 2009, the patient's paraesthesia, lymphadenopathy, arthralgia, headache and muscle weakness persisted. The agency considered that paraesthesia (severe), lymphadenopathy (severe), arthralgia (severe), headache (severe) and muscle weakness (severe) were "possible" related to therapy with GARDASIL. Paraesthesia (severe), lymphadenopathy (severe), arthralgia (severe), headache (severe) and muscle weakness (severe) were resulted in persisting disability. The original reporting source was not provided. Additional information is not expected.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Convulsion

Symptom Text: Information has been received from a nurse in the physician's office concerning a female patient who on 14-JUL-2009 was vaccinated with the second dose of GARDASIL (lot# 661531/1311X). On 31-AUG-2009 the patient "experienced a seizure approximately 6 weeks after receiving her second dose of GARDASIL. She went to the emergency room but it was unknown if she was admitted to the hospital. " The result of computed axial tomography was normal. The outcome was unknown. Follow up information was received from a Certified Medical Assistant (C.M.A.) on 01-SEP-2009 via telephone stated that the 10 year old patient received the first dose of GARDASIL on 04-MAY-2009 (Lot number not available to reporter at that time) and second dose of on 14-JUL-2009 (lot# 661531/1311X). On 31-AUG-2009, the patient had a seizure. The patient's mother took the patient to the Emergency Room. The patient had a CT scan of the head which was normal. The patient was not admitted to the hospital. The patient was scheduled for an EEG on 03-SEP-2009. The Certified Medical Assistant did not know if the patient recovered and did not know if the patient had a significant disability. Upon internal review, seizure was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Deep vein thrombosis, Phlebitis superficial, Thrombophlebitis superficial, Thrombosis

Symptom Text: Information has been received from a 24 year old female with family history of blood clots, her grandmother and mother were factor 5, and no drug reactions/allergies who in April 2009, was vaccinated with the first dose of GARDASIL (Lot # not reported). In June 2009, the patient was vaccinated with the second dose of GARDASIL (Lot # not reported). Concomitant therapy included hormonal contraceptives (unspecified). On 06-JUL-2009, the patient was diagnosed with a blood clot and was admitted to the hospital for less than 1 day. On an unspecified date, the patient had a factor 5 test and an ultrasound performed (results not provided). In the end of July 2009, the patient recovered from blood clot. Additional information has been requested. 9/18/09 Hospital records received DOS 7/8/09 to 7/9/09. Assessment: Acute deep venous thrombosis in right leg. Soft ball injury to leg, multiple abrasions 1 week prior. Presents with exquisite right calf pain. Superficial phlebitis of right lesser sapheous, occluded calf vein, thrombosis of right gastronemius vein, occluded deep vein thrombosis of right superficial femoral and popliteal veins. ICD-9 Codes: 782.3 Edema, 451.0 Superfic Phlebitis - Leg, 916.0 Abrasion Hip & Leg, 346.90 Migrne Unsp wo Ntrc Mgrn, V18.3 HX-Blood Disord Nec.

Other Meds: hormonal contraceptives. 9/18/09 Hospital records received DOS 7/8/09 to 7/9/09. Oral contraceptives.

Lab Data: Ultrasound, ?/?/09, results not provided; Factor V activity test, ?/?/09, results not provided. 9/18/09 Hospital records received DOS 7/8/09 to 7/9/09. LABS and DIAGNOSTICS: Venous Duplex - Abnormal. CBC - WBC 12.8 K/uL (H). Heterozygous

History: Unknown. 9/18/09 Hospital records received DOS 7/8/09 to 7/9/09. Migraine headaches, generalized anxiety disorder, depression, allergic rhinitis. Alcohol use. Factor V Leiden deficiency.

MedDRA PT Abdominal pain upper, Chest discomfort, Chest pain, Metabolic syndrome, Pulmonary embolism

Symptom Text: Information has been received from a health professional concerning an 18 year old female patient who in January 2009, was vaccinated with a dose of GARDASIL (the patient was not vaccinated at the reporter's clinic). The consumer became their patient because of the pulmonary embolism diagnosed shortly after getting GARDASIL in April 2009. The patient was treated with COUMADIN for 3 months, but then she was on aspirin daily. She has been hospitalized on several occasions due to her pulmonary embolism (one reported hospitalization lasting 10 days). It was reported that there were no other risks identified for the pulmonary embolism. At the time of the report, the patient status was unknown. The reporter considered the pulmonary embolism to be immediately life-threatening. Additional information has been requested. 9/18/09 Hospital/medical records received DOS inpatient 4/16/09 to 4/17/09 and outpatient visits to 8/24/09. Assessment: Pulmonary embolism and infarction. Dysmetabolic syndrome X. Patient presents with upper abdominal pain and lower chest type symptoms. Pulmonary emboli. Chest pain. ICD-9 Codes: 415.19 Pulmonary embolism and infarction. 277.7 Dysmetabolic syndrome X.

Other Meds: Unknown

Lab Data: Unknown. 9/18/09 Hospital/medical records received DOS 4/16/09 to 8/24/09. LABS and DIAGNOSTICS: CBC - WBC 11.6 K/MM3 (H) Lymph 25.4% (L). Urinalysis - Blood 2+ (H) RBC (+) Bacteria (+) Urobilinogen 2.0 EU/DL (H). CHEM - K 3.4 MEQ/L (L) Glu

History: Unknown. 9/18/09 Hospital/medical records received DOS 4/16/09 to 8/24/09. Obesity. Insulin resistance syndrome. Diabetes mellitus. Hypothyroid.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Alopecia

Symptom Text: Information was obtained on request by the company from the agency via a Case Line Listing through CSL as part of a business agreement, concerning a 17 year old female who on 07-MAY-2009 was vaccinated with 0.5 ml of a dose of GARDASIL intramuscularly. Concomitant therapy included fluticasone and albuterol. On 27-JUL-2009 the patient experienced alopecia (not severe). At the time of the report patient's alopecia (not severe) persisted. The agency considered that alopecia was unlikely related to therapy with GARDASIL. Alopecia (not severe) was considered to be disabling. The original reporting source was not provided. Additional information is not expected.

Other Meds: albuterol; fluticasone
