MedDRA PT Death

Symptom Text: Information has been received from a Nurse at the physician's office who heard from another Nurse that a patient came in to the office to receive the third dose of GARDASIL and the friend of the patient told her not to get the third dose because she knew of another girl that received the third dose of GARDASIL and died "within the last month" (cause of death not reported). It was unknown if the patient sought medical attention. Attempts are being made to verify the existence of an identifiable patient. Additional information has been requested.

Seriousness: ER VISIT, HOSPITALIZED, LIFE THREATENING, SERIOUS

MedDRA PT Abdominal pain, Diabetes mellitus, Fatigue, Headache, Hyperglycaemia, Malaise, Mucosal dryness, Nausea, Pollakiuria, Polydipsia, Polyuria, Thirst, Weight decreased

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 14 year old female patient with a history of warts treated by dermatologist, fracture foot and varicella post vaccine who on 17-MAR-2010, was vaccinated with the third dose of GARDASIL IM into her left arm (lot # 662300/0100Y). There was no pre existing illness. On 13-APR-2010, the patient experienced new onset diabetes mellitus and hyperglycemia. Serum glucose was 506. The patient was hospitalized for 24 hours and treated with IV fluids, insulin and education. On 20-APR-2010, hospital records and transfer/discharge summary was received. Service dates was 12-APR-2010 to 14-APR-2010. The diagnosis was diabetes mellitus. The patient presented with 1-2 week history of fatigue, polyuria, polydipsia, intermittent headache, abdominal pain and nausea, 8 lb weight loss. Insulin treatment was initiated. The patient was discharged home. Primary care physician medical records were received on 19-APR-2010. Service dates was 17-MAR-2010 to 12-APR-2010. Assessment was diabetes. The patient felt more tired, very thirsty, drinking lots of water and getting up at night to void multiple times. The patient did not feel well, and had dry tacky (oral) mucous membranes. The following lab tests were performed: serum glucose was 506 which was high, whole blood glucose was 330 which was high, urine ketones was positive, urinalysis showed glucose of 2000+, ketones large, sodium was 132 which was low, chloride was 93 which was low. The patient required an emergency room visit. No further information is available. Diabetes mellitus, hyperglycemia, fatigue, polyuria, polydipsia, intermittent headache, abdominal pain, nausea, very thirsty, does not feel well, dry tacky mucous membranes and drinking lots of water and getting up at night to void multiple times were considered to be immediately life-threatening. The original reporting source was not provided. The VAERS ID# is 385346. A preliminary lot check inves

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a medical assistant for GARDASIL, a pregnancy registry product; concerning a 24 year old female with no known medical history or drug allergies, who on 09-JAN-2009 was vaccinated with a 0.5 mL first dose of GARDASIL (lot # 661046/0546X), intramuscularly. Concomitant therapy included NUVARING. On 12-JAN-2009 the patient discovered that she was pregnant. On 09-JAN-2009 the patient had an RPR, HIV and herpes 1 and 2 tests. The patient performed a home urine pregnancy that was positive, and the office performed another urine pregnancy test on 12-JAN-2009 that was positive. No adverse effects reported. The patient sought medical attention through an office visit. The reporter stated that the patient was planning to terminate the pregnancy (not due to the vaccine). Follow up information received from a home care coordinator indicated that the patient wasn't pregnant during the GARDASIL vaccination series; (the patient finished the GARDASIL series on an unspecified date). Follow up information received from the home care coordinator indicated that the patient had a termination of her pregnancy on 27-MAR-2009. The patient returned to the office for her follow up evaluation and was considered recovered without complications. Additionally she was provided contraceptions. She also mentioned that the patient returned for the second and third GARDASIL doses (dates and lot numbers not provided). Upon internal review termination of her pregnancy was determined to be an other important medical event. No further information is available.

Other Meds: NUVARING

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Congenital anomaly, Drug exposure during pregnancy, Patent ductus arteriosus, Urine human chorionic gonadotropin positive, Ventricular septal defect

Symptom Text: Information has been received from a physician for GARDASIL, a Pregnancy Registry product, concerning a baby. The baby's 19 year old mother with no pertinent medical history or drug reactions/ allergies who on 22-JAN-2009 was vaccinated IM with the first 0.5ml dose of GARDASIL (lot number reported as "0615X"). There was no concomitant medication. On 12-FEB-2009, the mother had her intrauterine device removed. Then the mother discovered that she was pregnant. On 03-MAR-2009, urine pregnancy test was performed at the office with positive result. The mother's last menstrual period was 18-JAN-2009, the estimated delivery date was 25-OCT-2009. On 26-MAR-2009, the mother was vaccinated IM with the second 0.5 ml dose of GARDASIL (661952/1129X). No adverse effect reported. The mother sought medical attention by phone visit. Follow-up information was received from the physician concerning the 19 year old mother with once previous pregnancy and full term delivery and no birth defect in previous pregnancy. Other medication in the pregnancy included prenatal vitamins. Follow-up information has been received from the physician concerning the 19 year mother who on an unspecified date was delivered the "normal infant" baby. The physician also stated that the infant experienced congenital anomaly of small ventricular septum defect and patent ductus arteriosus. The mother's experience has been captured in WAES 0904USA01160. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Arthritis, Musculoskeletal pain, Musculoskeletal stiffness, Polyarthritis

Symptom Text: Information has been received from a general practitioner concerning a 19 year old female patient with a history of eczema who on 03-MAR-2008 was vaccinated with the third dose of GARDASIL (Batch number not reported). In June 2008, the patient developed inflammatory rheumatism or polyarthritis. She had received the second dose of GARDASIL on 06-MAY-2008. The patient was hospitalized for further investigations and received corrective treatment with methotrexate. At the time of reporting she was stabilized. Additional information was received. The patient's initials and date of birth were provided. She had a history of eczema on the hands. She developed the first symptoms in June 2008. Consequently the suspect dose of GARDASIL was the second one, administered on 06-MAY-2008. She had received the first dose of GARDASIL on 03-MAR-2008. In June 2008, she was seen in rheumatological consultation and X-ray of the hand was performed. It showed an inflammatory syndrome of one finger of the right hand. The patient also presented morning stiffness. She was hospitalized 2 days in February 2009 for complete work-up. She had sedimentation rate of 7 (units not reported), CRP of 11 (units not reported); however, the patient was already on treatment at that time. X-ray found arthritis of the fifth interphalangeal joint. The rheumatologist's conclusion was asymmetrical polyarthritis, is one side more impaired than the other, affecting distal interphalangeal joints with radiological signs of inflammatory arthritis and probably corresponding to psoriatic rheumatism. The reporting physician believed that it was not psoriatic rheumatism because the patient had a history of eczema on the hands rather than a history of psoriasis. Case linked with non-serious report E2010-02323 (same reporter, same product, similar AE). Other business partner numbers include: E2010-02322. No further information is available.

MedDRA PT Muscle contractions involuntary, Oedema peripheral, Pain in extremity, Paraesthesia, Polyneuropathy, Vaccination site reaction

Symptom Text: Information has been received from a Health Authority (case n. 114942, local case n. IT176/10) concerning a 11 year old female who on 18-MAR-2010 was vaccinated with the first dose of GARDASIL (batch number NK31720, lot number NJ37700) IM in the right deltoid. On the same day she presented with pain in the right arm and swelling. She was treated with TACHIPIRINA with little benefit. On 19-MAR-2010 onset of paresthesia right arm and pain left arm. She was taken to the Emergency Room (ER) where she was treated with ice packs and TACHIPIRINA. On 20-MAR-2010 neurological consultation and electromyography that was negative. On 23-MAR-2010 she was admitted to the hospital for contraction to the shoulder and right hand. A rachicentesis performed showed radiculoneuritis. The outcome was recovered on 27-MAR-2010. HA coded muscle contraction, paresthesia, polyradiculoneuritis and vaccination site reaction. The case is closed. Other business partner numbers include E2010-02307.

MedDRA PT Cutaneous vasculitis, Emotional distress, General physical condition abnormal, Infection, Leukocytoclastic vasculitis, Vaccine positive rechallenge

Symptom Text: Information has been received from a Health Authority (reference number PEI20100008572) concerning an 18 year old female patient with a history of allergic rhinitis who on 17-OCT-2007 was vaccinated with the first dose of GARDASIL (batch number NG01520, lot number 1536F). Concomitant therapy included cetirizine every spring time due to allergic rhinitis. Two reporting forms with ambiguous information were sent. According to one the onset was in October 2007, according to the other the onset was on 12-NOV-2007. No symptoms were reported. According to a histologic finding, the patient had a "cutaneous vasculitis of small blood vessels with leucocytoclastic vasculitis of the lower extremities" beginning at the legs, in May 2009 additionally arms and trunk were concerned. The patient was treated initially with corticosteroids and mycophenolate (April 2009). Under treatment with azathioprine from May to October 2009 the symptoms stopped but reappeared at both lower legs after stop of treatment. At the time of reporting the patient had not recovered. One the reporters stated a "persisting damage". The patient was vaccinated with the second (batch number NG00020, lot number 0277U) and third dose (batch number NG00020, lot number 0277U) of GARDASIL on 07-DEC-2007 and in September 2008 (1st or 9th, difference between both reporting forms), respectively with positive rechallenge of vasculitis. Additional symptoms appeared after "physical and mental stress" and in the scope of infections. HA coding: leucocytoclastic vasculitis and vasculitis. Additional information has been requested. Other business partner numbers include E2010-02330.

MedDRA PT Aplastic anaemia, Bone marrow transplant, No reaction on previous exposure to drug

Symptom Text: Information has been received from a health authority (HA ref. DK-DKMA-20100331) on 08-APR-2010. It was reported that a 15 year old female patient (weight 50 kg, height 160 cm) who on 29-JUN-2009 was intramuscularly vaccinated with the third dose of GARDASIL (site of administration not reported). On 10-AUG-2009, the patient was diagnosed severe aplastic anaemia. As a consequence, the patient underwent bone marrow transplantation on 07-SEP-2009. It was reported that the bone marrow transplantation was successful and that the patient recovered (not further specified). Date and duration of hospitalization was not reported. It was reported that it was unlikely that the vaccination could have caused the aplastic anaemia. The patient was vaccinated with the first and second dose of GARDASIL (batch number, route and site of administration not reported) on 18-DEC-2008 and 19-FEB-2009, respectively. No adverse reaction was reported. Severe aplastic anaemia and bone marrow transplant were considered to be immediately life-threatening by the Health Authority. Case is closed. Other business partner number include E2010-02277. No further information is available.

MedDRA PT Activities of daily living impaired, Asthenia, Decreased appetite, Dyskinesia, Eyelid disorder, Fall, General physical health deterioration, Headache, Mastication disorder, Muscle contractions involuntary, Muscular weakness, Nausea, Palatal disorder, Speech disorder, Weight decreased

Symptom Text: Information has been received from a healthcare professional on 06-APR-2009. It was reported by a gynaecologist that a 14 year old female patient was vaccinated with a first dose of GARDASIL (lot # 1201U, batch # NG29050) SC into the left upper arm on 06-FEB-2009. A few days P.V. the patient developed asthenia and weakness of the knee joints ("knees like pudding"), so she "slumped down". The final outcome was unknown to the reporter. Follow up information received on 12-APR-2010. Based on additional information from Health Authority (reference number PEI2010003705), this previously non-serious case was updated to serious with hospitalization as serious criteria. Approximately one to two weeks post the vaccination the patient's general condition increasingly reduced. The patient lost of appetite with a loss of weight (15kg) and experienced chewing difficulty and hindered closing of her mouth. Additionally her knee "buckled". Because of muscle weakness of the legs she could not attend sports at school anymore. Since November 2009 the patient showed speech disorder (indistinct/"washy" speech). Since January 2010 the patient could not completely close her eyelids, soft palates were "hanging" and she experienced fasciculation of tongue, headache and nausea. On 13-JAN-2010 the patient was hospitalized and treated with logopedics and physiotherapy. Investigations like MRI and lumbar puncture were normal. Up to the time of reporting to HA (20-JAN-2010) no diagnosis was established nor drug treatment was started. The outcome was "unknown". HA code: appetite lost, fasciculation, headache, loss of weight, muscle weakness, speech disorder, reduced general condition and chewing difficulty. Other business partner numbers included: E200903046. No further information is available. File closed.

MedDRA PT Condition aggravated, Myasthenia gravis

Symptom Text: Information has been received from a health authority (HA reference No. PEI2009032065). A 26 year old female patient with history of myasthenia gravis with diplopia in 2006 and CIN II (cervical intraepithelial neoplasia grade II) was vaccinated with the first dose of GARDASIL on 16-JUN-2009 (Lot #, injection route and site not reported). Concomitant therapy included hormonal contraceptives (unspecified), levothyroxine Na and NEXIUM MUPS. On 21-Jun-2009, the patient developed a relapse of myasthenia gravis (second occurrence of myasthenia). The patient was treated with 50 mg prednisolone daily from 21-JUN-2009 to 17-AUG-2009, then 30 mg daily. A blood sample was taken on 07-JUL-2009. Autoimmune antibodies (against acetylcholine receptor or MUSK: muscle specific kinase, not specified) showed a value of 16.91 nmol (normal: < 0.20 nmol). A thoracic MRI (date not reported) had shown no enlargement of thymus and therefore no thyrectomy was performed. A second dose of GARDASIL was administered on an unspecified date and was well tolerated. Duration and outcome were not reported. The reporting agency considered myasthenia gravis aggravated to be other important medical event. Other business partner numbers include E2010-02239. The file is closed. No further information is available.

Other Meds: NEXIUM MUPS; hormonal contraceptives (unspecified); levothyroxine Na

MedDRA PT Amnesia, Condition aggravated, Dizziness, Headache, Loss of consciousness, Musculoskeletal stiffness, Syncope

Symptom Text: Information has been received from a health authority (HA reference No. ES-AGEMED-914617346). A 15 year old female patient was vaccinated IM with a dose of GARDASIL on 09-NOV-2009 (batch # and site of administration not reported). After receiving the vaccination with GARDASIL the patient experienced loss of consciousness, which was preceded by light-headedness and stiff limbs. The patient was taken to the emergency room due to residual headache and amnesia of the syncope episode. It was reported that the patient had had a prior syncopal episode after having a blood sample taken. To be noted, the health authorities coded only syncope, felt faint and rigidity of limbs. According to the report the patient recovered from syncope, rigidity of limbs and felt faint on the same day, 09-NOV-2009. No further information was reported. Case reported as serious by the health authority with other medically important condition as criteria. The case is closed. Other business partner numbers include E2010-02240. The file is closed. MedDRA PT Convulsion, Epilepsy

Symptom Text: Information has been received from a physician concerning a 15 year old female patient who on 22-APR-2008 was vaccinated with the first dose of GARDASIL (lot# not reported). On 08-MAY-2008 the patient developed a seizure. The patient then received the second dose of GARDASIL (lot# not reported) on 25-JUN-2008 and then was given the third dose of GARDASIL (lot# not reported) on 13-OCT-2009. The physician reported that the patient did not have any experiences after receiving the other doses, but the patient believed they had a seizure because of GARDASIL. At the time of this report, the patient's outcome was unknown. Additional information has been received from the physician concerning the patient who on 22-APR-2008 was vaccinated with first dose of GARDASIL (lot# 660387/1967U). The patient then received the second dose of GARDASIL (lot# 660553/0070X) on 25-JUN-2008 and then was given the third dose of GARDASIL (lot# 660612/0229X) on 13-OCT-2009. The physician reported that the patient did not receive any concomitant vaccinations when she received the GARDASIL vaccinations. The patient's grandmother called the physician on 08-APR-2010 and reported that the patient was experiencing a seizure about once a month. The patient was seeing a neurologist. The physician did not consider the seizures to be disabling or life-threatening and the patient was not hospitalized. Upon internal review, seizure was considered to be an important medical event. Additional information has been requested. MedDRA PT Diabetes insipidus, No reaction on previous exposure to drug

Symptom Text: Case received from Health Authority on 12-APR-2010 (reference # PEI2010005944) : A 17 year old female on 04-OCT-2007 was vaccinated with the first dose of GARDASIL (lot # 1536F, batch # NG01520) which was well tolerated. On 11-DEC-2007 the patient received the second dose (IM, lot # 0253U, batch # NF58540) IM into the upper arm. On 31-JAN-2008 the patient was presented to a physician and diabetes insipidus was diagnosed which was confirmed by MRI and endocrinological examinations (not otherwise specified). The patient was treated ambulatory. Upon reporting form dated 02-MAR-2010 the patient had not recovered and "permanently damage" was ticked. Diabetes insipidus was considered to be disabling. Other business partner numbers included E2010-02328.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Facial palsy

Symptom Text: Information has been received for the pregnancy registry for GARDASIL from a physician concerning a 20 year old female patient, who in October 2009, "6 months ago", was vaccinated with the first dose of GARDASIL (route and lot number not provided). A couple of weeks after 1st dose, the patient got pregnant. The patient also developed Bell's Palsy after receiving the first dose but had a miscarriage sometime after developing Bell's Palsy. It was reported that the Bell's Palsy was getting better at the time of reporting. The patient's outcome regarding the miscarriage was unknown. The patient sought unspecified medical attention via office visit. Upon internal review, miscarriage was considered to be an other important medical event. Additional information has been requested.

MedDRA PT Biopsy brain abnormal, Blood glucose normal, Brain oedema, CSF glucose normal, CSF lactate normal, CSF oligoclonal band absent, CSF protein normal, CSF white blood cell count, CSF white blood cell count negative, Culture negative, Demyelination, Fundoscopy normal, Granulocyte percentage, Headache, Hemiparesis, Histology abnormal, Lymphocyte count increased, Lymphocyte percentage decreased, Macrophages increased, Mycobacterium test negative, Optic nerve disorder, Parasite blood test, Plasmapheresis, Pupillary deformity, Red blood cell sedimentation rate normal, Rheumatoid factor negative, Sensory loss, Toxoplasma serology, Vasogenic cerebral oedema, Visual acuity reduced, White blood cell count normal

Symptom Text: It was reported in a published article, title as stated above that a 16-year-old previously healthy girl presented 10 the emergency room with an acute onset of visual loss over 48 hours. Initially, there was visual loss noted in the right eye accompanied by a left side headache. These symptoms worsened over the next 24 hours to include visual loss involving the left eye with a more diffuse headache. When evaluated in the emergency room at 48 hours after onset, her vital signs were blood pressure 116/65, pulse 68/minute, respirations 14/minute, and temperature 98 degrees F, with a completely normal general physical examination and no signs of systemic illness. Her examination disclosed a visual acuity of only counting fingers bilaterally with mild left side weakness accompanied by sensory loss to pinprick in the left arm. There was a left afferent pupillary defect and normal fundoscopic examination. Her visual ability deteriorated further to inconsistently identifying light and movement from the left eye only. She complained of no other symptoms and denied antecedent trauma or prodromal illness. She had, however, received her second vaccination against human papilloma virus 10 days prior to her presentation. There was no family history of demyelinating disease, collagen-vascular disease, or rheumatological disorders. Magnetic resonance imaging (MRI) of the brain showed swollen enhancement within the chiasm extending into both retrobulbar optic nerves and a right occipitoparietal lobe mass (later disclosed as tumefactive demyelination) with a large zone of surrounding vasogenic edema. Complete spine MRI was normal. Biopsy of the hemispheric mass was performed and histology revealed demyelination. Subsequent cultures for aerobic and anaerobic bacteria, fungus, acid fast bacilli, and examination for parasites were negative as were serum immunoglobulin G and immunoglobulin M titers for Toxoplasma gondii. The erythrocyte sedimentation rate was 16 and the white blood cell count was 6900 with 89% granulocytes and 9% lymp

MedDRA PT Convulsion, Gaze palsy, Hypotonia, Immediate post-injection reaction, Muscle rigidity

Symptom Text: Information has been received from a health care professional concerning a 15 year old female patient. The patient was usually healthy. She had received the first dose of GARDASIL with no problems. The patient received the second dose of GARDASIL (batch number NK31480, lot number NJ28290, expiry in September 2010) in the left arm on 30-MAR-2010. On 30-MAR-2010, less than a minute post vaccination, the patient had a small fit. She went limp and her eyes rolled and then she went rigid. The patient recovered 1-2 minutes later. The patient's blood pressure was checked and was normal and she was examined by the doctor and there were no problems. The patient fully recovered on 30-MAR-2010 and was planning to receive the third dose. Small fit, went limp, eyes rolled and went rigid was considered to be an other important medical event. Other business partner numbers included: E2010-02489.

MedDRA PT Activities of daily living impaired, Alopecia, Amnesia, Ataxia, Burning sensation, Conversion disorder, Deafness, Dizziness, Dyspnoea, Eating disorder, Erythema, Fatigue, Feeling cold, Gait disturbance, Headache, Hyperhidrosis, Hypersomnia, Hypoaesthesia, Menstruation irregular, Migraine, Muscle spasms, Muscular weakness, Nausea, Nervous system disorder, Neurological examination abnormal, Pain, Pallor, Palpitations, Paraesthesia, Phonophobia, Pyrexia, Rash, Rhinorrhoea, Screaming, Skin warm, Stress, Swelling, Tremor, Upper respiratory tract infection, Vision blurred, Weight decreased, Wrong drug administered

Symptom Text: Wrong shot given 12/26/08 (another meningitis shot given, instead of HPV #3). 1/6/09, upper respiratory infection, headache. 1/14/09 headaches worsen. Respiratory cleared up with antibiotics/looked like pneumonia. 1/15/09 dizziness. 1/28/09, headaches spike to levels 5-7 out of 10, 100% of the time. Ibuprofen does not work (800 mg). Mid feb: saw dr. Augmentum given for possible sinus infection. Headaches worsen, nasal fluid leakage continues. Augmentum does nothing. CAT scan MRI to be ordered within 5 days of Augmentum. Headaches spike to 7-8 100% of the time. Dizzy, no focus, loss of memory. Removed from school. Saw chiropractor - no one could touch the back of her head (meninga area) without her screaming. Says her head feels swollen and numb. Spine starts to burn. 2/15/09 8 pm, headaches go to 10/10, patient screaming. Consider possibility of brain tumor and take her to ER. Has trouble walking in straight line. CAT scan ordered by ER. Doctor send her home and tells her to take 2 Tylenols and 3 ibuprofens. CAT scan normal. 2/17 saw pediatrician again. Full blood work ordered: tests vitamin D, thyroid function, regular bloodwork. Referred to neurologist. 2/19/09 Dr. agrees problem could have been caused by cross reactions of Gardasil and Menactra: gives her Topomax at 50 mg/day and orders MRI. 2/20/09: MRI looks normal. Spine still burning, back of head untouchable, having more touble walking in a straight line. 2/23/09 2nd day of Topomax. Can only walk in 45 degree angles....cannot walk to bathroom. Go to ER, where she is seen by a team on neurologists and admitted to hospital for next 3 days. Ibuprofen administered via IV. No repsonse. 2nd day: DHE administered, which takes effect and after 3rd day she is released. March and April '09: patient can get through 2-4 hours of school each day and in the midst of that, needs a 1 hour rest on couch in office at school. Most days I pick her up at lunch. She is pale and very dizzy, with headaches reoccurring daily. Typically levels 4-5, with 7-8 spikes. She lose Th

Seriousness: HOSPITALIZED, LIFE THREATENING, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abasia, Activities of daily living impaired, Alopecia, Amnesia, Ataxia, Blood human chorionic gonadotropin negative, Blood test normal, Burning sensation, Cardiac monitoring, Computerised tomogram normal, Condition aggravated, Conversion disorder, Deafness, Dizziness, Dyspnoea, Eating disorder, Echocardiogram, Erythema, Fatigue, Feeling cold, Full blood count, Gait disturbance, Headache, Hyperaesthesia, Hyperhidrosis, Hypersomnia, Hypoaesthesia, Menstruation irregular, Migraine, Muscle spasms, Muscular weakness, Nausea, Nervous system disorder, Neurological examination abnormal, Pain, Pallor, Palpitations, Paraesthesia, Phonophobia, Pyrexia, Rash, Rhinorrhoea, Screaming, Skin warm, Stress, Swelling, Thyroid function test, Tremor, Upper respiratory tract infection, Vision blurred, Vitamin D, Wrong drug administered

Symptom Text: This report was identified from a line listing obtained on request by the company from the FDA under the Freedom of Information Act. A 14 year old female with conversion disorder and had an allergy of rash to red food dyes and a history of central auditory processing defect who on 31-DEC-2008 was vaccinated in right arm with a dose of GARDASIL (lot # 660616/0570X). Secondary suspected vaccination included a dose of MENACTRA. A 14 year old female experienced activities of daily living impaired, alopecia, amnesia, ataxia, burning sensation, conversion disorder, deafness, dizziness, dyspnoea, eating disorder, erythema, fatigue, feeling cold, gait disturbance, headache, hyperhidrosis, hypersomnia, hypoaesthesia, menstruation irregular, migraine, muscle spasms, muscular weakness, nausea, nervous system disorder, neurological examination abnormal, pain, pallor, palpitations, paraesthesia, phonophobia, pyrexia, rash, rhinorrhoea, screaming, skin warm, stress, swelling, tremor, upper respiratory tract infection, vision blurred and wrong drug administered. On 26-DEC-2008, the patient was given a wrong shot (another meningitis shot given, instead of the third dose of GARDASIL). On 06-JAN-2009, the patient experienced upper respiratory infection, headache. On 14-JAN-2009 headaches worsen. Respiratory cleared up with antibiotics/looked like pneumonia. On 15-JAN-2009, the patient experienced dizziness. On 28-JAN-2009, headaches spike to levels 5-7 out of 10, 100% of the time. Ibuprofen did not work (800 mg). In the middle of February: the patient saw doctor. AUGMENTIN was given for possible sinus infection. Headaches worsen, nasal fluid leakage continued. AUGMENTIN did nothing. CAT scan MRI to be ordered within 5 days of AUGMENTIN. Headaches spike to 7-8 100% of the time. Dizzy, no focus, loss of memory. The patient then removed from school. Saw chiropractor - no one could touch the back of her head (meninga area) without her screaming. Said her head felt swollen and numb. Spine started to burn. On 15-FEB-2009 at 8:00 pm, hea

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Caesarean section, Drug exposure during pregnancy, Foetal heart rate decreased

Symptom Text: Information has been received from a healthcare worker concerning a 28 year old female patient with a history of miscarriages and no history of drug reactions/allergies who on 02-Jun-2009 was vaccinated IM with the first dose of GARDASIL (Lot #658271/0558X) 0.5ml. There were no concomitant medications. The patient was pregnant at the time of report. Her last menstruation period date is 28-Dec-2008 and her estimated delivery date is 04-Oct-2009. The patient has an irregular menstrual cycle and had a negative pregnancy test on 02-Jun-2009 before receiving GARDASIL (Lot #658271/0558X). There were no adverse effects reported. Additional information has been received as reported by the physician that the patient received the first dose of GARDASIL (Lot # 658271/0558X) on 02-Jun-2009 and before receiving GARDASIL (Lot # 658271/0558X) a pregnancy test was done but it came back negative. Then today 01-Jul-2009 the patient called the office and reported that she had taken a home pregnancy test and she was pregnant. The physician also reported that the patient has a history of miscarriages. No adverse effect involved. Follow up information has been received which stated that on an unspecified date the patient delivered a normal baby with no congenital anomaly, who on unspecified date experienced irregular heart rate and was hospitalized (WAES:0907USA00225B1). Follow up information has been received from an other health professional who reported that at 36 weeks of pregnancy the baby's heart rate was decreasing in the office so they sent the patient to the hospital. The patient had a C-section for the decreased heart rate. The baby's heart rate continued to be irregular and the child was sent to the hospital (WAES:0907USA00225B1). It was stated that this was the first mother's C-section of 13 pregnancies. The patient had 8 preemie babies. 2 full term babies and some miscarriages. Additional information has been requested.

Symptom Text: Fibromyalgia symptoms: excruciating pain-back, chest, neck, arms, hips and legs, headaches, muscle weakness, generalized swelling-all over body, muscle knots, muscle spasms, insomnia, difficulty concentrating, limited mobility, limited range of motion. Symptoms started in Sept 2009, at onset was mainly back pain with symptoms progressively worsening to date. Treatment -Oct 2009, diagnosed with thoracic sprain, pain med and prednisone prescribed. Primary care physician, Oct 29, 2009- ordered Mobic, Lortab, and Flexeril. Nov 11,2009 Dr -stopped Mobic and Flexeril and ordered Zanaflex and ibuprofen. Also ordered physical therapy. -started 11/12/2009. After several sessions stopped physical therapy due to increasing pain and inability to tolerate therapy. 11/25/09 MRI - cervical and lumbar. Several weeks of chiropractic care- stopped due to inability to tolerate and not improving. Spine clinic- Dr evaluated and referred. 12/16/09 Rehab -Several visits - trigger point injections, lidocaine patches, nortriptyline, Lexapro-no improvement. Psychologist-psych eval. - started in March 2010-Has tried several meds without success- Diagnosed with fibromyalgia and referred to another Dr. April 19, 2010, 1st appt with Dr and fibromyalgia diagnosis confirmed. Patient is taking several medications to try to help control symptoms-Neurontin, Savella, Klonopin, and Ultram but so far still no improvement. She still remains in excruciating uncontolled pain along with increasing weakness, generalized swelling, muscle knots, muscle spasms, insomnia, difficulty concentrating, limited mobility and limited range of motion. The following information was obtained through follow-up and/or provided by the government. 4/28, 4/29 and 4/30/2010, Op rehab summary 11/12-11/23/2009, Urgent care clinic visit 10/22/2009, PCP ovs 10/29-11/19/2009, OP PT evaluation 11/12/2009 and MR, Adult Rehab MR 12/16/2009, Pain clinic ov 4/19/2010, Ortho spine MD ov's 3/1-4/19/2010, Dx fibromyalgia c/o's upper and lower back pain with bilateral UE pain and numbne

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Arthralgia, Back pain, Blood test, Chest pain, Disturbance in attention, Fibromyalgia, Headache, Impaired driving ability, Impaired work ability, Injection site pain, Insomnia, Joint range of motion decreased, Ligament sprain, Mobility decreased, Muscle disorder, Muscle spasms, Muscular weakness, Neck pain, Pain, Pain in extremity, Swelling, Wheelchair user

Symptom Text: Information has been received from a nurse concerning her 19 year old daughter with allergy to PERCOCET (had rash and itching) who on 23-JUL-2009 and 24-SEP-2009, was vaccinated with the first and second dose of GARDASIL (lot # 659964/1978U for dose 1, 661531/1311X for dose 2) IM into her left arm. Concomitant therapy included YAZ. The patient did not receive other vaccinations. On an unspecified date, the patient had complained that the shots were very painful at the injection site. Then by the end of September, the patient complained of back pain. On 22-OCT-2009, the patient was taken to an Urgent Care Center and was diagnosed with thoracic sprain. She was treated with pain medications and prednisone. On 29-OCT-2009, the patient was seen by a physician, her primary healthcare professional (HCP) at the time and was treated with MOBIC, cyclobenzaprine hydrochloride and LORTAB. On follow up visit of 11-NOV-2009, the physician recommended physical therapy and added ZANAFLEX and ibuprofen. The patient experienced fibromyalgia. On 12-NOV-2009, the patient went to another place for outpatient therapy. Stopped therapy made her feel too much pain. On 25-NOV-2009, priority radiology magnetic resonance imaging (MRI) was performed on thoracic, cervical and lumbar, and nothing was found. Then the patient went to chiropractor but stopped due to too much pain. The patient went to a spine Institute with another physician, and nothing was found. Then the patient was sent to an Associates on 16-DEC-2009 and was given lidocaine patches, and trigger point injections for muscle knots in neck and back. Other Medications included LEXAPRO and nortriptyline. On 30-DEC-2009, 06-JAN-2010 and 03-FEB-2010, the patient had other visits to this facility, but no improvement. The patient was seen at the place for outpatient therapy again for psychological evaluations one time, but did not return. In March 2010, the patient was seen by another physician as her primary care physician. In April 2010, she went to a hospital emergency room with "ex

MedDRA PT Arthralgia, Blepharospasm, Convulsion, Fatigue, Feeling cold, Incorrect route of drug administration, Injection site pain, Loss of consciousness, Narcolepsy, No reaction on previous exposure to drug, Pyrexia, Syncope, Tinnitus, Vision blurred

Symptom Text: Information has been received from a physician concerning a 12 year old female patient who on 21-JUL-2009, 22-OCT-2009 in the left arm and on 10-MAR-2010 (lot # 661530/1575X) was vaccinated with the first, second and third 0.5 ml doses respectively of GARDASIL. On 21-JUL-2009, the patient was vaccinated with the second dose of VARIVAX (Merck) and on 22-OCT-2009 a dose of intranasal FLUMIST "in different arm". It was reported that the patient experienced injection site pain and fever up to 101 degrees after getting the third dose of GARDASIL on 10-MAR-2010. On 31-MAR-2010, the patient experienced tiredness, pain in her knee, complaint of fainting, 30 seconds of eye twitching, her body felt cold and ringing in her ears. On 18-APR-2010, the patient experienced 45 seconds of blurred vision to black out, eyes twitching, seizures and ongoing severe fatigue. The physician suspected that it could be Narcolepsy. The patient sought unspecified medical attention. At the time of the report the adverse events reported as not improved and the patient's present status was reported as unspecified. Upon internal review seizures were determined to be other important medical event. Additional information has been requested. The following information was obtained through follow-up and/or provided by the government. 5/4 and 5/7/2010 PCP ov 4/19/2010 Dx ? possible seizures patient with c/o's feeling faint episodes, ears ringing, eyes twitch, felt cold, blurred vision, fatigue, fever and joint pain, mother felt due to vaccination (Gardisil) although patient did not have adverse reaction after first 2 injections

MedDRA PT Eyelid disorder, Oral pain, VIIth nerve paralysis

Symptom Text: Information has been received from a physician concerning a 10 year old female patient who on 13-OCT-2009 was vaccinated with the first dose of GARDASIL. Concomitant therapy included a dose of TWINRIX. One week later, on approximately 20-OCT-2009 the patient experienced paralysis of the 7th cranial nerve, mouth deviation and elevated eyelid. Those events lasted 1 month. At the emergency room, the physician told the patient's parents that the patient possibly had Bell's Palsy. It was unknown if paralysis of the 7th cranial nerve, mouth deviation and elevated eyelid were related to therapy with GARDASIL. Upon internal review, paralysis of the 7th cranial nerve was considered to be an other important medical event. No further information is available.

MedDRA PT Fatigue, Infectious mononucleosis, Lymphadenopathy, Malaise, Nausea, Pyrexia, Vomiting

Symptom Text: Case reported from a health care professional under the reference number RA-078-2010. A 17-year-old female patient received the first dose of GARDASIL (batch number, site of administration and route not reported) on 30-MAR-2010. One week post vaccination (approximately on 06-APR-2010), the patient presented with fever, cervical lymphadenopathy, nausea, vomiting, general malaise, fatigue that have finished on unspecified date. The patient went to the primary care physician and he had requested complementary tests. As the result of analytical exams were very high (not otherwise specified), the patient was hospitalized on 13-APR-2010 and discharged on 14-APR-2010 with a prescription of BEN-U-RON (also reported as concomitant therapy) to be used in case of fever. The preliminary diagnosis was viral hepatitis. However, the nurse was informed by the patient's mother that the diagnosis of viral hepatitis was ruled out at the hospital. The final diagnosis was mononucleosis and, according to the reporter it was not related with the vaccine. The patient had recovered on an unspecified date. No further information is available. Other business partner numbers include E2010-02518.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Haemorrhage

Symptom Text: Information has been received from a registered nurse as part of the pregnancy registry for GARDASIL, concerning a 24 year old Rh negative female patient with no known drug allergies, history of 4 pregnancies: 3 elective abortions (no dates provided), 1 live birth and a LEEP procedure on 07-DEC-2009 who "elsewhere about 3 years ago" was vaccinated with the first dose of GARDASIL and on 12/28/2009 was vaccinated with the second dose of GARDASIL (Lot# 663454/0672Y). The patient had an "UCG" test positive at home, an ultrasound was performed on 22-APR-2010 and showed a nonviable pregnancy. The nurse reported that the patient started bleeding on 22-APR-2010 (also reported as mid April) and was diagnosed with a spontaneous abortion. LMP: 12-FEB-2010; estimated due date 19-NOV-2010. The products of conception were examined in the office but not sent to the lab The event was not considered disabling or life threatening; there was no hospitalization. The patient had recovered. Upon internal review spontaneous abortion was considered to be other important medical event. Additional information is not expected.

Other Meds: Unknown

Lab Data: ultrasound, 04/22/10, showed a nonviable pregnancy; beta-human chorionic, positive, at home

History: Loop electrosurgical excision procedure

Prex Illness: Pregnancy NOS (LMP = 2/12/2010); Rhesus antibodies negative

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Encephalitis, Incorrect route of drug administration

Symptom Text: Information has been received from the Health Authorities under the reference numbers CN20100207 and CN090047. A 20 year old female patient experienced an encephalitic reaction after she had received a subcutaneous injection of GARDASIL (batch number not reported) on 01-FEB-2009. The case was identified as a misuse (incorrect route of administration), although not reported as such by the HA: the recommended route for GARDASIL was the intramuscular one. The patient had no relevant personal medical history. A few days after vaccination, the patient experienced an encephalitic reaction and was hospitalized. CT angiography, brain CT scan and MRI scan were normal. The patient recovered on 12-FEB-2009. The health authorities assessed the causal relationship between the reported reaction and the vaccination as (doubtful) (C1 S1 L1) according to the foreign method of assessment. The seriousness criterion reported by the HA was hospitalization. The HA coded the event of encephalitic reaction. Other business partner included E2010-02626. No further information is available.

MedDRA PT Abasia, Anaemia, Arthritis, Echocardiogram normal, Gait disturbance, Haematuria, Iron deficiency, Joint swelling, Liver function test abnormal, Local swelling, Lymphadenopathy, Musculoskeletal stiffness, Myositis, Neck pain, Night sweats, Oedema peripheral, Oropharyngeal pain, Pain in extremity, Pericardial effusion, Pruritus, Pyrexia, Rash, Rash papular, Septic rash, Ultrasound Doppler normal, Urinary tract infection

Symptom Text: Information has been received from a laboratory technician, concerning her 19 year old daughter, with no pertinent medical history and no known drug allergies, who on 08-JAN-2008, was vaccinated with the first dose of GARDASIL (dose and route not provided) (lot number 659657/1487U). On 06-MAR-2008, the patient received the second dose of GARDASIL (dose and route not provided) (lot number 659657/1487U). On 15-JUL-2008, the patient received the third dose of GARDASIL (dose and route not provided) (lot number 660389/1968U). Concomitant therapy included hormonal contraceptives (unspecified). There were not concomitant vaccines administered. On 28-DEC-2008, the patient experienced neck stiffness which eventually became a swollen neck. On approximately 08-JAN-2009, "after the first week and a half", the patient had night sweats with a fever. On 15-JAN-2009, "a week after the nights and fever" the patient broke out with a septic rash on her legs, then went to urgent care. On 15-JAN-2009, the patient got a computed axial tomography scan on her neck and found enlarged lymph nodes. On 16-JAN-2009, the patient got a computed axial tomography scan of the abdomen and showed enlarged lymph nodes and pericardial "infusion". On 26-JAN-2009, "the end of January", the patient was hospitalized for 5 days because her left leg was swollen and the patient could not walk on it. The patient's feet and toes were swollen as well. On 27-JAN-2009, the patient ended up having an ultrasound (also reported as sonogram) of the left leg, and showed swelling but no blood clots. On 30-JAN-2009, the patient had a magnetic resonance imaging of the ankle and calf and the result was negative. The patient was also tested for Guillain-Barre and Epstein-Barr virus and both were negative. Prescription treatment included pain medications (unspecified), steroids (unspecified) and antibiotics (unspecified). The patient sought chiropractic care and was seen by a rheumatologist. No diagnosis was made. On an unknown date, the patient initiated a peripherally in

MedDRA PT Convulsion, Electroencephalogram, Laboratory test

Symptom Text: Initial and follow-up information has been received from a registered nurse and a physician concerning a 14 year old female with no pertinent medical history who on 21-APR-2010 was vaccinated IM with a first dose of GARDASIL (lot # 663559/1178Y) and a dose of VAQTA (lot # 667009/0095Z). There were no concomitant medications. It was reported that on 21-APR-2010, five minutes after the vaccination, the patient experienced seizure which lasted about 1 minute. The patient went to the emergency room where lab work was done (results not specified) but she was not admitted. On 26-APR-2010, the patient had an EEG done (results pending). As of this date, the patient had not been referred to neurology or any other specialty, awaiting results of EEG. The patient recovered from seizure, but neither physician nor nurse would say if the event was disabling or life-threatening until further testing was done. Upon internal review, the event of seizure was considered an Other Important Medical Event. Additional information has been requested.

MedDRA PT Blood test, Myalgia, Viral infection, Wheelchair user

Symptom Text: Information has been received from a physician concerning a female patient with a history of obesity who on an unknown date, was vaccinated with a dose of GARDASIL (series, route and lot number unspecified). It was reported that the patient received other vaccines but which ones were unspecified. A week after the vaccination, "sometime in October or November 2009", the patient experienced muscle pain in their arms and legs so the patient went to the emergency room. At the emergency room, the patient had to be put in a wheel chair because of the muscle pain. A serum creatine kinase (CPK) test was performed an the levels were over 1000. A blood work test was performed and the results were not provided. A complete blood cell count (CBC) work up was performed and the results were that probably the patient had a viral infection (unspecified). The physician reported that the patient stopped the series of GARDASIL and had recovered (date not reported). The patient was initially seen by another physician. Viral infection was considered to be disabling by the physician. Additional information has been requested.

Other Meds: Unknown

Lab Data: Serum creatine kinase, over 1000; complete blood cell, probably viral infection

History: Obesity

Symptom Text: Information has been received from health authority (PEI2010003696). A general practitioner reported that a 13 year old female patient with a history of deliberate self-harm was vaccinated with a third dose of GARDASIL (lot number 0354U; batch number NF58150) on 22-SEP-2008. On 25-JUL-2009, the patient developed weakness of her leg, then she limped. As from 27-JUL-2009 the symptoms were increasing. On 28-JUL-2009 she was not any longer able to walk and was admitted to hospital. In addition, she experienced weakness of her hands up to the proximal wrists. A few weeks before admission she experienced recurrent dizziness from which she recovered spontaneously. One week before admission to hospital the patient had a left-sided mastitis. After oral treatment with cefuroxime (250 mg/twice a day) until 28-JUL-2009 she recovered from mastitis. Physical investigation revealed an absent patellar reflex, a hardly redeemable Achilles tendon reflex, missing muscle tone and strength in her legs and slightly reduced muscle tone and strength of her hands and arms. She could neither sit or stay. At admission routine laboratory values were within normal limits. During the further course CK increased up to 406. Serology was negative for Borrelia-IgC, mycoplasmas and enteroviruses-PCR. Gangliosid-antibodies had values of GM 1-antibodies IgM 13.1 and GD 1b-antibodies IgM 11.5. CSF was normal, the culture was sterile. CSF serology showed the following results: HSV- (herpes simplex virus) and VZV (varicella zoster virus) antibodies IgM were negative, HSV-DNA and picornavirus-RNA, enteroviruses-PCR negative. Stool sample was negative for rotavirus-antibodies, Helicobacter pylori-antibodies, picornavirus-RNA and enteroviruses-PCR. Shigella, Salmonella, Yersinia and Campylobacter had not been detected. An MRI of spinal column was performed on 29-JUL-2009 and showed normal results. An EMG (electromyogram) and nerve conduction velocity test revealed electroneurographical a generalized leg-emphasised radicular neurogenic lesion with absent F

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Central nervous system lesion, Demyelination, Disability, Multiple sclerosis, Neurological examination abnormal, Optic neuritis, Pleocytosis, Sensorimotor disorder, Spinal disorder, Visual impairment

Symptom Text: Information has been received from an health authority (reference PEI2009032426). A neurologist reported that a previous healthy 17 year old female patient received a complete vaccination series with three doses of GARDASIL IM on 22-SEP-2008 (first dose, lot number 1172U; batch number NH13130), on 24-NOV-2008 (second dose, lot number 1147U; batch number NH17630) and on 10-MAR-2009 (third dose, lot number 1147U; batch number NH17630). Approximately on 20-MAR-2010, ten days post vaccination, the patient experienced a first exacerbation of sensorimotor disorder of her right arm. The following nuclear spin resonance tomography showed multiple inflammatory cranial lesions with a cerebral focus in the area of cervical spin vertebral body 2/3. CSF showed lymphatic pleocytosis with 18 cells/mcl and oligoclonal bands. That time the patient was treated with a steroid high dose therapy and the immunomodulator COPAXONE. In May 2009 the patient experienced a left-sided optic neuritis and was again treated with a steroid high dose therapy. On 04-JUN-2009 the patient presented again to the outpatient department. The neurological examination showed an expanded disability status score (EDSS) of 1.0 points with a slight visual disturbance. The physician decided to continue immunomodulatory treatment with COPAXONE. On 18-SEP-2009 an MRI check-up of cervical, thoracal spine and cranium was performed. It showed right-sided frontal new demyelinating focuses with signs of activity. The other demyelinating focuses were unchanged since last MRI on 06-APR-2009. Further the MRI check-up of cervical and thoracal spine showed a regression of the multiple sclerosis plaque in the area of cervical spin vertebral body 2/3 since the last MRI on 06-APR-2009 but without being a normal results. Currently no signs of activity. HA coded: multiple sclerosis, sensory disturbance. Sensorimotor disorder, oligoclonal band CSF abnormal, Left-sided optic neuritis and expanded disability status score of 1.0 points with a slight visual disturbance were consid

MedDRA PT Cervical conisation

Symptom Text: Information has been received from a gynaecologist on 19-APR-2010. A 19 year-old female underwent a cervical conisation after she had received the 3 doses of GARDASIL (batch number(s) not reported) respectively in October 2007, January 2008 and April 2008. Following conisation, HPV typing was found negative. The outcome was not reported. Upon internal review the cervical conisation and human papilloma virus test negative were considered medically significant. The case was linked with serious WAES No: 1004USA04600. Other business partner numbers include: E2010-02586. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Activities of daily living impaired, Arthralgia, Dysaesthesia, Muscle tightness, Pain, Pain in extremity, Paraesthesia

Symptom Text: Information has been received from a health authority (HA) (reference number TO20091418) concerning a 16 year old female patient who on 04-MAY-2009 was vaccinated with a second dose of GARDASIL. Subsequently the patient developed paraesthesia in the upper limbs. She had received the first dose of GARDASIL on 07-MAR-2009. The patient was a tobacco user and had personal history of psychological difficulties following a death and after the separation of her parents. She also had an 11-kg weight loss further to dietary restrictions. The patient had long-term hormonal contraception. On 20-MAY-2009, the patient developed pains in the left elbow, subsequently extending to the forearm, then to the hand. Symptoms subsequently became bilateral. Pains were characterized by stretching, tightness and paraesthesia, with an onset time rather in the mornings and evenings. The physician suggested and adverse effect of GARDASIL to explain the cause of such paraesthesia. The Health Authority (HA) stated that paraesthesia appeared shortly after the second injection of GARDASIL. -Biological work-up: not available. -Non-drug induced aetiologies ruled out: clinical examination found no sign of sensorymotor deficit. There was no pyramidal syndrome, no issue with cranial nerves and no Lhermitte's sign. MRI of the cervical bone marrow was normal and no vitamin B12 deficiency was found. -Evolution: symptomatic treatment with low doses of RIVOTRIL in drops was implemented on 09-SEP-2009. However, as of 14-OCT-2009, dysaesthetic sensations of the upper limbs persisted. As of 17-NOV-2009, symptoms persisted but had slightly regressed. Practice of sports, ie handball, was still impossible for the patient. The health authorities assessed the causal relationship between the reported reaction and vaccination as doubtful (C2 S1 I1) according to the Foreign method of assessment. The seriousness criterion reported by the HA was "other medically important condition" (not specified). The HA coded the event of "paraesthesia upper limb". Other business

MedDRA PT Guillain-Barre syndrome, Haemangioma, Inflammation, Intervertebral disc disorder, Muscular weakness, Nerve conduction studies abnormal, Nerve root lesion, Nuclear magnetic resonance imaging spinal cord abnormal

Symptom Text: Information has been received from a foreign health authority (PEI2009030910). On 24-JUL-2009, a 15 year old female patient was vaccinated with a third dose of GARDASIL. On 25-AUG-2009 during hospitalization in AUG-2009 (no report was provided) the diagnoses of Guillain-Barre syndrome with polyradiculitis were established due to weakness of her lower extremities (onset not reported). A nuclear spin resonance tomography of the spinal canal (exact date not reported, in the time frame of the hospitalisation) had been performed for clarifying the diagnosis and had shown pathological findings in the area of the vertebral bodies which partially had been interpreted as Schmorl's nodes or as haemangioma. Under treatment with physiotherapy the symptoms improved and she had no more restriction in her daily life. On 27-OCT-2009, the patient presented to a neuro-pediatrician for follow-up investigations. The clinical examination showed no abnormal findings. The check-up of the motoric nerve conduction velocity of the peroneus nerve showed in comparison to the prior examination changes but still prolonged distal latencies and borderline amplitudes. Nevertheless the physician stated that the girl recovered completely from Guillain-Barre syndrome and polyradiculitis. A nuclear spin resonance tomography check-up of the spinal (date not reported) canal showed again the unchanged unclear pathological findings which were already interpreted as Schmorl's nodes or also as inflammatory changes. The outcome for these lesions was unknown. The final outcome was not reported. Previous doses of GARDASIL were given on 16-FEB-2009 and on 02-APR-2009, toleration was not reported. HA (PEI) coded: Guillain-Barre syndrome, polyradiculitis, Schmorl's nodes. Guillain-Barre syndrome, polyradiculitis, Schmorl's nodes, haemangioma and inflammatory reaction were considered to be other important medical events. The case was closed. Other business partner included: E2010-02697. No further information is available.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Pregnancy test, Ultrasound scan

Symptom Text: Information has been received from a Registered Nurse (R.N.) concerning an 18 year old female patient with no pertinent medical history and no known drug allergies/drug reactions who on an unspecified date was vaccinated with a dose of GARDASIL (Lot # not reported). There was no concomitant medication reported. It was reported that the patient was vaccinated with GARDASIL during pregnancy. The patient was seen at the practice. On an unspecified date a home pregnancy test and an ultrasound were performed (results not provided). The date of the last menstrual period was on 25-MAR-2009 and the estimated delivery date was 30-DEC-2009. Follow up information was received from a health professional. It was reported that they saw this patient only twice. The first time was in May 2009 and then on 08-JUN-2009 in the emergency room (ER). The patient was seen in the ER due to miscarriage. They have not seen the patients since that time. The reporter mentioned that the patient did not receive the HPV in their office. The patient had reported receiving it in April 2009. Upon internal review, miscarriage was considered to be an other important medical event. No further information is available.

MedDRA PT Brain scan normal, Encephalitis, Incorrect route of drug administration

Symptom Text: Information has been received from a health authority (CN20100207 and CN0900047) concerning a 20 year old female who on 01-FEB-2009 was vaccinated with GARDASIL subcutaneous (batch number not reported). This case was identified as a misuse by the company (incorrect route of administration), although not reported as such by the HA: the recommended route for GARDASIL is the intramuscular one. The patient had no relevant personal medical history. A few days after vaccination, the patient experienced an encephalitic reaction and was hospitalised. CT angiography, brain CT scan and MRI scan were normal. The patient recovered on 12-FEB-2009. The Health Authorities assessed the causal relationship between the reported reaction and vaccination as "doubtful" (C1 S1 I1) according to the foreign method of assessment. The seriousness criterion reported by the HA was hospitalisation. The HA coded the event encephalitic reaction. No further information is available. Other business partner included E2010-02626.

MedDRA PT Demyelination, Hypoaesthesia, Lhermittes sign, Muscular weakness

Symptom Text: Information has been received from a Health Authority under the reference GR-EOF-91687 and transmitted through a distributor, Vianex, under the reference: SPV10019. A 21 year old female patient with a family history of multiple sclerosis, had received a second single dose of GARDASIL, 0.5 mL, (batch # and site of administration not reported), via intramuscular route on 06-MAY-2009. Thirty days after the second dose, the patient presented numbness in her right hand fingers. She also presented right arm weakness. Subsequently, the feeling of numbness spread to the left side of her body. The patient also presented Lhermitte sign. Brain MRI revealed multiple demyelination foci. Cervical MRI revealed demyelination foci in A2. CSF electrophoresis showed oligoclonal IgG. The patient had not recovered at the time of the report. The patient had received a first dose of GARDASIL (batch # and site of administration not reported) via intramuscular route on 06-APR-2009. No concomitant medication was reported. Relevant test/Laboratory data: MRI revealed multiple demyelination foci and CSF electrophoresis showed oligoclonal IgG. Other business partners included: E2010-02838. Additional information has been requested.

Other Meds: None

Lab Data: magnetic resonance imaging, revealed multiple demyelination foci; diagnostic laboratory test, Cerebrospinal fluid electrophoresis showed oligonal IgG.

MedDRA PT Pruritus generalised

Symptom Text: Information has been received from a physician concerning a 14 year old female patient with no drug reactions or allergies who on 29-APR-2010 was vaccinated intramuscularly with a first dose of GARDASIL. On 29-APR-2010 the patient developed itching all over her body after receiving her first dose and only dose of GARDASIL. The patient sought unspecified medical attention and was given BENADRYL via intramuscular injection. No laboratory diagnostic studies were performed. On 29-APR-2010, the patient had fully recovered from this event. "The patient was given BENADRYL via intramuscular injection" was considered to be an other important medical event by the physician. Additional information has been requested.

MedDRA PT Confusional state, Convulsion, No reaction on previous exposure to drug

Symptom Text: Information has been received from a medical assistant concerning a 13 year old female with a history of attention deficit non-hyperactivity disorder and no drug allergies, who on 09-SEP-2009 was vaccinated with the first dose of GARDASIL (lot # 659054/0315Y, IM, 0.5ml), on 11-NOV-2009 with the second dose (lot # 663453/0249Y, IM, 0.5ml) and the third dose on 06-APR-2010 (lot # 659054/0315Y, IM, 0.5ml). Concomitant therapy included METADATE CD. On 06-APR-2010 the patient experienced a seizure less than 5 minutes after her third dose. The patient immediately regained consciousness with smelling salts. She was confused for less than 30 seconds. There were no labs or diagnostic tests performed. The patient received unspecified medical attention. On 06-APR-2010, the patient recovered. Follow up information has been received from the medical assistant indicating that the patient had no previous history of seizures and no problems after the first and second doses of GARDASIL. No other vaccine was given on 06-APR-2010. No treatment was required and no referrals were made. Upon internal review, the events were considered to be other important medical events. No further information is available.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a licensed practical nurse, for the Pregnancy Registry for GARDASIL, concerning a 22 year old female with no pertinent medical history, allergies or drug reactions who on 20-MAR-2009 was vaccinated with GARDASIL (lot no., dose and route not reported). The nurse reported that the patient was pregnant when the vaccine was administered. A pregnancy test was performed at the doctor's office that was positive. The patient's LMP was on 20-FEB-2009 and the EDD: 27-NOV-2009. Follow up information has been received from the licensed practical nurse regarding the patient. The nurse stated that the patient's last menstrual period was actually 15-FEB-2009 (previously reported as 20-FEB-2009). On 27-JUL-2009, patient experienced miscarriage at gestational age of 23 weeks. It was asked if there were any previous studies were done following the miscarriage to determine a reason but the nurse said no and mentioned that this was not the patient's first miscarriage. Miscarriage was considered to be an other important medical event. No further information is available.

MedDRA PT Immediate post-injection reaction, Muscle contractions involuntary, Mydriasis, Pallor, Reaction to previous exposure to any vaccine

Symptom Text: Information has been received from a physician concerning an approximately 24 year old female patient with no allergy in anamnesis who on 23-MAR-2010 was vaccinated with a dose of GARDASIL. On 23-MAR-2010, immediately after the administration, the patient became pale, her pupils expanded and she had fasciculation in her face. This lasted one minute. After one minute the symptoms disappeared, the patient was not hospitalized and she was able to go home. After this reaction occurred, the patient remembered that she had similar reaction after hepatitis vaccination (unspecified). At the time of the report, the patient recovered. Pallor, pupils expanded and fasciculation were considered to be other important medical events by the reporter. The causal relationship between pallor, pupils expanded and fasciculation and therapy with GARDASIL was unknown. No further information is available.

MedDRA PT Auricular swelling, Bedridden, Burning sensation, Erythema, Gait disturbance, Henoch-Schonlein purpura, Hypersensitivity, Inflammation, Neutrophil count normal, Oedema peripheral, Pain in extremity, Red blood cell count normal, Viral infection

Symptom Text: This case was initially reported by the mother of the patient on 09-APR-2010. Additional information was received from a healthcare professional on 12-APR-2010. A 16 year old female was vaccinated with the first dose of GARDASIL (batch #NL30760, lot # 1334X, site and route not reported) in the left arm on 30-MAR-2010. 2 days post vaccination, on 01-APR-2010 the patient experienced swelling of the left ear, something that lasted for 3 days. She was all red in the ear (onset not reported) and therefore visited the doctor on 06-APR-2010. The doctor suspected ear inflammation and prescribed KAVEPENIN (Meda), cortisone nose spray (manufacturer unknown) and ear drops (manufacturer unknown). Some time after the visit to the doctor, the girl developed swelling of feet and fingers (one finger on each hand was affected), redness and pain of both feet and a burning sensitivity in the feet. The patient revisited the doctor on 08-APR-2010 due to the symptoms of hands and feet and the doctor concluded that the girl was not suffering from an ear inflammation, but most likely experiencing some kind of allergic reaction. The doctor said it could be had been the ear drops (later ruled out) or perhaps vaccination with GARDASIL that had caused the symptoms. 10 microgram CETIRIZIN (Sandoz) was prescribed and she was told to stop the treatment with penicillin, nose spray and ear drops (prescribed on 06-APR-2010). On 09-APR-2010, the girl was feeling better and could now walk without difficulties. According to her mother, she was improving as the day progressed. Test performed on 08-APR-2010: CRP 13, urine sample was OK except for erythrocytes 80 and albumin 0.3, blood tests (for instance erythrocytes and neutrophils) were all normal, Hemoglobin 125g/l and thrombocytes 301. According to the medical record from 08-APR-2010 allergic purpura was diagnosed and the doctor had added "reaction due to virus". However, the doctor did also judge it possible that the cause of the adverse events was GARDASIL. During the winter season 2009/2010 the

MedDRA PT Convulsion

Symptom Text: Information has been received from a nurse from the County Health Unit concerning a 14 year old female who on 21-APR-2008 was vaccinated with a third dose of GARDASIL at school. On 26-MAY-2008, 35 days after the patient received her third dose, she began suffering from seizures and has continued since then. When the patient first started having seizures she was admitted to the epilepsy unit of a hospital for 1 week. Her EEG (electroencephalography) was normal then as well as her MRI (magnetic resonance imaging). It was reported that the patient has continued to have seizures, she could sometimes have clusters of them that could last up to 40 minutes. The seizures sometimes occurred daily and other times she only had them 2 or 3 times a week. Causal relationship between GARDASIL and seizures was not reported. Additional information has been requested.

MedDRA PT Abnormal labour, Breech presentation, Caesarean section, Drug exposure during pregnancy, Prolonged labour

Symptom Text: Information has been received from a female, for the Pregnancy Registry for GARDASIL, concerning her 16 year old daughter with no pertinent medical history or drug reactions/allergies who on 10-APR-2009 was vaccinated with one dose of GARDASIL. The patient became pregnant. The urine pregnancy test was performed in the office. The patient's last menstrual period was 25-MAR-2009, her estimated delivery date was 30-DEC-2009. It was reported that her pregnancy was normal to date. Additional information was received from a health professional concerning that a 16-year-old female patient with no per-existing allergies, birth defects or medical conditions was vaccinated IM in the deltoid region of the right arm with the first dose of GARDASIL vaccine (Lot # 661046/0546X) at 16:00 PM on 10-SEP-2009. The patient was unaware of pregnant at the time of injection. There were no adverse events reported. The patient had no illness at time of vaccination. The patient had no other concomitant medications. Follow-up information has been received from a physician indicated that the patient with no significant past medical history and no family history or smoking history with no obesity and with no previous pregnancies, no pre-term deliveries, no spontaneous abortions, no elective terminations, no stillbirths and on full term delivery who was vaccinated with the first dose of GARDASIL on 10-APR-2009. Concomitant medication included prenatal vitamins from June 2009 to December 2009 daily for pregnancy. The prenatal testing included: On 23-JUN-2009 at 13 weeks and on 18-AUG-2009 at 21 weeks ultrasound for survey of anatomy revealed normal female, on an unspecified date amniocentesis revealed fetus, on 23-JUL-2009 MSAFP for screening for anomalies revealed WNL. On approximately 22-DEC-2009 the patient experienced protracted labor as complication during labor/delvery. On 22-DEC-2009 the patient delivery a normal female infant with weight 6 pound 13 oz, length 19.5 inch, Apgar score 7/9, head circumference 14 inch. The weeks from LMP we

MedDRA PT Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse for GARDASIL, a pregnancy registry product, concerning a 19 year old female patient with medical history of smoke and might have conceived on NUVARING, plan B who on 31-AUG-2007 was vaccinated IM with 0.5 ml dose of GARDASIL (Lot#661846/1312X) at left deltoid. There was no concomitant medication. On 21-AUG-2009 the patient was vaccinated IM with the second 0.5 ml dose of GARDASIL. On 31-AUG-2009 the patient took a urine home pregnancy test and it was positive. The patient came into the office for a pregnancy visit on 22-SEP-2009. On this visit ultrasound performed and estimated due date would be 05-MAY-2010. The last menstruation period was approximately 31-JUL-2009. The patient was not experiencing any problems, there were no adverse effects report. Follow up information has been received from the nurse who reported that on 20-OCT-2009 the patient called to cancel her appointment. Message stated cancellation due to possible miscarriage or termination of pregnancy. No further information noted. On 19-NOV-2009, the nurse left a message for the patient to call the office. There was no follow up phone calls from patient. The nurse was unable to contact again in April 2010 because the phone number is no longer in service. There was no further information and none was anticipated. Possible miscarriage or termination of pregnancy was considered to be an other important medical event. Additional information is not expected.

MedDRA PT Condition aggravated, Demyelination, Hypoaesthesia, Monoparesis

Symptom Text: Information has been received from a Health Authority (ref. # GR-EOF-91689), via VIANEX (ref. # SPV10021), concerning a 22 year old female patient who on 15-MAY-2009 received a second single dose of GARDASIL (lot #, batch # and site of administration not reported) via intramuscular route. The patient presented right leg paresis and left arm numbness a few days after the second dose of GARDASIL. The symptoms lasted for approximately 1 week. Brain and cervical MRI was performed in June 2009, showing multiple demyelinating foci. CSF electrophoresis showed oligoclonal IgG. The outcome of the reactions was not reported. Previous MRI, performed in November 2008, was normal. The patient had a history of right arm paresis in June 2007 (duration 1 month), facial nerve paresis in June 2008 (duration not specified), diplopia in November 2008 (duration 5 days) and leg paresis. The patient had received a first dose of GARDASIL on 15-MAR-2009. No concomitant medication was reported. This report is serious due to patient was hospitalized (dates not reported). Other business partner numbers include E2010-02836. Additional information has been requested.

MedDRA PT Convulsion, Syncope

Symptom Text: Information has been received from a Health Authority (reference number ES-AGEMED-822342241) concerning a 13 year old female patient who on 13-APR-2010 received a dose of GARDASIL (batch number not reported, site of administration not reported) by intramuscular route. Minutes after vaccination, the patient suffered convulsions and syncope. The patient recovered the same day, on 13-APR-2010. Case was reported serious by the Health Authority, with other medically important condition as criteria. Other business partner numbers include: E2010-02898. Case is closed. No further information is available.

MedDRA PT Arrested labour, Caesarean section, Cephalo-pelvic disproportion, Drug exposure during pregnancy, Mastitis, Pyrexia

Symptom Text: Information has been received from a health professional for the Pregnancy Registry for GARDASIL concerning a 26 year old female who on an unspecified date was vaccinated with the first dose of GARDASIL. On 09-SEP-2008 was vaccinated with a second dose of GARDASIL. The patient is pregnant. On 22-OCT-2008, an ultrasound was performed to the patient in order to determine estimated gestational age (EGA) and the results showed, intrauterine pregnancy (IUP) of 8 weeks (LMP was on approximately 27-AUG-2008 and estimated delivery date: 03-JUN-2009). The patient has not had previous pregnancies. In August 2008, a status post colposcopy showed a negative biopsy and negative for herpes simplex 2 (HSV2). Follow up information received from a physician indicated on 21-MAY-2009 at 40 weeks from her last menstrual period the patient gave birth to a normal male, who weighted 8 pounds and 7 ounces; his Apgar score was 8/9. During the labor the patient experienced maternal fever. Follow up information received from a health worker indicated that the patient had a normal pregnancy without complications and that the patient delivered a healthy male without congenital defects. Follow up information indicated that the patient had a C-section on 21-MAY-2009; the physician who delivered the patient's baby indicated that the patient had a "term pregnancy, arrest descent, fetal tachycardia and maternal fever"; it was also confirmed that the patient had cephalopelvic disproportion. It was also reported that on 22-JUN-2009 the patient had a follow appointment with the physician for an incision check and the patient had recovered. On 29-JUN-2009 the patient had a follow up visit with the physician. The patient was diagnosed with mastitis of the left breast. The reporter did not know if the patient recovered from mastitis. The patient had cancelled her follow up appointment scheduled for July 2009. Upon internal review, cesarean section due cephalopelvic disproportion was considered an other important medical event. The baby's experience has

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Cervical dysplasia, Demyelination, Ophthalmoplegia

Symptom Text: Initial information received on 04-MAY-2010 through a company representative and a health care professional, a family planning physician, regarding a 23 year old female who was administered the first dose of GARDASIL (Batch, route and site of administration not reported) on an unspecified date. It was reported that 15 days after vaccination the patient suffered ocular paralysis. A CT scan was performed (date not reported). Some more dense spots were found in white matter. A nuclear magnetic resonance was performed and a demyelination process was detected. The patient was not hospitalized. Medical history: It was notified that two test were performed two years ago and one year ago with normal results (dates not reported). This year (2010) a new PAP smear test was performed, a HSIL was detected (diagnosis date not reported). Also, a cervical conisation was performed (date not reported). Therefore, the physician recommended her to be vaccinated against human papillomavirus. The physician thought that these adverse events were not related with GARDASIL. However, the neurologist who saw the patient thought that there was a connection with the vaccination (this information was provided by the family planning physician). At the time of reporting the patient had not recovered. More clinical test were performing, but at the time of reporting the results were not available. The pharmacovigilance department considered this case as serious with other important medical condition. No further information was reported. Other business partner numbers include E2010-02940.

Other Meds: Unknown

Lab Data: computed axial tomography, ??10, dense spots were found in white matter; magnetic resonance imaging, ??10, demyelination process was detected; Pap test, ??10, a HSIL was detected; Pap test, normal (two PAP were normal)

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Activities of daily living impaired, Chills, Headache, Loss of consciousness, Lumbar puncture, Malaise, Musculoskeletal stiffness, Nausea, Neurological examination normal, Pain, Pyrexia, Viral infection, Vomiting

Symptom Text: This was the 2nd in the HPV series of shots. My daughter had terrible headaches and was throwing up three days after her first vaccine. She never ran a high fever, and missed a week of school. Three weeks to the day after her 2nd shot she began to fill ill. Headache, body ache etc. By the following afternoon she had a stiff neck, the "worst headache she had ever had". We were out of town and she insisted we see a doctor instead of self treat at the hotel. We went to a walk in center where they recorded a low grade fever (101) and because of the stiff neck and headache sent us to the ER for fear of meningitis. My daughter was kept in the ER overnight and given morphine for the pain, had spinal fluid taken, blood tests run etc. She was admitted to the Pediatric Ward where she remained until Tuesday, April 13th. She was tested for Strep Throat, neurological disorders, mono, migranes etc. She was finally released when the doctors felt like we could handle her headache pain with prescriptions and then over the counter medicines. The only thing offered us was it was "viral". The initial doctor in the PED Ward said it was her 3rd case with these symptoms - all coming in looking like meningitis initially - with no conclusions being drawn after a battery of tests. The following information was obtained through follow-up and/or provided by the government. 5/19/2010 PCP ovs 3/18 and 4/14/2010, Dx headache patient with c/o's sudden onset severe headaches, nausea, achiness, chills, passed out am 4/14, seen in ED x 2, neuro exam wnl, neurologist did not think was a migraine, had a LP, labs and dx studies wnl

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Disorientation, Encephalitis, Meningitis viral, Migraine, Vertigo

Symptom Text: Information has been received from a physician via a company rep concerning an approximately 22 year old female with a history of skin lesion who on 22-FEB-2010 was vaccinated with GARDASIL. On 03-MAR-2010 the patient complained of a severe headache/migraine like. On 05 March 2010 she developed vertigo and her mother found her on the floor disorientated. The patient was taken to an emergency room where she was seen by a physician. The patient was admitted to hospital where an uncomplicated viral meningitis/encephalitis was diagnosed. A positive serology for Epstein Barr Virus was found. Her bloods showed an increase in white blood cells with a mild increase in the SSV protein. No other intracranial pathology was seen. She had a Glasgow come scale of 15/15. An EEG showed a possible global cerebral dysfunction. The patient's recovery was uncomplicated, her symptoms were treated. She recovered from the viral meningitis/encephalitis. The reporter felt that the viral meningitis/encephalitis was not related to therapy with GARDASIL. Additional information is not expected.

Other Meds: Unknown

Lab Data: electroencephalography, 05?Mar10, Possible global cerebral dysfunction; Diagnostic laboratory test, 05?Mar10, Positive serum for EPSTEIN BARRE Virus; WBC count, 05?Mar10, Mild increase in SSV protein; Glasgow coma scale, 05Mar10, 15, 15

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Blood pressure decreased, Diarrhoea, Dizziness, Dyskinesia, Fatigue, Headache, Injection site pain, Loss of consciousness, Nausea, Paraesthesia, Pyrexia, Reaction to previous exposure to any vaccine

Symptom Text: Information has been received from a physician, a medical assistant and the patient's mother concerning, a 15 year old female with no medical history or drug reaction/allergies reported who on 19-APR-2010 was vaccinated with a dose of GARDASIL (lot n. 663573/0969Y), 0.5 mg. Concomitant therapy included LOESTRIN. The patient's mother stated that her daughter was given GARDASIL on 19-APR-2010, and this date, she "jerked" within 20 seconds and then she passed out and her blood pressure dropped precipitously. She came to and had nausea and tenderness at the injection site. She started feeling dizzy and had a 102 degree fever for 4 hours. Her extremities started tingling and she had diarrhea on days 3 and 4 following injection, and she had fatigue for first 72 hours. At the time of reporting, the patient still had bouts with dizziness and nausea and she passed out again on 03-MAY-2010. On 04-MAY-2010, the patient experienced headache. Subsequently, the physician stated that the patient received the first dose of GARDASIL and experienced syncope with seizure like movement of the arms and legs about 15 seconds. Physician felt as though it is related to GARDASIL. Later, the medical assistant reported that the patient experienced syncope then, tonic clonic movements. She stated that the physician did not feel this was a seizure (conflicting information with physician's information). The event was not disabling or life threatening and patient did not need to go to the emergency room. Treatment included an antiemetic and increased fluid intake. At the time of reporting the patient was still recovering. Upon internal review syncope with seizure like movement of the arms and legs was considered to be an other important medical event. Additional information has been requested.

Other Meds: LOESTRIN

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Abdominal pain upper, Autonomic nervous system imbalance, Chest pain, Dizziness, Dyspnoea, Fatigue, Nausea, Oropharyngeal pain, Pharyngitis, Syncope

Symptom Text: Information was obtained on a request by the Company from the agency via a Public Case Detail concerning a 14 year old female patient who on 04-APR-2008 was vaccinated with a dose of GARDASIL (lot number not reported). Subsequently the patient experienced fatigue, nausea, dizziness, antonomic instability, fainting, breathlessness, pain in stomach, chest, sore throat and recurrent throat infections. The patient was graded return to activity. At the time of the report, the patient had not yet recovered. The reporter felt that fatigue, dizziness, pharyngitis and syncope were possibly related to GARDASIL. Fatigue, dizziness, pharyngitis and syncope were considered to be disabling. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Cardiac monitoring, Cardio-respiratory arrest, Electrocardiogram, Pallor, Pulse absent, Syncope, Unresponsive to stimuli

Symptom Text: Information was obtained on request by the company from the agency via public case details form concerning a 12 year old female patient who on 15-MAR-2010 was vaccinated with one dose of GARDASIL (Lot # NJ29410 and Batch # NK30260) intramuscularly. It was reported that on 15-MAR-2010, the patient collapsed within 7 minutes of receiving the vaccine. The patient was pale, no carotid pulse and non responsive. The patient was admitted to the hospital and received CPR and intramuscular adrenaline at school, an ECG was performed (results not provided) and cardio respiratory monitoring for 6 hours. The event caused the patient's hospitalization. It was reported that on 15-MAR-2010 the patient recovered from cardio-respiratory arrest. The agency considered that cardio-respiratory arrest was possibly related to vaccination with GARDASIL. Additional information has been requested.

MedDRA PT Diarrhoea, Headache, Rash scarlatiniform, Somnolence, Vertigo, Vomiting

Symptom Text: Information has been received from a Health Authority (case # 116416) (local case #IT218/10) concerning an 11 year old female patient who on 12-APR-2010 was vaccinated with the second dose of GARDASIL (LOT # NJ49370 and Batch # NK44500) intramuscularly. It was also reported that twenty days following the administration of the first dose of vaccine, the patient presented with scarlet fever like exanthema (throat culture negative) and repeated watery vomiting that resolved after infusion therapy within 24 hours. On the same day, 1 hour post-vaccination, she presented with significant somnolence and headache, followed after another 1 hour by 2 vomiting episodes and 2 episodes of diarrhea. The patient was admitted to the hospital. A brain MRI was performed on 15-APR-2010 and was negative, an EEG performed on the same date showed a prevalence of sporadic sharp-waves to the left. The headache, the somnolence and diarrhea resolved on 12-APR-2010 with onset two days post vaccination of vertigo syndrome and persistence of the vomiting episodes (3-5 daily). The health authority coded diarrhea, headache, somnolence, peripheral vertigo unspecified and vomiting. The final outcome was recovered on 17-APR-2010. Other business partner numbers include: E2010-03039. No further information is available. The case was closed.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Asthenia, Condition aggravated, Rash generalised, Syncope, Tremor, Urticaria

Symptom Text: Information has been received from an office manager concerning a 12 year old female patient with no known drug reactions or allergies and no pertinent medical history who on 03-SEP-2009 was vaccinated IM with the first 0.5ml dose of GARDASIL (Lot # 661953/1130X), on 11-JAN-2010, was vaccinated IM with the second 0.5ml dose of GARDASIL (Lot # 663558/0819Y) and on 11-MAY-2010 was vaccinated IM with the third 0.5ml dose of GARDASIL (Lot # 661954/0075Y). It was reported that on 11-MAY-2010, the patient developed hives within 5 to 7 minutes of receiving the third dose of GARDASIL. The patient also experienced a general rash, shakiness, weakness and syncope. The patient was treated with BENADRYL oral, subcutaneous epinephrine and inhaled albuterol. The patient's symptoms improved temporarily then her symptoms became worse. The patient was sent to the emergency room. The patient was not admitted to the hospital. At the time of the report the patient had recovered. The reporter was not admitted to the hospital. At the time of the report the patient had recovered. The reporter stated that since she had 2 other patients (WAES# 1005USA01505 and WAES# 1005USA01536) that experienced an adverse event after administration of GARDASIL with Lot # 661954/0075Y on the same day within 4 hours she was not comfortable using the GARDASIL. There were no laboratory tests performed. The office manager requested a lot check. This is one of several reports received from the same source. A lot check has been initiated. Upon internal review the patient's urticaria and generalized rash, treated with subcutaneous epinephrine were considered to be other important medical events. No further information is available.

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Circumcision, Continuous positive airway pressure, Drug exposure during pregnancy, Intensive care, Neonatal respiratory distress syndrome, Premature baby, Retinal anomaly congenital, Use of accessory respiratory muscles

Symptom Text: Information has been received from a medical assistant concerning one of twin babies. The baby's 18 year old mother was vaccinated with the first and second 0.5 ml doses of GARDASIL by different provider and was vaccinated IM with the third 0.5ml dose of GARDASIL (lot#: 659962/1740U) on 01-DEC-2008. The mother's last menstrual period was 19-NOV-2008 and estimated delivery date was 05-SEP-2009. The medical assistant reported that the baby was born about 1 month early, in approximately August 2009, but as far as she knew, the baby was born normal and healthy. Follow-up information was received from a pediatrician via medical records. The father of baby (FOB) was a twin. It was reported that the pregnancy complicated by premature rupture of membranes (PROM) and preterm labor, breech presentation and a history of mild pregnancy induced hypertension. The mother received one dose of betamethasone at 23:00 of 12-JUL-2009 and was transferred to another hospital on MgSO4. The mother delivered twin babies (one male and one female) via cesarean section for transverse presentation at 13-JUL-2009. The baby boy was born at 02:07 of 13-JUL-2010, 32 2/7 weeks of gestation, weighing 1690 grams. His head circumference was 27.5 cm and birth length was 45 cm. The apgar score is 9 at 1 minutes and 9 at 5 minutes. The baby boy was vigorous at birth, had decreased air entry and was masked continuous positive airway pressure (CPAP) with Neopuff used. It was reported that the boy developed respiratory distress at birth. On 13-JUL-2009, blood gas capillary revealed PCO2 capillary of 54, PO2 capillary of 53, bicarbonate of 25, O2 Sat of 90, capillary total Hgb of 19.8, capillary oxygen Hgb of 88 and capillary CO Hgb of 1. Chest x-ray revealed hazy and no free air. The baby was transferred to NICU for follow up care. Examination on admission revealed mild to moderate retractions presented in the substernal and intercostal areas, consistent with the prematurity of the baby. Active medications included ampicillin, gentamicin, erythromycin, ey

Other Meds: betamethasone; loratadine; magnesium sulfate

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse, for the Pregnancy Registry for GARDASIL, concerning a 21 year old female who on 26-JUN-2007 was received her first dose of GARDASIL, and the second dose on 11-JUN-2009, and just found out she was pregnant again. No information on status of pregnancy or whether she would continue the pregnancy. Follow up information received from a nurse concerning the patient was seen at their Clinic on 26-Jun-2007, and not again until 11-JUN-2009. On 11-JUN-2009 a urine pregnancy test was performed. And it was negative. Follow up information received from a registered nurse concerning the patient electively terminated the pregnancy for personal reasons, not related to the GARDASIL vaccination. Upon internal review abortion induced was considered an other important medical event. The patient had a history of pregnancy while on prior therapy with the 1st dose of GARDASIL (MSD, WAES#0906USA05568). No further information is available.

MedDRA PT Complication of pregnancy, Drug exposure during pregnancy, Foetal disorder, Pre-eclampsia

Symptom Text: Information has been received for the HPV vaccine pregnancy registry from a health professional concerning a 22 year old female patient who received IM the first dose of GARDASIL (batch # NJ0831; lot # 1882U) on 25-MAR-2009 with no adverse effect. The patient was not receiving any concomitant medications. The patient received IM the second dose of GARDASIL (batch # NJ0831; lot # 1882U) on 12-MAY-2009. At the time of receiving the second dose, the patient was pregnant. The last menstrual period date was unknown. At the time of reporting the patient was approximately 12 weeks pregnant. Information has been received from the initial reporter on 06-MAY-2010. The patient received IM the first dose of GARDASIL (batch # NJ0831; lot # 1882U) on 25-MAR-2009 at +/- 6 weeks gestation. The mother received IM the second dose of GARDASIL (batch # NJ08310; lot # 1882U) at +/- 14 weeks gestation. The patient had no medical history or risk factors and was not using recreational drugs or tobacco. The patient had no previous pregnancies. The patient received no diagnostic tests during pregnancy. The patient experienced PET (Pre-eclampsia toxemia) during pregnancy considered as a complication (serious assessment not reported). The case was upgraded serious by the company with OME as seriousness criterion. On 28-SEP-2009 the patient delivered a male baby at 39 weeks of gestation by natural birth and suction with no labour or delivery complications. The outcome for the event of pre-eclampsia toxemia has not been reported. The patient received IM the third dose of GARDASIL (batch # NK31480; lot # NJ28290) on 29-SEP-2009. It has not been reported whether the patient tolerated the dose of GARDASIL. The baby weighed 3.02 Kg and was 54 cm in length with a head circumference of 37 cm and an Apgar score at 1 minute of 10 and at 5 minutes of 10. No malformations or anomalies were diagnosed at birth. The baby had experienced an inguinal hernia repair on an unreported date considered non serious by the reporter. It was not known if the inguinal

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Enterovirus infection, Pancreatitis

Symptom Text: Information was obtained on request by the company from the agency via public case details form concerning a 12 year old female patient who on 17-FEB-2010 was vaccinated IM with a dose of GARDASIL (lot number not reported). On 10-MAR-2010, the patient experienced pancreatitis and was hospitalized; treatment included: gut rest and investigation. The following laboratories were performed: rubella/mumps/ Mycoplasma/EBV were negative; enterovirus serology was positive and could be the cause of pancreatitis; WCC scan (?IBD) was normal; sweat test (?CF) was normal and an repeat ultrasound showed no bilary sludge/pathology. ON an unspecified date, the patient recovered from the event. The reporting agency considered that pancreatitis was possibly related to therapy with GARDASIL. The original reporting source was not provided. No further information is available.

Other Meds: Unknown

Lab Data: Ultrasound, ??Mar?10, No bilary sludge/pathology; EPSTEIN-BARR virus antibodies, ??Mar?10, Negative; Mycoplasma PCR, ??Mar?10, Negative; WBC count, ??Mar?10, normal, scan (?IBD); serum mumps Ab, ??Mar?10, Negative; serum rubella IgG antibod

MedDRA PT Dizziness, Headache, Hypoaesthesia

Symptom Text: An online magazine reported according to a school principal and a physician that six girls with a history of chronic malaria and dysentery (three of six girls) after receiving GARDASIL vaccine were admitted to a hospital complaining of giddiness, headache and numbness. Three of the six girls who were admitted to the hospital were discharged on 05-MAY-2010. It was reported that two of the girls complained of headache on 06-MAY-2010. Meanwhile, two girls also suffered from complications and were admitted to the hospital on 05-MAY-2010. A physician from the hospital said that anxiety, heat and empty stomachs caused the complications. The physician stated that "all girls, who had complications, did not take breakfast and do not bring lunch". But teachers said that, since health officials and teachers had created awareness with students and parents about the vaccine, the girls would not have come to school on empty stomachs. A teacher stated that "it's also compulsory for all students to bring lunch". It was not specified which patients suffered from giddiness, headache and numbness. At the time of the report, the outcome of the patients was unknown. This is one of several reports received from the same source. No further information is available.

MedDRA PT Abasia, Autoimmune disorder, Drug exposure during pregnancy, Gait disturbance, Hypoaesthesia, Infection, Oedema peripheral, Rash erythematous, Scar, Skin burning sensation, Skin lesion, Urticaria, Vasculitis

Symptom Text: Information was obtained on request by the company from the agency via public case details form for the Pregnancy Registry for GARDASIL concerning a 20 year old female with a penicillin, yeast and tomatoes allergies and moderate asthma who on 01-JUN-2008 was vaccinated IM with a first dose of GARDASIL (lot number and site injection not reported). Concomitant therapy included ASMOL and SERETIDE ACCUHALER. It was reported that the patient was eight weeks pregnant at the time of vaccination. On 30-JUN-2008, the patient experienced red spotty rash developing on legs starting around the ankles. With in days it had spread and started to burn and go numb. After a week the patient legs were covered in severe welts and the swelling was so bad she could not walk. After she was admitted to the hospital, some lesions became infected and gangrenous. After wounds healed she was left with significant scarring on her legs. The patient was hospitalized and treated for autoimmune vasculitis. Infected and gangrenous lesions resolved with intravenous antibiotics and steroids (date unspecified). The agency considered that vasculitis was possibly related to therapy with GARDASIL. The original reporting source was not provided. No further information is available.

MedDRA PT Biopsy cervix, Chest pain, Dyspnoea, Urticaria

Symptom Text: Initial and follow-up information has been received from a medical assistant concerning a 23 year old female with prior papilloma viral infection and no known drug allergies who on 27-APR-2010 was vaccinated IM with the first dose of GARDASIL (lot number 665768/1377Y). No other vaccines were administered at the time of the GARDASIL vaccination. At that time, the patient also received Monsel's solution topically to cervical area to stop bleeding, where a biopsy was performed. On 01-MAY-2010 the patient complained of trouble breathing, chest pain and outbreak of hives. The patient was sent to an emergency room (ER, name unknown), where the patient received a cortisone injection. This cortisone treatment was the intervention used to prevent serious criteria. The trouble breathing and chest pains resolved. On 11-MAY-2010, when the office spoke with the patient by phone, the patient was still resolving from the hives. Trouble breathing, chest pain and an outbreak of hives were considered to be other important medical event and disabling by the reporter. The health care professional contacted during telephone follow-up could not supply the following information: hospital name. Additional information has been requested.

MedDRA PT Injection site erythema, Injection site pruritus, Injection site reaction, Injection site swelling, Injection site warmth

Symptom Text: Information has been received from a physician concerning an 18 year old female with allergy induced asthma and allergic to sulpha who on 12-AUG-2009 was vaccinated with second dose of VARIVAX (Merck) (booster) (lot # not reported) intramuscularly. On the same day on 12-AUG-2009 she received third dose of GARDASIL (MSD) (lot #, route and site not reported). Concomitant therapy included meningococcal vaccine (unspecified) administered on 12-AUG-2009. After getting the vaccine she experienced an injection site reaction. The arm swelled up and became warm and red. The patient did not seek medical attention. At the time on the report on 12-AUG-2009 the patient was recovering. There were no laboratories diagnostics studies performed. Follow-up information was received from a physician, who reported that the female student with allergies to sulfa and AUGMENTIN received the second dose of VARIVAX (Merck) subcutaneously into right deltoid. On 12-AUG-2009, the patient developed swollen, red, 1/2 dollar size reaction and itchy. Subsequently the patient recovered. No further information is available.

MedDRA PT Dizziness, Hypersomnia, Injection site erythema, Injection site movement impairment, Injection site warmth, No reaction on previous exposure to drug

Symptom Text: Information has been received from a medical assistant concerning a 11 year old female with no known drug reaction/allergies or pertinent medical history who on 12-AUG-2009 was subcutaneously vaccinated in the right upper arm with her second dose of VARIVAX (Merck) (lot# 664450/0692Y) and had an adverse reaction. The patient was also vaccinated with her second dose of GARDASIL on the same day. The patient did not have any reaction after the first dose of GARDASIL. Post vaccination the patient went home and became dizzy, and light headed, slept for 4 hours. The patient woke up and went to sleep again. The patient's mother took a pen and circled the injection site since it was red, stiff and warm to the touch. Since then the redness had increased outside of the pen mark at the injection site. At the time of the reporter, the patient's events persisted. The patient was being seen by the doctor for followup. Additional information has been requested.

MedDRA PT Apgar score normal, Continuous positive airway pressure, Drug exposure during pregnancy, Intensive care, Laboratory test normal, Premature baby, Respiratory distress, Retinal disorder, Small for dates baby

Symptom Text: Information has been received from a medical assistant concerning one of twin babies. The baby's 18 year old mother was vaccinated with the first and second 0.5 ml dose of GARDASIL by different provider and was vaccinated IM with the third 0.5ml dose of GARDASIL (lot #: 659962/1740U) on 01-DEC-2008. The mother's last menstrual period was 19-NOV-2008 and estimated delivery date was 05-SEP-2009. The medical assistant reported that the baby was born about 1 month early, in approximately August 2009, but as far as she knew, the baby was born normal and healthy. Follow-up information was received from a pediatrician via medical records. It was reported that the mother delivered twin babies (one male and one female) on 13-JUL-2009. The baby girl was born on 13-JUl-2009, 32 2/7 weeks of gestation via C-section for breech position. The baby was transferred to neonatal intensive care unit (NICU) for 18 days, and on continuous positive airway pressure (CPAP) for three days. Active medications included vitamins (unspecified) (POLY-VI-SOL) 0.5 ml PO BID. On 13-AUG-2009, the baby's weight was 5 pounds, 15 ounces, length was 18.5 inch, and head circumference was 13 inch. Her body temperature was 98, pulse was 136, and respiratory rate was 40. Physical examination showed the baby was alert, premature and active. The assessment was the female baby was one month old, premature, was doing well, and breech of birth. The baby continued diet Neosure 22 kcal/ounce and vitamins (unspecified) (POLY-VI-SOL). An ultrasound for hips was scheduled. Barlow and Ortolani tests were negative. The baby would be arranged "for syringes, monthly injection". On 04-SEP-2009, the baby had hip click alignment check. Ultrasound infant hips with physician guided was performed which showed both hips were within normal limits. The mother's experience has been captured in WAES # 0904USA01164. The twin baby's experience has been captured in WAES # 0904USA01164B2. Additional information has been requested. All available medical records will be provided upon r

Other Meds: betamethasone; loratadine

Lab Data: Ultrasound, 09/04/09, hip click alignment check: both hips were within normal limits ```Labs and DX studies: CXR normal with no abnormality. U/S of head normal.

MedDRA PT Abdominal pain upper, Activities of daily living impaired, Fatigue, Gait disturbance, Headache, Menstruation delayed, Muscular weakness, Nausea, Vaccine positive rechallenge, Walking aid user

Symptom Text: Information was obtained on a request by the Company from the agency via a Public Case Detail form concerning a 14 year old female patient with no psychiatric history and no family history of MS (multiple sclerosis) who was vaccinated with three doses of GARDASIL, started on 21-MAY-2008 (lot# 658278/0900U) and stopped on 15-OCT-2008. Subsequently the patient experienced stomach pain after each vaccine. On 21-MAY-2008 the patient experienced constant nausea, severe headaches and chronic fatigues. In November 2009 the patient lost use of her legs, she was using a walking stick. The patient had not been to school for a year and at the time of the report she was only taking a couple of classes per week. On an unknown date the patient was hospitalized. She was treated with VOLTAREN. At the time of the report, symptoms persisted. It was reported that menstruations halted not to return until February 2009 (not specified). Blood test, CT scans, X-rays and laparoscopy were performed, with no abnormality detected (NAD). The agency considered that abdominal upper pain, fatigue, headache, muscular weakness and nausea were possibly related to vaccination with GARDASIL. The original reporting source was not provided. No further information is available.

Other Meds: Unknown

MedDRA PT Activities of daily living impaired, Arthralgia, Cough, Fatigue, Hypersomnia, Hypoaesthesia, Increased tendency to bruise, Migraine, Muscular weakness, Musculoskeletal stiffness, Myalgia, Nasal congestion, Nausea, Neurological examination normal, Oropharyngeal pain, Paralysis, Pyrexia, Tremor, Upper respiratory tract infection, Vision blurred, Vomiting

Symptom Text: Information has been received from a female consumer concerning her 12 year old daughter with allergic reaction to antibiotics (amoxicillin) and no pertinent medical history reported who received the first dose of GARDASIL vaccine "3 years ago", in approximately April 2007. It was reported that the patient had all three doses of GARDASIL vaccine (dates not specified). According to the reporter "2 and a half years ago", on approximately November 2007, the patient experienced temporary paralysis from the waist down, migraines for three months straight that progressively got worse. She was tired all the time and went from an active person to someone who could barely get out of bed. The patient also bruised easily, was shaky, sometimes had no feeling in her arms and legs and had high fevers. The consumer stated that the doctors said that "it was all in the patient's head". The patient was going to see a neurologist, possibly in July 2010. The patient sought unspecified medical attention. At the time of the report the patient had not recovered. No diagnostic tests were performed. Upon internal review temporary paralysis from the waist down was determined to be another important medical event. The health care professional contacted during telephone follow-up could not supply the following information: dates of vaccination, lot numbers, dates of events. Additional information has been requested. The following information was obtained through follow-up and/or provided by the government. 5/27 and 5/28/2010 MR for PCP ovs 4/15/2009-5/19/2010, Dx Chronic fatigue, Migraines, URI patient with c/o's arthralgias, myalgias. am stiffness, fatigue, exhaustion, unable to perform at school ,hypersomnolence, had a complete rheumatology w/up, lab studies were negative, but sx continued, somatic c/o's thought to be due to anxiety/depression, placed on Zoloft, then developed severe headaches with nausea/vomiting, blurred vision, weakness LLE, neuro exam wnl, dx'd as migraines, also c/o's sore throat, nasal congestion, cough and fever

MedDRA PT Bacterial infection, Nasopharyngitis, Peritonsillitis, Pyrexia, Tonsillitis, Vaccine positive rechallenge

Symptom Text: Information has been received from a Health Authority (HA ref. 101689) concerning a 14-year-old girl who was vaccinated with GARDASIL (unknown route, 0.5 ml) on 24-JUL-2009 (first dose, batch number NJ11570, lot # 1864U, on 18-SEP-2009 (second dose, batch number NK02480, lot # 0719X) and on 26-MAR-2010 (third dose, batch number NL30760, lot# 1334X). HA reported all three doses as suspected and positive rechallenge. HA coded bacterial infection (causality possible) with first time onset on 30-JUL-2009, six days following vaccination with the first dose. Stated in the report: "Previously health girl who following vaccination with GARDASIL developed symptoms of infection, peritonsillitis and tonsillitis." On 30-JUL-2009, six days post following administration of the first dose, the girl developed peritonsillitis and received treatment at the hospital (no details reported). On 22-SEP-2009, four days following vaccination with the second dose, the girl developed tonsillitis. On 31-MAR-2010, five days after vaccination with the third dose, the girl experienced common cold and fever. The outcome was recovered without sequale. No further information was available at the time of reporting. Case is closed. Other business partner numbers include E2010-03043.

Seriousness: LIFE THREATENING, SERIOUS

MedDRA PT Abdominal pain upper, Chest pain, Dyspnoea, Electrocardiogram T wave inversion, Fatigue, Infectious mononucleosis, Influenza like illness, Menorrhagia, Nausea, Palpitations, Pericarditis, Vomiting

Symptom Text: Patient received dose #1 GARDASIL on 10/29/9 - mother stated pt had flu-like s/s for 2 days post injection, did not report such to our office until after 2nd immuz. On 12/29/2009 received 2nd GARDASIL injection (diagnosed with mononucleosis on 12/4/2009), developed CP, SOB, nausea, vomiting on 2/5/10. Seen by Dr (cardiologist) dx with pericarditis, placed on ibuprofen 800 mg PO TID and taken out of sports, spoke to mother on 2/10/10 - Patient better, mother convinced recurrent s/s related to adverse effect from #2 GARDASIL. The following information was obtained through follow-up and/or provided by the government. 06/01/09. PCP notes for 12/04/09, 02/05/10. Pt c/o of continuing stomach aches, fatigue, SOB, nausea, vomiting, chest pain. DX mononucleosis. 06/09/10. Cardiology consult for DOS 02/01/10. Pt c/o chest pain, dyspnea and palpitations. Pt reported R parasternal cheskt pain with no radiation. EKG findings suggested pericarditis, nonspecific T wave inversion. Tx: Ibuprofen. Echocardiogram confirmed acute idiopathic pericarditis. Assessment: chest pain, dyspnea, palpitations, probable pleural pericarditis. F/U visit on 02/05/10, Pt c/o dyspnea, some chest pain. Assessment: pericarditis. On 02/25/10, Pt's symptoms had resolved, but Pt had menorrhagia.

Other Meds: YAZ; DORYX; DIFFERIN; BENZACLIN

Lab Data: None in our office The following information was obtained through follow-up and/or provided by the government. Labs and DX studies: ECG and Echocardiogram abnormal. BNP normal. Mono test positive.

History: NKDA The following information was obtained through follow-up and/or provided by the government. PMH: URI, SOB, estrogen tx for menorrhagia, appendectomy in 2007. Allergies none.

MedDRA PT Activities of daily living impaired, Chest pain, Condition aggravated, Dyspnoea, Infectious mononucleosis, Influenza like illness, Nausea, Pericarditis, Vomiting

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 15 year old female patient with no known drug allergies was vaccinated with the first dose of GARDASIL on 29-OCT-2009. Concomitant medications included YAZ, DORYX, DIFFERIN and BENZACLIN. The patient's mother reported that the patient had flu-like signs/symptoms for 2 days post injection, it was not reported to the physician's office until after the second dose of GARDASIL (Lot # 661758/0968Y) was administered on 29-DEC-2009, into the patient's right arm. On 04-DEC-2009, the patient was diagnosed with mononucleosis, the patient developed CP (chest pain), SOB (shortness of breath), nausea and vomiting on 25-FEB-2010. The patient was seen by a doctor (cardiologist) with a diagnosis of pericarditis, she was placed on therapy with ibuprofen 800 mg, PO TID and was taken out of sports. The office spoke to the mother on 10-FEB-2010 and the patient was doing better, the mother was convinced that the recurrent signs/symptoms were related to adverse effects from the second dose of GARDASIL. No laboratory data was available in the office. The original reporting source was not provided. The VAERS ID # 388480. The listing indicated that one or more of the events was considered to be immediately life-threatening. A lot check has been initiated. A standard lot check investigation has been finalized. All in-process quality checks for the lot number 661758/0968Y were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the Center for Biologics Evaluation and Research and was released. No further information is available.

MedDRA PT Vaccination complication

Symptom Text: An online magazine reported according to a school principal and a physician that a girl who on an unknown date was vaccinated with a dose of GARDASIL suffered from complication and was admitted to the hospital. A physician from the hospital said that anxiety, heat and empty stomachs caused the complications. The physician stated, referring to other girls who experienced symptoms with GARDASIL, that "all the girls, who had complications, did not take breakfast and do not bring lunch". But teachers said that, since health officials and teachers had created awareness with students and parents about the vaccine, the girls would not have come to school on empty stomachs. A teacher stated that "it's also compulsory for all students to bring lunch". At the time of the report, the outcome of the patient was unknown. This is one of several reports received from the same source. No further information is available.

MedDRA PT Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse practitioner for GARDASIL, a Pregnancy Registry product, concerning a 24 years old female with no drug allergies and no pertinent medical history who on 06-NOV-2008 was vaccinated with the first dose of GARDASIL (lot number unknown). On 23-JAN-2009 the patient was vaccinated with the second dose of GARDASIL (lot number 661703/0651X). On 12-JUN-2009 the patient was vaccinated with the third dose of GARDASIL (lot number 661703/0651X). The patient became pregnant around the time of the 3rd dose GARDASIL. Pregnancy is normal to date. The patient's LMP was reported as 24-MAY-2009. The estimated delivered date would be on 28-FEB-2010. Follow-up information was received from the consumer via a completed outcome pregnancy questionnaire. It was reported that the patient did not have any previous pregnancies, pre-term deliveries, spontaneous abortions, elective terminations or fetal deaths. The estimated conception date was 11-MAY-2009. On 16-FEB-2010, the patient delivered a normal female baby with no congenital anomalies weighing 8 pounds, 7 ounces, length 20 inches. The patient had no complication and no infections or illnesses during pregnancy. It was reported that the baby was stuck, so the patient had to have a C-section. The patient had no concurrent medical conditions. Upon internal review, C-Section was determined to be an other important medical event. Subsequently, the baby experienced heart murmur. The baby's experience was captured in WAES#0907USA01322B1. Additional information has been requested.

MedDRA PT Abortion induced, Drug exposure before pregnancy

Symptom Text: Information has been received from a registered nurse, for the pregnancy registry for GARDASIL, concerning a 15 year old female patient who on 28-APR-2010 was vaccinated with the first dose of GARDASIL (dose and route not reported; lot number 663573/0969Y). Nurse reported that the patient became pregnant after receiving GARDASIL approximately 15-MAR-2010 and she had 9 weeks of gestation at the time of the report (EDD: 20-DEC-2010 approx.). Therapy with the vaccine was discontinued and it was not reintroduced. The patient sought unspecified medical attention. Follow up information has been received from the health care provider who reported that the 15 year old female on 27-MAY-2010 had an elective termination of her pregnancy. The patient does not want to participate in the pregnancy registry for GARDASIL. Upon internal review, abortion was considered to be an other important medical event. Additional information is not expected.

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Arthralgia, Laboratory test normal, Neck pain, Tenderness

Symptom Text: Information has been received from a physician concerning a 16 year old female with acne, migraine, dysmenorrhea, mid cycle pain and oxycodone allergy (it was for a broken bone sustained in an athletic incident, much prior to receiving GARDASIL) who on 08-JUL-2009 was vaccinated IM with the first dose of GARDASIL (lot# 661954/1131X). Concomitant therapy included MENACTRA and minocycline. On 14-JUL-2009 the patient began to complain of neck pain and joint pain. Neck pain and joint pain happened twice in the week following the vaccination. On 17-JUL-2009, she went to her pediatrician, who noted that there was no joint swelling, redness, nor heat. On 10-AUG-2009, she went to a pediatric rheumatologist, who stopped the minocycline (for acne), and gave an anti-inflammatory for the neck pain and joint pain. Lab and diagnostic studies were normal. She recovered during the winter of 2009 (approximately December 2009). Neck pain and joint pain were considered to be other important medical events by the rheumatologist. Neck pain and joint pain were considered to be disabling since the patient couldn't go to school. No further information is available. The following information was obtained through follow-up and/or provided by the government. 05/28/10. PCP notes for DOS 07/08/09. DX Pt for well visit. On 07/17/09, Pt c/o neck pain, joint pain. On exam neck was painful, but not stiff. Impression: arthralgia (etiology uncertain). Tx: antiinflammatories. 06/03/10. Rheumatology visit for 08/10/09. Pt c/o HA and neck pain. On exam: Pt had pain on flexion and extension and tenderness in neck, shoulders, BLE and ULE. Assessment: polyarthria likely due to minocycline. Pt stopped minocycline and started Relafen.

Other Meds: Minocycline

Lab Data: Unknown

History: Broken bones; Accident The following information was obtained through follow-up and/or provided by the government. PMH: dysmenorrhea, midcycle pain, migraine HA, viral meningitis. Allergies: Oxycodone.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Electroencephalogram abnormal, Syncope

Symptom Text: I saw patient on 5/06/09 - Thin with history of fainting spells, near "black outs" that started summer '08. Start near time of 2nd HPV. Symptoms worsen from 3/09-5/6/09. Multiple labs, EKG, cardiology eval was done. EEG 8/4/09 was abnormal. Placed on Keppra 750 mg BID. Followed by neurology. Follow up - Please note - the exact "onset date" can not be determined. You may wish to contact the mother of patient for more details; she stated that she was available for questions. Pt received her first HPV on April 15, 2008, along with Tdap, MCV4, and Hep A. On June 17, 2008, pt mentioned that she had almost fainted the previous week, and that she had been having episodes of "near-fainting" approximately once per week since her second HPV. She stated at that time that she never falls to the floor but feels that if she does not hold herself, she would probably fall. No exact date as to when first episode occurred except to say that it started around the time of the second HPV. I told mom to keep calendar of these near-fainting episodes (I felt at that time that the patient's diet was a possible cause). Pt received her third HPV that day. On October 29, 2008, I saw pt for a sport physical. Mom felt that the near-fainting episodes were better and may have resolved. She did mention that after the third HPV, that her daughter was a "little fainty". On May 06, 2009, pt came in because for the last 2 months the near-fainting spells were now daily. Mom stated that in the fall of 2008, near-fainting episodes were few and far between but now were almost daily. labaoratory workup and EKG were done. She was referred to a cardiologist, and to a neurologist. Pt saw a neurologist on July 10, 2010, and attributed her near-syncopal episodes to dehydration. On August 04, 2009, pt had an abnormal EEG. As a result of the abnormal EEG, pt was started on KEPPRA, an anticonvulsant. On follow-up visit witht the neurologist on October 22, 2009, her near-syncopal episodes resolved with KEPPRA. Patient's last name corrected.

Other Meds: Albuterol MDI for Asthma

Lab Data: Abnormal EEG on 08/04/2009.

History: Mild intermittent asthma

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abdominal pain upper, Anaemia, Dizziness, Loss of consciousness, Urinary incontinence

Symptom Text: Pt was given 2 shots on 4/15/10. One was varicella and one was HPV. Immediately after vaccination the pt got lightheaded so we sat her on the floor with head down and feet up until she felt better. She returned back to class that day. The next day (4/16/10) as she was in the lunch line at school her stomach began to hurt and she got dizzy. She went to tell her line teacher. As she got to her and began to tell her she wasn't feeling good she went down and the teacher caught her. She doesn't remember after that. She passed out and peed her pants. Her grandmother and mother were called in and she was taken to the Dr. where lab work was ordered. The found that she was anemic. All lab results will be with VAERS form. Description of incident per RN administrator of vaccine and per pt mother per phone call.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Dizziness, Headache, Hypersensitivity, Insomnia, Lip swelling, Swelling face

Symptom Text: Initial and follow-up information has been received from a physician and licensed practitioner nurse (office manager) concerning a 15 year old male patient with no pertinent medical history, concurrent conditions, or drug allergies who on 14-MAY-2010 was vaccinated with the first dose of GARDASIL (lot# 663559/1178Y). There were no concomitant vaccines or therapy. The physician stated that on 14-MAY-2010 the patient experienced facial swelling, similar to Stevens-Johnson syndromes but without the skin reaction, after his first vaccination with GARDASIL. The patient was seen in the Emergency Room where he received IV Benadryl and IV steroids and a MEDROL dose pack for home. The patient was not admitted to the hospital. The physician reported that the patient also had dizziness, headache and insomnia. The office manager reported that the patient had followed-up at the office on 19-MAY-2010. The patient still not totally recovered, but was doing better. The manager confirmed that the event was not Stevens-Johnson syndrome. The event was not considered disabling or life threatening by the office manager. The office was unsure if the next dose in the GARDASIL series would be given. "Facial swelling, dizziness, headache and insomnia" were considered to be other important medical events by the physician. Additional information has been requested. The following information was obtained through follow-up and/or provided by the government. 5/26/10 MR received for dates 5/18/10 to 5/19/10 CC: f/u ER visit for reaction to vax. Pt has facial swelling. OV 5/19/10 f/u allergic reaction. CC: dizziness, HA, vertigo. Diag/Labs: abs neutrophils 12784(H), CRP 1.1(H). 6/3/10 Hospital record received for date 5/15/10 DX: allergic reaction. CC: lip swelling after vax this day. Assessment: swelling of lips only. IV treatment given pt stable at dc.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Aggression, Dizziness, Grand mal convulsion, Headache, Loss of consciousness, Postictal state, Tongue biting, Tremor, Unresponsive to stimuli

Symptom Text: PATIENT SUFFERED A GRAND MAL SEIZURE AT SCHOOL. HIS SISTER ALSO RECEIVED THE VACCINE (VAERS ID 383436) AND HAD GRAND MAL SEIZURE ON 03/17/2010. SISTER'S SEIZURE WAS 85 DAYS AFTER HER FIRST SHOT, PATIENT'S WAS 83 DAYS AFTER HIS FIRST SHOT. The following information was obtained through follow-up and/or provided by the government. 06/09/10. Neurology consult for DOS 05/21/10. Pt was seen after experiencing 1 seizure episode. Seizure was preceded by possible auditory hallucinations, unresponsiveness, unconsciousness and shaking. Pt had HA, dizziness. Assessments: seizures. Pt scheduled for f/u appointment and MRI. 06/30/10. ER report for 05/20/10. Pt p/w seizure, lightheadedness, HA. DX: possible sz. Pt discharged with a f/u appointment with neurologist. On 06/02/10, Pt had another ER visit after having a second episode of tonic-clonic seizure. Pt was postictal and bit tongue. Impression: recurrent seizures with no recent finding or intracranial bleed or mass or metabolic reason. Pt experienced 2 other seizure episodes while in ER. Tx: Ativan, Kepra. Pt was also combative after the seizure. Pt stabilized. Pt discharged home and to follow up with a neurologist. 08/03/10. Radiology exam on 05/25/10. Pt underwent brain MRI after the new onset of seizures. Impression: very small subcentimenter focal area of high signal in R posterior parietal deep white matter with nonspecific focal area edema, demyelination, no mass. Radiologist considered this finding could be related to h/o new onset seizures, however it could also be incidental finding.

Other Meds:

Lab Data: EEG, CAT SCAN, BLOOD WORK-ALL NORMAL; STILL WAITING ON MRI RESULTS. The following information was obtained through follow-up and/or provided by the government. DX studies: EEG normal. MRI of brain abnormal.

History: NO The following information was obtained through follow-up and/or provided by the government. PMH: none. Allergies: Ibuprofen, Gardasil.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Caesarean section, Cervix oedema, Complication of pregnancy, Drug exposure during pregnancy

Symptom Text: Information has been received from a consumer for the GARDASIL vaccine pregnancy registry concerning a 26 year old female patient who was vaccinated with the third dose of GARDASIL (batch # not reported) via intramuscular route on 23-JUL-2009. The day following vaccination the patient found out that she was pregnant. Her latest menstrual period dated back to 18-JUN-2009. No reaction was reported. Follow up information has been received on 10-FEB-2010: The patient was contacted by phone and had informed that everything was ok, currently the pregnancy was on the 34 week without any clinical incidents. The delivery was scheduled for nineteenth or twentieth of March. Follow up information received from a consumer on 14-MAY-2010: The patient was contacted by phone with success. The patient gave birth to a male baby on 17-FEB-2010 (35th week). It was the first pregnancy of the patient. The physician decided to conduct a caesarean because the baby was too much fit in and the mother had developed a cervical oedema. The baby apgar 10/10, both the baby and the mother were well. No more information is expected. File is closed. The event was reported as other medically significant condition. Other business partner numbers include: E2009-07879. No further information is available.

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Asthenia, Back pain, Condition aggravated, Depression, Dizziness, Dyspnoea, Educational problem, Hypersensitivity, Musculoskeletal stiffness, Nausea, Neck pain, Neurological symptom, Pallor, Weight increased

Symptom Text: Before I received the shot, I was a normal, healthy and very active teenager and an excellent student. After the shot, everything changed. My former gynecologist gave me the shot and when I came back 3 days later to tell her what had happened (I'll explain after this), she denied giving me the shot and basically said that there was nothing she could do to help me. I had a severe allergic reaction a few hours after the first shot. I had severe nausea, severe dizziness, and severe shortness of breath. I also was extremely pale and thought that and felt like I was going to pass out. I was taken to the emergency room by my mother and they determined that it was a severe allergic reaction to the shot and suggested to me not to get the second or third shot, which I never did. The following day, I woke up with severe pain and stiffness throughout my whole body, where it was most severe in my entire neck and my entire back. I had never ever had pain this severe in my life until the day after I got the shot and I believe that they are related. I have had the severe pain ever since. It has completely and negatively affected my entire life. I was no longer able to be active, I gained weight, and my grades dropped dramatically. It has also affected my depression at some points and makes it worse sometimes, when before the medication that I am on, worked all of the time, until I had this severe neck and back pain, which at times, has made my depression worse. I am still having a lot of trouble with all of this horrific pain. It has completely debilitated me and I am at a loss for what to do next, because I have tried almost everything in the book, minus surgery. The following information was obtained through follow-up and/or provided by the government. PCP medical records received 6/22/10. Service dates 1/3/2008 to 7/15/08. Assessment: Neurological symptoms. Patient had appointment for refills of oral contraceptive rx. She is having neurological symptoms since first gardasil vaccine on 1/3/08.

Other Meds: -Lexapro 20mg/day -Clonopin .5mg as needed for anxiety -Hydrocodone/APAP 10mg/325mg 1 every 8hours -Lyrica 200mg 3 times a day -Maxalt 10mg 1-2 as needed for migraines -Vyvanse 50mg 1/day for concentration

Lab Data:

History: same as listed above in the beginning of my statement. (Depression [before the shot], and allergies- hay fever in the spring [like grass/tree pollen, etc... and cats).

Prex Illness: I was diagnosed with clinical depression in December/January of 2002/2003. That is the only illness that I was diagnosed with, w

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abdominal pain, Decreased appetite, Dizziness, Duodenal ulcer, Dyspepsia, Headache, Inflammation, Myalgia, Nausea, Pain

Symptom Text: Information has been received from a physician concerning a female who developed "duodenal ulcer" after receiving GARDASIL (lot # not available). The patient had spoken to physician. At the time of the report, the patient's status was unknown. Follow up information received from a physician concerning a 14 year old female with urinary tract infection. Exercise-induced asthma and no known drug allergies, who on 08-SEP-2009 was vaccinated with a dose of GARDASIL (lot # 662404/0312Y, IM) in the left arm at 2:15 p.m. Concomitant therapy included BACTRIM started on 08-SEP-2009 after GARDASIL vaccine was given for urinary tract infection. On 08-SEP-2009 the patient experienced nausea, myalgia, headache, dizziness lasting 6-8 weeks (especially the nausea), the patient was treated with zofran, ranitiding without relief. The patient was seen by gastroenterologist and had EGD done on 15-OCT-2009 which showed duodenal ulcer. Currently she continued to have nausea, headache despite being on NEXIUM. It was reported on 28-SEP-2009 from a medical record that she was in her normal state of health until three and a half weeks ago. Within hours of receiving GARDASIL, the patient began to have abdominal pain, nausea, dizziness, headaches, and body aches. The problems with abdominal pain and nausea had been constant for the past three and a half weeks. The patient stated that the nausea was constant, but she had had no vomiting. Her appetite had also been significantly less, she denies vertigo. The patient stated that her abdominal pain was worse after eating. She tried ZANTAC, which did not help with her pain or nausea. ZANTAC made her more dizzy. The patient also had persisting intermittent headaches and dizziness. Her body aches had resolved. The patient reported that her stools were soft and daily. She denied any history of constipation. Current medications included ALBUTEROL as needed. The patient would undergo a colon clean-out, start daily stool softener therapy, bowel retraining, and increased dietary fiber. For her colon cl

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Convulsion, Crying, Cyanosis, Loss of consciousness, Malaise, Muscle tightness, Musculoskeletal stiffness, Presyncope, Surgery, Syncope, Unresponsive to stimuli, Urinary incontinence

Symptom Text: Information has been received from a physician and a registered nurse concerning an eighteen year old female patient who on 12-MAY-2010, 18-JUL-2008 and 20-MAY-2010 was vaccinated with the first, second and third doses of GARDASIL (Lot # 659962/1740U, Lot # 659182/1757U and Lot # 663451/0216Y 0.5 ML, respectively) into the right arm. On 20-MAY-2010, the patient also received a dose of ADACEL (Lot # UF486DA) into the left arm. About 5 minutes after the third dose of GARDASIL had been administered, the patient sat down in the waiting room. The patient developed a "little" seizure. The nurse reported that the patient lost consciousness, became stiff in the legs and had clinched hands. The patient had cyanosis and was incontinent of urine. The registered nurse was not sure how long the seizure had lasted. The patient regained consciousness and recovered. The patient's mother stated that on the evening of 20-MAY-2010 the patient had seemed a little "off" (not specified). The patient was referred to two different Neurologist physicians but the patient's mother had stated that the patient had not made an appointment with either Neurologist at that time. The patient was also advised to contact the Pediatric Cardiologist office to schedule an electrocardiogram ECG. On 24-MAY-2010, the registered nurse stated that the patient's mother was contacted via a telephone call. The patient's mother stated that the patient was "doing fine". On 25-MAY-2010, the nurse stated that the patient's father had told the physician that the patient had surgery in 2009. The patient received IV therapy and passed out. The patient's father thought that at that time the patient had a seizure. Upon internal review, seizure was considered to be an other important medical event. Additional information has been requested. The following information was obtained through follow-up and/or provided by the government. 06/03/10. PCP visit on 05/20/10. Pt had syncopal episode after immunization, arching, urinary incontinence, unresponsive, crying, seizure,

MedDRA PT Dysaesthesia, Headache, Nausea, Vision blurred

Symptom Text: Case received from health care professional. A pediatrician reported that a 20-year-old female patient was vaccinated with a first dose of GARDASIL (lot # 1400U, batch # NH38510) IM into the left upper arm and concomitantly with a third dose of ENCEPUR (lot # 106021A) IM into the right upper arm on 22-APR-2010. On 01-MAY-2010 the patient developed headache and dysaesthesia in the hairy area of the head. On 04-MAY-2010 she additionally experienced nausea and on 07-MAY-2010 she had blurred vision. For further investigations the patient was admitted to hospital for an unspecified time. The patient recovered from blurred vision after one day and from the other symptoms on 11-MAY-2010. Previous vaccinations with ENCEPUR on 08-MAY-2009 first dose and on 18-JUN-2009 second dose were well tolerated. Other business partner numbers included E2010-03226. No further information is available. Case closed.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Acute disseminated encephalomyelitis, Demyelination, Grip strength decreased, Injection site pain, Monoparesis, Multiple sclerosis, Spinal cord disorder

Symptom Text: Information has been received from a Neurologist (reference number TMI-2010-200) and a pharmacist concerning an 18 year old female patient who 3 weeks before 20-MAY-2010, was vaccinated with the first dose of GARDASIL (intramuscular in left deltoid). Three weeks before vaccination, in April 2010, the patient had experienced Paraesthesia in the right thigh which lasted for about 15 days. The patient consulted a general practitioner which was not worried about it. The patient was asymptomatic for about ten days before vaccination. After the administration of the vaccine, the patient experienced pain at the injection site and 2 days later a very slight paresis of the upper left limb appeared: the patient now needed 2 hands to press a shampoo bottle. The general practitioner was consulted and again he was not worried. Her mother, a neurology nurse, was worried and consulted a neurologist who diagnosed a demyelination disease: -acute disseminated encephalomyelitis (but 2 episodes) or -multiple sclerosis (lesion at corpus callosum specific to multiple sclerosis + cervical spinal lesion). The neurologist stated that, in her opinion the disease had started before the administration of the first dose of GARDASIL. The patient has a twin sister. The sister received the first dose of GARDASIL 14 days later than the patient and did not present any symptoms. No other relevant personal or family history. The case was upgraded to serious as it concerns a medically important condition. Other business partner numbers include E2010-03270. No further information is available.

MedDRA PT Joint swelling, Lip swelling, Oedema peripheral, Reaction to previous exposure to any vaccine

Symptom Text: Information has been received from a licensed practical nurse concerning an 18 year old female patient with red dye and penicillin allergy who on 17-MAR-2010 and 19-MAY-2010 was vaccinated with a first and second dose of GARDASIL (Lot # 662724/0313Y for both doses), 0.5 mL, IM. Concomitant therapy included LOESTRIN 24 FE. The nurse reported that on 20-MAY-2010 the patient had experienced swollen bottom lip, heel, hip, and wrist after receiving the second dose of GARDASIL. She had been taking BENADRYL. The patient called the office. At the time of this report, the patient was recovering. The licensed practical nurse considered "swollen bottom lip, heel, hip, and wrist" to be other important medical events. It was also stated that the patient had similar reaction when she was little with an unknown medication. Additional information has been requested.

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Bronchospasm, Cognitive disorder, Fatigue, Hypersensitivity, Infection susceptibility increased

Symptom Text: Information has been received from a physician concerning a 19 year old female who in July 2009 and December 2009, was vaccinated with the first and second doses of GARDASIL, respectively. The patient experienced one week of feeling exhausted and brain fog after receiving her first dose of vaccine. She experienced severe brain fog and profound fatigue after the second dose. She was not able to attend spring semester of college as a result. Prior to receiving GARDASIL she was an athlete who excelled at track and excelled as a student and did not have an allergy to citrates prior to receiving GARDASIL. The patient was also experiencing a severe hypersensitivity to citrates and seemed to be more prone to Streptococcus infections. The physician also reported the patient just recently experienced intense bronchospasm for 1 hour after taking a lactobacillus mixture. It was discovered after the patient's reaction that the mixture contained an extremely small amount of citrate. At the time of report the patient had not recovered. No further information is available.

MedDRA PT Abasia, Areflexia, Arthritis reactive

Symptom Text: Information was obtained on a request by the Company from the agency via a public case details form concerning an 11 year old female who on 22-MAR-2010 was vaccinated with a dose of GARDASIL. Secondary suspect therapy on 22-MAR-2010 included RECOMBIVAX HB (manufacturer unknown) by intramuscular route. On 23-MAR-2010 the patient experienced severe progressive reactive arthritis with loss of ability to walk and loss of ankle reflexes. The patient was admitted to hospital on 29-MAR-2010. The hands, elbows/knees and ankles were affected. The patient was treated with antiinflammatories. At the time of the report, the patient had not yet recovered. The agency considered that the events were possibly related to therapy with GARDASIL and RECOMBIVAX HB. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Activities of daily living impaired, Laboratory test, No reaction on previous exposure to drug, Urticaria

Symptom Text: Case received via a sales representative from a health care professional (GP) : A female had received the second or third dose of GARDASIL and experienced several flares of urticaria. Follow up information received from the same GP: Case upgraded to serious (other important event: use of intramuscular corticosteroids). A 29 year old female patient had received the third dose of GARDASIL (batch# NJ31210, lot# 1202U) in the left deltoid via intramuscular route on 12-JAN-2010. Starting 18 days after the vaccination and for a period of 2 months (i.e. from 30-JAN-2010 till 30-MAR-2010), the patient experienced several flares of urticaria. The patient had received a first dose of GARDASIL (batch# NJ31210, lot# 1202U) on 04-JUN-2009 and a second dose of GARDASIL (batch# NJ31210, lot# 1202U) on 19-AUG-2009. All doses were administered in the left deltoid via intramuscular route. The patient had no allergy, no medical history or risk factor, had not used medication in the month preceding the vaccination and had no adverse effect with previous vaccinations. The father had eczema. Vaccines had not been mixed with others in one syringe. A lab test was done but no result provided. The event was treated with antihistaminics and oral and intramuscular corticosteroids. The reporter did not tick any seriousness criteria but added a question mark under the word "serious" and added the comment" important urticaria"-work incapacity. The patient recovered. Other business partner numbers included: E2010-02605. No further information is available.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Asthenia, Blood test normal, Conduction disorder, Demyelination, Feeling abnormal, Iron deficiency, Myelitis, Neuropathy peripheral, Paraesthesia, Rheumatoid factor negative, Sensory disturbance, Skin warm, Spinal cord injury thoracic, Tenderness

Symptom Text: Information has been received from a health authority (HA referenced number PEI2010014461) concerning a 16 year old female who on 15-MAR-2010 was vaccinated intramuscularly (site not reported) with third dose of GARDASIL (lot number 1316U, batch number NH3490). In the beginning of April 2010 (about two weeks before hospitalization), the patient developed tingling of her right toes spreading "stocking live" up to the right hip. On 25-APR-2010, the patient additionally developed "sensory disturbances" of the left toes and was admitted to the hospital. She reported that she had been more asthenic and less resilient recently. During clinical examination, she was tender to touch (in the area of tingling). Several investigations including electroencephalogram, MRI (cranial, cervical spine), visual evoked potential (VEP), ophthalmological examination and sonography of kidney and urinary tract showed normal results. The MRI of thoracic and lumbar spine showed an increased signal/lesion at the level of Th10. A focal myelitic event was suspected. The somatosensory evoked response (SEP) revealed a peripheral conduction disturbance in the right tibialis nerve. Blood count showed signs of iron deficiency and for the rest, normal values. Other laboratory tests revealed a decreased in ferritin (2ng/mL). CSF, proteins in serum and CSD were within normal limits. Oligoclonal bands in CSF were negative. Rheumatism serology revealed: anti-streptolysin of 406 U/mL. All other values were negative or normal. Neurotropic pathogens were negative in serum and CSF, except for cytomegalovirus antibodies IGg in serum 1:16T, CMV antibodies IgM in serum were borderline, rubella IgG in serum of 93, rubella antibodies (HHT) new 1:128. After a cortisone massive-dose therapy for five days, the symptoms improved and the physicians did not expect a CMV infection of rheumatic disease. Final diagnosis of acute thoracic demyelinating myelitis was established (onset was reported on the reporting form to be 12-APR-2010). On 03-MAY-2010, the patient was d

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Convulsion, Injury, Syncope, Thoracic vertebral fracture, Urinary incontinence

Symptom Text: Background: A foreign HPV vaccination program commenced in May 2007 for females aged 12-26 years. Syncope and syncopal seizures can occur with any painful stimulus. High rates of both have been documented post GARDASIL vaccination. Aim: To describe cases of 'syncope' and 'seizures' post GARDASIL vaccination notified to SAEFVIC. Methods: All reports of adverse events following immunization (AEFI) received by SAEFVIC between May 2007 - April 2009 were selected for analysis. AEFI following GARDASIL vaccine coded as seizure or syncope were reviewed. Results: During the study period, 6% (9711653) of all SAEFVIC reports met the criteria: afebrile seizures (3), syncopal seizures (31) and syncope alone (63). Median age at vaccination was 15 yrs (range 8-30 years). 23% (7131) of syncopal seizures had associated urinary incontinence. An injury was sustained in seven cases, including one vertebral (T5TT6) fracture. After clinical review, further GARDASIL vaccine doses were given under supervision whilst lying down for 20 minutes to 21 women with no recurrences. The rate of syncopal seizures was 2.6 per 100,000 doses of GARDASIL vaccine distributed. Conclusion: A high rate of syncope and syncopal seizures was seen post GARDASIL vaccination in one location. Clinical follow-up allows for clarification of the diagnosis, a physical examination and investigations as appropriate. Effective strategies to minimize the risk of recurrent syncope post vaccination include lying down before and 20 minute post vaccination. Upon internal review T5/T6 vertebral fracture was considered to be an other important medical event. Attempts are being made to identify the additional patients in this abstract. Additional information has been requested.

MedDRA PT Death, Drug exposure during pregnancy, Sudden infant death syndrome

Symptom Text: Information has been received from a nurse concerning an 8 month old male baby. The baby's 23 year old mother was vaccinated intramuscularly in the left deltoid with one 0.5 ml dose of GARDASIL (Lot #660618/0572X) on 21-OCT-2008. The mother's LMP was 22-SEP-2008. Estimated date of delivery was 29-JUN-2009. On 16-JUN-2009 the mother had a repeat scheduled Cesarean section, and delivered the male baby, weighing 7 pounds, 6 ounces. There was "no indication of any problems with the baby." The mother had no significant medical history, prenatal complications, and was not taking any concurrent medication according to the nurse. However, in February 2010, at about 8 months of age, the baby died of sudden infant death syndrome (SIDS). The nurse had no further information on this. A lot check was initialized. The mother's experience was captured in WAES #0811USA00264. Additional information is not expected.

MedDRA PT Burning sensation, Chest pain, Dizziness, Feeling hot, Headache, Hypoaesthesia, Immunisation reaction, Paraesthesia, Reflux oesophagitis

Symptom Text: Patient began complaining of (R) foot and leg numbness around 6 PM the day the vaccine was given. Patient developed headache and sensation of heat on back of head around the same time 2 days later, the patient complained of numbness in (R) hand that spread to (L) hand. The next day, the heat on her head and a feeling of lightheadedness prompted an ER visit. The following day, she returned to ER due to no improvement. The following information was obtained through follow-up and/or provided by the government. 6/9, 6/11 & 6/16/10 ED and OPV records received for dates of service 5/28/10 to 6/2/10. Dx: Disturbance of skin sensation, Headache. R arm numbness, R leg numbness. Medication Reaction. Immunzation Reaction. Presented to ED on 5/31/10 with c/o R arm and R leg numbness for a duration of 2 days, moderate in intensity which started with her menstral cycle. On 6/1/10 presented to ED with RUE warming, burning sensation and HA. On 6/2/10 presented to ED with c/o numbness to R arm and leg, radiating to L arm and leg occuring episodically also with hot sensation to the back of head. Also c/o feeling chest pain 2 hours after vaccination. Seen on 6/2/10 by PCP, with same c/o in addition to increased reflux.

Other Meds: Ranitidine 150 mg PO BID; Ibuprofen 800 mg PO QIP PRN

Lab Data: Per patient, an EKG, CT scan and blood work was done in the ER. The following information was obtained through follow-up and/or provided by the government. 6/9, 6/11 & 6/16/10 ED and OPV records received for dates of service 5/28/10 to 6/2/

History: None. The following information was obtained through follow-up and/or provided by the government. 6/9, 6/11 & 6/16/10 ED and OPV records received for dates of service 5/28/10 to 6/2/10. PMH: GERD

MedDRA PT Hypothyroidism, Multiple sclerosis

Symptom Text: Information has been received from a nurse practitioner concerning a 25 year old female with congenital adrenal hyperplasia- late onset 17 years no treatment or follow up since diagnosis, and penicillin allergy, who on 31-MAR-2010 was vaccinated with a first dose of GARDASIL (IM, lot # 665768/1377Y). Concomitant therapy included methotrexate and hormonal contraceptives (unspecified). No other vaccines were administered. On 04-MAR-2010, magnetic resonance imaging (MRI) of the thoracic spine, cervical spine and brain indicated the following: MRI of the thoracic spine showed multiple areas of abnormal signals predominantly in the inferior half of the thoracic spinal cord, compatible with areas of demyelination; MRI of the cervical spine showed multiple cord lesions, most important at C1-C2, compatible with demyelinating plaques and multiple sclerosis and severe left neural foraminal narrowing at C3-C4 related to disc osteophyte complex; MRI of the brain without contrast showed prominent periventricular white matter disease consistent with multiple sclerosis. Contrast enhancement to assess for acute plaque was recommended. Last week, on approximately 24-MAY-2010 the patient was diagnosed with Multiple sclerosis. The patient's multiple sclerosis persisted. The nurse practitioner did not believe there was a causal relationship. Their office had no other details since they are not the primary physician. The nurse practitioner contacted during the telephone follow-up could not supply the actual date of the event. Upon internal review, multiple sclerosis was considered to be an other important medical event. Additional information has been requested. The following information was obtained through follow-up and/or provided by the government. 06/17/10. PCP for 04/5/10, 06/14/10. DX: MS, hypothyroidism, congenital adrenal hyperplasia. tx: steroids, methotrexate.

Other Meds: hormonal contraceptives; methotrexate

Lab Data: magnetic resonance, 03/04/10 The following information was obtained through follow-up and/or provided by the government. Labs and DX studies: increased TSH, MRI abnormal.

History: The following information was obtained through follow-up and/or provided by the government. PMH: congenital adrenal hypoplasia. Allergies: PCN.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Convulsion

Symptom Text: Initial and follow up information has been received from a physician and a clinical coordinator concerning a 16 year old male patient with no known drug allergies, concurrent conditions or pertinent medical history who on 09-JUN-2010 was vaccinated with a 0.5 ml first dose of GARDASIL (lot number 665266/0298Z). The clinical coordinator reported that just prior to receiving GARDASIL the patient received a dose of VAQTA (lot number 667262/0245Z) and a dose of AFLURIA (manufacturer unknown) (lot number). There were no concomitant therapies (other than the mentioned vaccines). It was reported that the patient had not eaten before going to the office. The clinical coordinator reported that the patient experienced a seizure within 45 seconds of receiving the vaccination, the seizure lasted between 1 1/2 and 3 minutes, 911 was called. The patient was positioned and was given oxygen, no other treatment was needed. By the time the ambulance arrived the patient had fully recovered so a trip to the emergency room (ER) was not necessary. There were no plans for a neuro consult. It was reported that the patient wanted to receive the next dose. Upon internal review seizure was considered to be an other important medical event. No further information is available.

MedDRA PT Anaphylactic reaction, Hypersensitivity, Injection site erythema, Injection site swelling, Nausea, Pain, Rash, Skin erosion, Skin lesion, Urticaria, Vomiting

Symptom Text: Information has been received from a physician assistant concerning a 13 year old female with no pertinent medical history, who on 17-MAR-2010 was vaccinated with the first dose of GARDSIL (IM, lot # 662299/1099Y). On 17-MAY-2010, she received her second dose (IM, lot #663558/0819Y). The physician assistant confirmed that the patient did not receive concomitant vaccinations when the first and second dose of GARDASIL were administered. After the first dose the patient developed "painful rash-like symptoms on her belly." For this rash, BACTRIM and steroids. The patient was treated approximately 6 weeks earlier with antibiotics and steroids for rash which patient's mother was attributing to dose 1 of GARDASIL. The rash resolved. On 31-MAY-2010, she reported to the emergency room with anaphylaxis, transient nausea/vomiting, site of injection redness/swelling, and painful rashes. It was reported that the patient's rash (unknown type) occurred 2 weeks following dose 2 of GARDASIL. Rash was evaluated in the ER after dose 2 and the term anaphylaxis was reported to the reporter from ER report. The patient was diagnosed with an allergic reaction and an urticarial reaction. The P.A. stated that there was post-allergic reaction, the patient developed lesions under her left arm. The patient had been treated with a 5 day course of steroids and topical ointment. Everything was resolved, except some painful "lesions" under the left arm. Rash was evaluated yesterday (02-JUN-2010) in office-"axilla skin erosion" was described by reporter. She was recovering. Additional information has been requested.

MedDRA PT Abdominal pain, General physical health deterioration, Headache, Nausea

Symptom Text: Information has been received from a health authority (reference number PEI2010010729) from a pediatrician concerning an 18 year old female with a history of migraine who in 2009 was vaccinated with the third dose of GARDASIL (batch # NH38400, lot # 1400U) IM. In Nov 2009, 14 days post-vaccination the patient developed nausea, abdominal pain, headache and severely reduced general condition. The patient was admitted to hospital for an unspecified time. After unspecified symptomatic treatment the patient recovered completely. Approximately 14 days after first (batch# NH 25730, lot#1695U) and second (batch# NH25390, lot# 1477U) vaccination with GARDASIL on unspecified dates the patient had developed nausea, abdominal pain and headache. Other business partner numbers included: E2010-03431. Case is closed. No further information is available.

MedDRA PT Convulsion, Fatigue, Underdose

Symptom Text: Information has been received from a physician and medical assistant concerning a female patient with seizures who on 03-JUN-2010 was vaccinated with a dose of GARDASIL in her arm which was not fully injected. The patient most likely got a drop, if that, of GARDASIL when all the sudden the patient had a seizure and the medical assistant pulled out the shot immediately. The patient had a seizure a couple of months ago while at a dentist office. The patient called a neurologist and her primary care physician to be seen. The patient felt exhausted after her seizure. The patient was in the process of trying to become pregnant. The office kept the vial of GARDASIL to show that most of the dose was still in the vial. At the time of the report, the patient's status was unknown. Upon internal review, "seizure" was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Atrial septal defect, Cardiac murmur, Cough, Drug exposure during pregnancy, Nasal congestion, Patent ductus arteriosus, Rash

Symptom Text: Information has been received from a nurse practitioner and a consumer with no drug allergies and no pertinent medical history for GARDASIL, a Pregnancy Registry product. The baby's 24 year old mother did not have any previous pregnancies, pre-term deliveries, spontaneous abortions, elective terminations or fetal deaths. On 06-NOV-2008 the baby's mother was vaccinated with the first dose of GARDASIL (lot number unknown). On 23-JAN-2009 the baby's mother was vaccinated with the second dose of GARDASIL (lot number 661703/0651X). On 12-JUN-2009 the baby's mother was vaccinated with the third dose of GARDASIL (lot number 661703/0651X). On 16-FEB-2010, the baby's mother delivered the normal female baby with no congenital anomalies weighing 8 pounds, 7 ounces, length 20 inches. It was reported that the baby was stuck, so the patient had to have a C-section. The baby's mother had no concurrent medical conditions. On an unspecified date, the baby experienced heart murmur. At the time of the report, the patient's outcome was unknown. Follow-up information has been received via a medical record concerning the female baby with no known drug allergies who on 20-APR-2010 was vaccinated with the first dose of RECOMBIVAX HB (lot# 665622/1023Y) in her right thigh. Other concomitant vaccines administered on the same day included the first dose of DAPTACEL (manufacturer: Sanofi Pasteur) (lot# C3191AA) in the left thigh, the first dose of ACTHIB (manufacturer: Sanofi Pasteur) (lot# UF596AB) in the right thigh, the first dose of IPOL (manufacturer: Sanofi Pasteur) (lot#D0123) in the left thigh and the first dose of pneumococcal conj vaccine (unspecified) (manufacturer: Lederle) (lot#D93212) in the right thigh. On 24-FEB-2010, the 8 day old patient visited the office. her vital signs were within normal limits. She eats 2 to 4 ounces every four hours. She has bowel movements 1 to 2 times a day. At this visit the patient's patent ductus arteriosus was not audible. The patient was to follow up with cardiology as scheduled. On 05-MAR-201

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Birth mark, Circumcision, Congenital naevus, Drug exposure during pregnancy

Symptom Text: Information has been received from a Pediatrician via medical records concerning a male baby who was born to a 23 year old mother with allergy to anything in the "cillin family", PPD skin test positive and a history of caesarean section and tuberculosis exposure. It was reported that the mother had one previous pregnancy and one full term delivery. On 05-SEP-2008, 05-NOV-2008 and 16-MAR-2009 the mother was vaccinated with the first, second and third dose of GARDASIL, respectively (Lot # for the third dose: 661953/1130X). Her LMP was 16-FEB-2009. On approximately 17-MAR-2009, the mother experienced sharp pains located "4 inches below her belly button and 4 inches to the left of her belly button". She stated the pain might due to a previous caesarian section (see WAES #0903USA02927). On 16-NOV-2009, the mother delivered a normal, healthy male baby weighing 8 pounds, 6 ounces, length 21 inches. The mother had no complication and no infections or illnesses during pregnancy. The mother had no complication during labor/delivery. On an unspecified date the baby had a circumcision. On 12-APR-2010 the baby had a 4 month follow-up visit. It was reported that the baby was breast feeding 6 ounces every 2-3 hours and he was up 2 times at night. His height was 26 1/4 inches; weight was 18 pounds 6.5 ounces. Physical examination showed birth mark on his forehead and small Mongolian spot on his buttocks. The assessment was normal 4 month exam. On the same day the baby was vaccinated with the first dose of PREVNAR (lot #E38312) in the left, hepatitis B vaccine (Lot #AHBVB79CKA) in the left and PENTACEL (Lot# C355S7AA) in the right. Birth mark on his forehead and small Mongolian spot on his buttocks were considered to be congenital anomalies. Additional information has been requested. All available medical records will be provided upon request.

MedDRA PT Abdominal pain upper, Altered state of consciousness, Arrhythmia, Bradycardia, Hypertension, Hypotension, Hypotonia, Hypotonic-hyporesponsive episode, Neurogenic shock, Pallor, Paraesthesia, Pyrexia, Suffocation feeling, Vertigo

Symptom Text: Information has been received from a Health Authority (case n. 117752, local case n. IT253/10) concerning an 11 year old female patient with no medical history, no allergies, no fever and no other vaccines or drugs administered during the last 30 days prior to vaccination, who was vaccinated on 31-MAR-2010 at 15:00, with the first dose of GARDASIL (batch number NL44120, lot number 1353X) IM in the left deltoid. On the same day, five minutes following vaccination, she presented with vagal shock, altered level of consciousness (lipothymia) without loss of consciousness, tingling and a feeling of suffocation that resolved spontaneously. While being monitored at the vaccination clinic she also presented with alternating hypotensive and hypertensive episodes, bradycardia and arrhythmic pulse, pallor, fever 38 degrees celsius, hypotonia and hyporesponsivity. Due to the reoccurrence of the suffocation feeling, she was administered BENTELAN 4mg/2ml vial and saline solution IV. Due to onset of epigastric pain and vertigo emergencies were called and the patient was taken to the hospital at 16:15, she was discharged the same day at 19:00. The outcome is recovered on 31-MAR-2010. The agency coded transient alteration of awareness, arrhythmia, bradycardia, hypertension and hypotension. Other business partner numbers include: E2010-03467. The case is closed. No further information is available.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Convulsion, Dizziness, Partial seizures

Symptom Text: Information has been received from a Health Authority (reference numbers PA20100179 and PA1000184) concerning a 19 year old female patient with a history of reactive arthritis who experienced generalized convulsions 8 weeks after she had received the first IM dose of GARDASIL (batch NH43700, lot 1648U) on 18-NOV-2009. On 13-JAN-2010, she experienced the first fit of generalized convulsions. On 27-JAN-2010, she received the second dose of GARDASIL (lot not reported). On 03-MAR-2010, the patient experienced the sixth generalized fit, and a seventh one on 04-MAR-2010. On 08-MAR-2010, she was seen by a neurologist. Corrective treatment with KEPPRA was implemented. Generalized seizures stopped. Were reported: dizzy spells and nocturnal partial seizures of the left upper limb, in the site of vaccination (dose not reported). As of 20-MAY-2010, the patient still experienced partial seizures of the left upper limb. She had corrective treatment with TRILEPTAL 300 morning and 300 mg evening, LAMICTAL 50 mg morning and 50 mg evening, and KEPPRA 500 mg evening. Tests found normal magnetic resonance imaging (MRI) and normal electroencephalography (EEG). Metabolic work-up was not performed. The patient recovered from generalized convulsions; at the time of reporting, she had not recovered from partial seizures and the outcome of dizzy spells was unknown. The Health authorities assessed the causal relationship between the reported reactions and vaccination with GARDASIL as 'doubtful' (C1 S1 T1) according to the method of assessment. The seriousness criterion reported by the Health authority was "other medically important condition." The Health authority coded convulsions generalized, partial seizures and dizzy spells. Other business partner numbers include: E2010-03487. No further information is available.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Blood test, Breech delivery, Caesarean section, Drug exposure during pregnancy, Foetal disorder, Premature rupture of membranes, Ultrasound scan, Urinary tract infection

Symptom Text: Information has been received from a registered nurse, for GARDASIL, a Pregnancy Registry product, concerning a 26 year old female with no pertinent medical history and no allergies who on 27-APR-2009 was vaccinated IM with the second 0.5ml dose of GARDASIL (lot# 661952/1129X). There was no concomitant medication. The patient discovered that she was pregnant during the GARDASIL series. At the time of reporting, it was unknown when the patient received her first dose of GARDASIL. No adverse effects reported. The patient sought medical attention through an office visit. Blood work-up and ultrasound were ordered. Results were not received at the time of reporting. The patient's last menstrual period (LMP) was reported as 21-MAY-2009. The estimated delivery date (EDD) would be on 25-FEB-2010. Follow up information has been received from a health professional indicated that the patient experienced urinary tract infection during pregnancy and was treated with MACROBID 100mg, which started on 30-JUL-2009 for 7 days. The patient got a shot of flu vaccine on 12-OCT-2009. The patient developed preterm premature rupture of membranes during pregnancy, and on 26-DEC-2009, 31 weeks from LMP, delivered an abnormal male infant (weight 3 pounds 15 ounces, apgar 3/7) (0907USA03082B1). During delivery, the baby was in a breech position and had to have a cesarean delivery. The infant had intraventricular bleed. At the time of the report, the patient's outcome was unknown. Upon internal review, breech delivery was determined to be an other important medical event. The baby's experience has been captured in WAES# 0907USA03082B1. Additional information has been requested.

MedDRA PT Cervical dysplasia, Cervicitis, Papilloma viral infection

Symptom Text: Information has been received from a nurse practitioner concerning a 22 year old female patient who in January 2009, was vaccinated with the third dose of GARDASIL (Lot # not provided). It was reported that the patient was diagnosed with an abnormal pap smear. Both: low grade and high grade HPV were identified. No further details were given. At the time of the report the patient's status was not specified. Follow-up information was received from a health care professional via medical records, concerning the female patient with no illness at the time of vaccination and no known drug allergies who in 04-OCT-2007 was vaccinated with the first dose of GARDASIL, (Lot # 0560U), IM into the left deltoid, on 13-DEC-2007 was vaccinated with the second dose of GARDASIL (Lot # 655154/1210U), IM into the left deltoid and on 06-JAN-2009 was vaccinated with the third dose of GARDASIL (IM into the left deltoid. On 09-MAR-2010, a pap Smear test was performed which showed high grade squamous intraepithelial Lesion, mild dysplasia with HPV effect and chronic cervicitis. The squamous dysplasia extended into the endocervical glands. On 05-APR-2010, a colposcopy was performed which showed epithelial cell abnormality. A low grade squamous intraepithelial lesion (LSIL) was shown. At the time of the report, the outcome of the patient was unknown. High grade squamous intraepithelial Lesion and low grade squamous intraepithelial Lesion were considered to be an other important medical event per investigator. No further information is available.

Other Meds: Unknown

MedDRA PT Back pain, Chest pain, Dyspnoea, Pain in extremity, Pulmonary embolism

Symptom Text: This report was identified from a line listing obtained on request by the Company from the FDA under the Freedom of Information Act. A 22 year old female on 20-MAY-2010, was vaccinated with a second dose of GARDASIL (Lot number 661952/1129X). Concomitant therapy included DEPO-PROVERA. On 28-SEP-2009, the patient experienced pain in legs and back pain after 15 days/30 days. Shortness of breath 45 days. Pulmonary embolisms 45 days. Chest pains 45 days. A CT scan showed bilateral embolisms. The patient received 9 months of treatment with DOVE and warfarin. The listing indicated that one or more of the events required hospitalization, was considered to be immediately life-threatening. No further information is available. This was originally reported by a consumer. A standard lot check investigation has been finalized. All in-process quality checks for the lot number in question were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The Evaluation and Research and was released. The VAERS ID # is 390696-1.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Activities of daily living impaired, Back pain, Dizziness, Headache, Hypoaesthesia, Muscular weakness, Neck pain, Paraesthesia, Wheelchair user

Symptom Text: My healthy eighteen year old daughter received the GARDASIL vaccination in July, 2007. Immediately felt dizzy and had to lie down. The next week she mentioned that she had pain in her back and neck. Not knowing her symptoms were related to the GARDASIL vaccination, she had a second dosage in October, 2007. She went to the ER for a headache. She had numbness and tingling in her hands and arms, muscle weakness, and severe back pain. After many trips to the ER the neurology department - could not diagnose her. She had to use a wheelchair. A straight-A and once athletic student, she had to drop out of college due to her illness. Her EEGs were highly abnormal, including her evoked potential. We were sent to a clinic where they finally diagnosed her with fibromyalgia. The doctors didn't believe it was fibromyalgia and now her internal doctor feels it may have been due to the GARDASIL vaccine. Her doctor reported it to VAERS.

Other Meds:

Lab Data: EEG and Evoked Potential tests were abnormal. Autoimmune test was abnormal. Vitamin D levels were low.

History: No pre-existing conditions.

MedDRA PT Fatigue, Hypoaesthesia, Insomnia, Joint stiffness, Local swelling, Lymphadenopathy, Musculoskeletal stiffness, Oropharyngeal pain, Pain in extremity, Paraesthesia, Parotitis

Symptom Text: Patient states that the next day after vaccine administration she became fatigued. This resolved over a few days however several weeks later she had neck swelling which another MD diagnosed her with parotiditis and Rx antibiotics and Decadron. At the end of December she devleoped deep throat muscle pain and neck swelling. Strep throat swab negative. She was given another antibiotic. She then saw another MD who questioned MONO but she had had no fevers. He checked a CBC and WC was elevated and he prescribed another antibiotic. She then developed muscle and joint stiffness in her knees and shoulders and hips. An ENT MD saw her and a CBC was repeated with elevated white count and he saw lymphadenopathy. EBV blood test was positive. HE gave Decadron. She then received her second Gardasil vaccine on 1/10/2010. She then began having trouble sleeping along with her joint stiffness. She was prescribed Lortab. She then went to another MD who ordered arthritis labs (ANA, RF, ESR, TSH - all negative). White count normalized. He prescribed NSAID. She then started having numbness and tingling in her fingers and pain in her feet. No swelling, fevers, rash on exam. She did not get the third Gardasil vaccine.

MedDRA PT Loss of consciousness

Symptom Text: Initial and follow-up information has been received from a physician and a medical assistant, concerning a female who on an unspecified date last year, in 2007 was vaccinated with the third dose of GARDASIL. It was reported that the patient experienced seizure. The patient was walking out of the office and went down. In follow-up information received from the nurse, she reported that the patient did not have a seizure. She passed out and recovered while in the office. This is one of two patients concerning the same source. Additional information has been requested.

Seriousness: HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Activities of daily living impaired, Blindness transient, Convulsion, Dizziness, Fatigue, Headache, Hypoaesthesia, Ovarian cyst, Paraesthesia, Paralysis, Postural orthostatic tachycardia syndrome, Syncope

Symptom Text: My formerly healthy 15 yr. old daughter received her one and only dose of the GARDASIL vaccine on July 30, 2009. Since then, she has been plagued with headaches, fatigue, dizziness, numbness and tingling of the legs and feet, non-epileptic seizures, temporary paralysis/blindness, fainting, ovarian cysts, etc. She was hospitalised once and has been to the ER 5 times. She missed nearly the entire school year due to her adverse reaction to the vaccination. She has been evaluation by a psychologist and a psychiatrist both of whom state she is psychologically healthy and well-adjusted. She was recently diagnosed with POTS by a cardiologist. She is on numerous medications and cannot be left alone. I have since learned that there are thousands of other girls experiencing the same thing. If it's not the vaccine, what is it? Please take this vaccine off the market for further study before more innocent lives are compromised.

MedDRA PT Congenital anomaly, Congenital tongue anomaly, Cough, Dacryocystitis, Dacryostenosis congenital, Drug exposure during pregnancy, Ear congestion, Eye discharge, Feeding disorder neonatal, General physical condition abnormal, Jaundice neonatal, Nasal congestion

Symptom Text: Information has been received from a physician via medical records concerning a 3 day old infant who was born from a 26 year old female patient with no pertinent medical history and no known allergies, who on 28-JUL-2008 was vaccinated intramuscularly with 0.5 ml of the first dose of GARDASIL, the second dose on 22-SEP-2008 and the third dose on 16-DEC-2008 and conceived 1 week later after the third dose. The patient was seen on 18-MAR-2009 at the office and an ultrasound confirmed that the patient's gestation was 15 weeks and 2 days. On 02-SEP-2009, the patient was delivered by normal vaginal delivery at full term; weight 6 lb 1 oz, 20.5 inches, and head circumference 13 cm. On 04-SEP-2009, the patient had a short sublingual frenulum that was clipped. It was reported that on 05-SEP-2009, the patient was seen and the physical examination was normal except for abnormal appearance (jaundice). The physician recommended to watch the jaundice and to expose the patient to sunlight. The patient was diagnosed with neonatal jaundice and newborn feeding problems. On 17-SEP-2009, the patient was seen again in the office and the physical examination was normal except for an yellow drainage from left eye with no hyperemia, external ears and nose were congested, and cough. The patient was placed on erythromycin ointment to treat the eye. The patient was diagnosed with acute dacryocystitis and blocked tear duct/dacrostenosis. The patient was treated with erythromycin ophthalmic ointment, massage and cleaning. On an office visit on 05-OCT-2009, the patient was seen again and the physical examination was normal. The patient's weight was 9 pounds and 5 ounces (34% ile), height was 22.3 inches and head circumference was 36.8cm. Short sublingual frenulum and neonatal jaundice were considered to be congenital anomalies. The mother's experience is captured in WAES 0903USA03210B1. No further information is available.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Ankyloglossia congenital, Circumcision, Drug exposure during pregnancy, Laboratory test normal, Rash neonatal

Symptom Text: Information has been received from a certified nurse midwife via pediatric medical records concerning an infant who was born from a 25 year old female with no pertinent medical history and no drug reactions or allergies who on 09-JAN-2009 was vaccinated with a first dose of GARDASIL (Lot # 660616/0570X) 0.5mL, intramuscularly. On 14-APR-2009 she received second dose of GARDASIL (Lot # 661678/0904X, which was valid for MMR II) 0.5ml, intramuscularly. Concomitant medication included vitamins. The patient's mother became pregnant. The patient's mother last menstrual period was on 17-APR-2009. Estimated date of delivery was 22-JAN-2010. It was reported that the patient's baby was born on 18-JAN-2010 at 7:41, weighing 3042g. The patient's mother was 39 weeks from her LMP. It was reported that the baby had a normal development and the review of systems was within normal limits, except for a newborn rash and a tongue tie. The baby's circumcision was healing well. It was also reported that the baby was tongue tied. The plan was to give ambulatory guidance. Laboratory tests performed were normal. Tongue tie was considered to be a congenital anomaly. The mother's experience is captured in WAES 0905USA03365. No further information is available. All available medical records will be provided upon request.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Activities of daily living impaired, Back pain, Fibromyalgia, Headache, Impaired work ability, Muscular weakness, Musculoskeletal pain, Myalgia, Pain, Pain in extremity, Vaccination complication

Symptom Text: Information has been received from a Health Authority on 09-JUN-2010 under reference 2010-01497. A 15 year old female patient received was vaccinated on the 10-NOV-2008 a first dose of GARDASIL (0.5 mL, batch # and site of administration not reported) via intramuscular route. The patient received the second dose of GARDASIL on 19-JAN-2009 and the third dose on 12-JUN-2009. In January 2009, she developed lumbar back pain for the first time. In the summer of 2009, she also developed shoulder pain with exacerbation and spread of the pain to the upper and lower limbs. The symptoms ultimately converged into a generalised pain syndrome with muscle pain, muscle weakness and headache. The patient was admitted to hospital for further examinations. No cause of the symptoms was found (rheumatological and neurological diagnostic investigations were negative, bony pathology of the cervical spine, arm and thigh musculature were unremarkable on ultrasound), so a relationship with the HPV vaccination was suspected. Certain symptoms of fibromyalgia were present, although clear indications of dermatomyositis and pressure points associated with fibromyalgia were negative. Therefore, fibromyalgia can neither be ruled out nor confirmed and remained a diagnosis to be excluded. The girl was otherwise healthy and was not taking any other medicines. For the symptomatic treatment of the pain in her thighs, the patient was treated with LIORESAL for muscle relaxation in November 2009 and SAROTEN RETARD leading to a slight improvement of the symptoms. Physiotherapy and acupuncture were unsuccessful, psychological care to help cope with the continuing pain situation was initiated. Outcome: The patient had not recovered and had sequelae including pain-induced termination of training in the public healthcare sector, currently unemployed, no more sports. Sender's comment: According to the agency, arthralgia and myalgia and headache on GARDASIL were listed as possible ADRS. The agency gives further details on this from the respective clinical stu

MedDRA PT Confusional state, Convulsion, Incoherent, Loss of consciousness, Nausea, Neurological examination normal, Presyncope, Staring, Syncope, Tunnel vision

Symptom Text: Mom states daughter had a seizure, was convulsing and incoherent. Mom took daughter to ER where tests were run to include a CAT scan. All tests were negative. Daughter became coherent after one hour of the event. Daughter is doing well now. Next week is scheduled for an MRI and EEG and then will see the neurologist. The following information was obtained through follow-up and/or provided by the government. 6/29/10 ED records received for date of service 6/16/10. Dx: Seizure. Pt. received immunizations. On the way home in the car c/o nausea, then described having tunnel vision followed by passing out. Mom observed flexing of arms in a rhythmic fashion along with head nodding while staring blankly, all sx. lasting about 3 minutes. Afterward patient was confused for about one hour. Presented to ED in NAD. VSS. CT of head normal. F/u EEG and MRI scheduled as well as appt. with neurology. Pt. discharged to home. 7/30/10 Neurology consult received for dates of service 7/14/10. Dx: Vasovagal syncopal attack. Neurological exam normal. EEG and MRI normal. Vasovagal syncopal attack diagnosed. To follow up with neurology only if necessary.

Other Meds: none

Lab Data: blood work, urine, CAT scan negative results The following information was obtained through follow-up and/or provided by the government. 7/30/10 Neurology consult received for dates of service 7/14/10. EEG-NL. MRI-NL.

MedDRA PT Convulsion, Immediate post-injection reaction, Syncope

Symptom Text: Information has been received from a physician concerning a female (in her late teens) who on 14-JUN-2010, at approximately 1pm, was vaccinated with the first dose of GARDASIL. On 14-JUN-2010, immediately after vaccination, the patient experienced fits and fainted. The physician allowed the patient to rest and subsequently, the patient recovered from fits and fainted. The patient has no history of fits and the mother said that the daughter had no issue with other vaccinations. At the same time that the patient was vaccinated, her two other sisters also came for the vaccination with GARDASIL. The "first sister vaccinated was ok". The patient was the second to be vaccinated. No information was provided concerning the third sister. Causality is unknown, but the physician thinks that it could be because the patient did not eat before coming for the vaccination. Upon internal review, fits was considered as an important medical event. Additional information has been requested.

MedDRA PT Abasia, Abdominal pain, Anaemia, Balance disorder, Blood potassium increased, Chills, Complicated migraine, Confusional state, Constipation, Diarrhoea, Dizziness, Dysphemia, Flank pain, Gait disturbance, Headache, Hemiplegia, Hypertension, Hypoaesthesia, Lethargy, Migraine, Muscular weakness, Oedema peripheral, Paraesthesia, Postural orthostatic tachycardia syndrome, Syncope, Vision blurred, Vomiting

Symptom Text: Blurred vision, fainting, paralysis on left side, numbness, tingling, lethargic, stuttering, headache, constipation, abdominal pain. The following information was obtained through follow-up and/or provided by the government. PCP, ED records received 6/21/10. Service dates 1/26/07 to 10/28/08. Assessment: Possible migraine. 7/24/08 - Last week diminished vision, now legs and (L) arm numb, weak. 7/24/08 - Patient presents to ED with weakness of left upper extremity, left lower extremity, difficulty walking. Off balance, paresthesias of left upper and lower extremity. In no acute distress. Symptoms almost resolved after motrin administered. 8/7/08 - (R) side pain, vomiting and diarrhea. 10/28/08 - Patient c/o (L) flank pain and vomiting. 6/23, 6/25, & 6/28/10 Neurology and PCP records received for dates of service 9/24/08 to 6/17/10 Dx: Postural Orthostatic Tachycardia Syndrome. Anemia. Dizziness. Fainting. Hypertension. Migraine HA. Stroke Syndrome. Presents for evaluation of an episode of numbness affecting the L side of her body, and weakness to the extent of being unable to walk. Recently pt. was at work and developed numbness, went to ED where she experienced confusion and was diagnosed with complicated migraine. On another occasion pt. had tingling in the neck "like a cold chill." BP was high in the ED at 130/110. CBC revealed mild anemia. Had a transient episode of leg swelling which resolved spontaneously. Also has syncopal events lasting 15 to 20 seconds, preceeded by dizziness, lightheadedness and balance problems and followed by HA's. Dx of POTS made by tilt table.

Other Meds: Dose 1 Gardasil 1266U IM LA 12/12/07 Dose 3 Gardasil 0843X IM LA 10/09/08

MedDRA PT Blood test normal, Eye pain, Headache, Visual acuity reduced

Symptom Text: Information has been received from a pharmacist concerning a 17 year old female who on 20-MAR-2010 was vaccinated with the first dose of GARDASIL (expiry APR-2011). On 02-MAY-2010 the patient was vaccinated with the second dose of GARDASIL (batch # NJ35160 lot 0777X, route and site not reported). The patient had no medical history, was described as sporty and resistant to pain. She had no concomitant treatment. The patient experienced reduced visual acuity and frontal headache after she had received the second dose of GARDASIL. On 11-MAY-2010 9 days after vaccination she noticed a sudden decrease in her visual acuity. On 12-MAY-2010, the ophthalmologist confirmed a decrease by 2/10 of the right eye's acuity. On 14-MAY-2010 the patient developed daily bouts of frontal headaches, the duration of which was unknown. Headaches were located in the forehead, around the eyes and "in" the eyes. She received corrective treatment with analgesics. Brain MRI and CT scan (dates not specified) were normal. Visual evoked potentials: marked bilateral extension of P-wave, from 100 to 120 msec. Routine blood work-up was normal. According to the neurologist and the ophthalmologist, considering the VEP, it was not a manifestation due to fatigue. No diagnosis was established. At the time of reporting, symptoms persisted. The patient was due to consult the neurologist on 14-JUN-2010. Upon internal review the case was considered medically significant. Other business partner numbers included: E2010-03632. No further information is available.

Other Meds: Unknown

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Blood test, Facial bones fracture, Fall, Loss of consciousness

Symptom Text: Information has been received from a physician, via an Agency (manufacturer # not reported), concerning a 16 year old female patient who was vaccinated with a dose of GARDASIL (date not reported). This report was part of a post-marketing surveillance program. Subsequently the patient passed out after administration and broke nose after falling. The event required a visit to the emergency room. Diagnostic tests carried out to diagnose the AE were blood work and blood pressure (results not reported). The patient recovered with sequelae. It was reported that therapy with GARDASIL was discontinued and that the events diminished after stopping therapy. The reporting investigator felt that passes out and broke nose were related to study therapy. Upon internal review it was considered that passes out and broke nose were other important medical events because the reporting investigator reported it as serious and no serious criteria were reported. No further information is available.

MedDRA PT Activities of daily living impaired, Bed rest, Coxsackie virus test, Dehydration, Echovirus test, Electroencephalogram normal, Enterovirus test, Fundoscopy normal, Headache, Human papilloma virus test, Intracranial hypotension, Lumbar puncture, Nasal turbinate abnormality, Nasal turbinate hypertrophy, Pain, Post lumbar puncture syndrome, Sensation of pressure, Vomiting

Symptom Text: Case received from Health Authority on 04-MAY-2010 (case n. 116192) through SPMSD (local case n. IT203/10). An 11 year old female on 19-APR-2010 was vaccinated with the second dose of GARDASIL (IM, batch # NL44120, lot # 1353X). On the same day the patient was presented with significant headache not responding to treatment with analgesics. One week after onset of symptoms the patient was hospitalized. A brain MRI, head CT scan and CSF exam were performed and were all negative. The patient was discharged and recovered on 03-MAY-2010. The case is closed. Follow up information received from HA on 03-JUN-2010: The patient was admitted to hospital on 26-APR-2010 because of headache. She had received GARDASIL on 19-APR-2010 and the same evening the patient was presented with pulsating temporal headache not preventing the patient from sleep but precluding her daily activities. A recent ophthalmic consultation had excluded visual problems. Investigations performed on 23-APR-2010 (EEG), 24-APR-2010 (brain MRI, CBC, and C-reactive protein) were all within normal range. Upon admission, the patient was in good general conditions, regular vital signs, regular objective and neurological examination. Pain to pressure on the frontal and maxillary areas. Investigations performed during admission: neurological consultation, negative. ENT consultation no certain signs of acute sinusitis, advised facial CT scan which showed hypotrophy of the left inferior turbinate and modest hypertrophy of the right inferior turbinate with the mucosa touching in certain spots the mucosa of nasal fossa. Due to the headache persistence, on 27-APR-2010, a rachicentesis was performed, chemical analysis negative. Result not available for viral testing for HPV, enterovirus, neurotropic echovirus and coxsackievirus A and B. On 29-APR-2010, the patient's condition worsened the headaches forced her to lay in bed and worsened with vomiting if she assumed the seating position. A fundus oculi was performed and was normal. The patient was reassessed by the neur

MedDRA PT Abdominal discomfort, Asthenia, Convulsion, Crying, Dizziness, Dyspnoea, Fatigue, Headache, Musculoskeletal stiffness, Nausea, Pallor, Posture abnormal, Tremor, Unresponsive to stimuli

Symptom Text: Approx 5 minutes after the vaccination client reported being dizzy. Approx. 1 minute after she said she was dizzy she then stated she was going to pass out. She then almost immediately went unresponsive and slumped over. She remainded unresponsive for approx. 2 minutes and also stiffened out her body and had seizure like tremors all within that 2 minute time period. Client then responded to me after this 2 minute time period and started to cry. Lips were ashen grey and she stated she was going to throw up, was extremely exhausted and had a massive headache. Client never did throw up but was extremely nauseated and continued to complain of a headache. She recovered moderately well in our office. Significant other then came to pick her up and take her home. I called client back on 6/17/10 to check on her and she stated she was having shortness of breath, still nauseated, headache, dizziness, no energy, and had taken Benadryl the night before to help sleep. Encouraged her to follow up with her dr. I spoke with client again on 6/18/2010 and she said she had no more shortness of breath but did go see her chiropractor to get "detoxified". She did report still having stomach upset and feeling tired but did feel better. I then called her on 6/22/10 and she reported still being sick to her stomach and having to take rest periods at work and having headaches.

MedDRA PT Rash erythematous

Symptom Text: CLIENT WAS GIVEN 1 YEAR OLD SHOTS ABOUT 10:40AM. ABOUT 11AM, MOTHER CAME IN WITH CHILD. CHILD HAD A FINE RED RASH NOTED ON FACE AND BOTH ARMS. NONE NOTED ON BACK, STOMACH OR LEGS. CLIENT DID NOT APPEAR TO BE IN ANY RESPIRATORY DISTRESS. BENADRYL LIQUID WAS GIVEN AND TOLD TO WAIT FOR AWHILE IN WAITING AREA BEFORE LEAVING. AFTER ABOUT 20 MINUTES OR SO MOM STATED THAT SHE HAD TO LEAVE. CLIENT STILL DID NOT APPEAR TO BE IN ANY DISTRESS. RASH STILL NOTED ON FACE AND ARMS BUT NO OTHER PLACE. TOLD MOM TO GIVE BENADRYL AS DIRECTED AND IF CLIENT DEVELOPED ANY RESPIRATORY PROBLEMS OR RASH SPREAD TO TAKE TO ER AND TO TAKE SHOT RECORD WITH HER. GAVE MOM OUR PHONE# AND TOLD HER I WOULD CALL TO CHECK AND SEE HOW CLIENT WAS DOING NEXT DAY. BENADRYL WAS DISPENSED TO CLIENT 4/27/2010. 8:45AM 4/28/10 CALLED TO CHECK ON CLIENT BUT ANSWERING MACHINE CAME ON. I GUESS IT WAS THE FATHER. HE STATED HE WAS AT WORK AND TO CALL BACK AT 3:30 WHEN HE GOT HOME. 4:20PM 4/28/10 LEFT MESSAGE. WILL CALL AGAIN IN MORNING. 10AM 4/29 LEFT MESSAGE FOR 3RD TIME. 10:20 CLIENTS MOTHER CALLED AND SAID HE WAS DOING FINE. RASH IS RESOLVING BUT NOT COMPLETELY GONE. NO FEVER OR RESPIRATORY PROBLEMS. CON'T TO GIVE BENADRYL AS PRESCRIBED. DR. WAS NOTIFIED ON 4/28/10. RECOMMNEDATION: RASH WITHOUT ANAPHYLAXIS IN NOT CONTRAINDICTATION TO FURTHER IMMUNIZE. PREMEDICATION COULD BE CONSIDERED. The following information was obtained through follow-up and/or provided by the government. 8/26/10 Child did not receive any additional outside medical attention.\jc

Symptom Text: Information has been received from a male in his forties who was vaccinated with 2 doses of GARDASIL (dose, therapy route unspecified). No AE reported. Follow up information has been received from the 43 year old male consumer indicated that he was vaccinated with two doses of GARDASIL before it was approved for men. He received the first dose of GARDASIL on 05-MAR-2008 and the second dose of GARDASIL on 23-APR-2008. He did not receive a third dose of GARDASIL. There were no lot number was provided. It was unknown if the patient sought medical attention. At the time of report the patient's status was unknown. Additional information has been received from the 43 year old male patient who was vaccinated with his first and second doses of GARDASIL in March 2008 and April 2008. The patient stated then he was diagnosed with colon cancer in October 2008. He underwent surgery and chemotherapy and he was in remission. No further information was available. Upon internal review, colon cancer was considered to be an other important medical event. Additional information has been received from a medical assistant concerning the 40 year old male patient (previously reported as 43 years old) was referred to a physician of gastroenterology and internal medicine. The patient was admitted to hospital on 30-OCT-2008. The patient had a laparoscopic anterior resection (hospitalization dates were not reported). It was reported that on 18-DEC-2008 the patient was admitted to hospital for a total abdominal colectomy (hospitalization dates were not reported). Additional information has been received from the medical assistant from the administering physician's office who stated that there was no documentation in the patient's chart that he received any GARDASIL vaccinations at the physician's office. Follow up information has been received from the physician via medical records indicated that the patient was a 41 year old male with a long history of irritable bowel, some rectal bleeding for about six months and a family history of colon

MedDRA PT Abortion spontaneous, Drug exposure before pregnancy, Pregnancy test urine

Symptom Text: Information has been received from a physician, for GARDASIL, a Pregnancy Registry product, concerning a 23 year old female with no medical history who on 02-DEC-2009 was vaccinated intramuscularly with the first dose of GARDASIL (lot # 663454/0672Y, 0.5 ml). On 03-FEB-2010, the patient was vaccinated intramuscularly with the second dose of GARDASIL (lot # 661758/1480Y, 0.5 ml). There was no concomitant medication. The reporter became pregnant after receiving the vaccine. No adverse effect reported. Urine test was performed (result not provided). The LMP was 08-JAN-2010. The estimated delivery date was on 15-Oct-2010. At the time of the report, the outcome was unknown. Follow up information was received from the physician reported that the patient experienced an early miscarriage on an unspecified date. Upon internal review, an early miscarriage was considered to be an other important medical event. Additional information is not expected.

MedDRA PT Polyneuropathy

Symptom Text: Case received from a gynecologist on 16-JUN-2010. A female patient developed polyradiculoneuritis after she had received an injection of GARDASIL (batch number not reported) on an unspecified date. The reporter specified that the patient was the daughter of a patient of his. Unspecified investigations were performed in hospital. The physicians who took care of the patient did not incriminate GARDASIL. On the other hand, the patient's mother was convinced that there was a link with the vaccine. According to the reporter, the patient had "settled in handicap". He could not provide any further information regarding this case. At the time of reporting, the patient had not recovered. Polyradiculoneuritis was considered to be disabling. Other business partner numbers included E2010-03761. No further information is available.

MedDRA PT Body temperature increased, Congenital anomaly, Conjunctivitis, Constipation, Cough, Crying, Drug exposure during pregnancy, Eye swelling, Eyelid margin crusting, Gastrooesophageal reflux disease, Hernia, Hydrocele, Infantile spitting up, Nasal congestion, Scrotal swelling, Upper respiratory tract infection

Symptom Text: Information has been received from a pediatrician via medical records concerning a male baby who was born to a 17 year old mother with mild intermittent asthma. On 10-AUG-2009 the mother was vaccinated with the first doses of GARDASIL (Lot # 662300/0100Y). On 09-MAR-2010, 37.6 weeks from LMP the mother delivered a normal, healthy male baby weighing 7 pounds, the mother delivered a normal, healthy male baby weighing 7 pounds, length 19.5 inches, apgar score 9.9, head circumference 13. The mother had no complication and no infections or illnesses during pregnancy. The mother had no complication during labor/delivery. On 19-MAR-2010, the baby was brought to the pediatrician's office. It was reported that the baby weighing 7.9 pounds, length 20 inches, head circumference 14, body temperature 99.1 degree F. The baby was fed every 2-3 hours and he had been spitting up. The baby was diagnosed with mild GERD. On 14-APR-2010, the baby had a one month follow-up visit. It was reported that baby weighing 9.13 pounds, length 21 5/8 inches, head circumference 14 3/4, body temperature 97.8 degree F. The baby ate well, still spitted but not much. It was reported that the baby's left eye had been crusted ever since birth, spitting up a lot. The mother put child back on SIMILAC advance because ENFAMIL AR was causing constipation. On 21-APR-2010, the baby was brought to th pediatrician's office. The baby had cough symptoms, and stuff nose with body temperature 99.2 degree F. It was reported that the baby ate well, weighing 9.5 pounds. The baby was diagnosed with upper respiratory infection (URI). On 03-MAY-2010, the baby was brought to the pediatrician's office. The baby was weighted 11.7 pounds, body temperature was 98.8 degree F. It was reported that the baby cried for 2 days non stop and he had balls swollen. The baby was diagnosed with hydrocele, GERD and ?small hernia. On 19-MAY-2010, the baby was brought to the pediatrician's office. The baby was weighted 12.8 pounds, body temperature was 98.4 degree F. It was reported that t

MedDRA PT Caesarean section, Drug exposure during pregnancy, Obstructed labour

Symptom Text: Information has been received from a registered nurse, for the Pregnancy Registry for GARDASIL, concerning a 17 year old female patient with allergy to codeine who on 23-AUG-2009 was vaccinated intramuscularly with the first 0.5ml GARDASIL (lot # not reported). Fatal ultra sound was performed. The patient was 22 weeks pregnant on 22-Oct-2009. The patient sought medical attention via office visit. Follow up information has been received from a registered nurse concerning a 17 year old female patient with no previous pregnancies who on 12-AUG-2009 (reported as 23-AUG-2009 previously) was vaccinated intramuscularly with a 0.5ml GARDASIL (lot # 662229/1497X). On 12-OCT-2009 ultrasound was performed and it was found the patient was 22+5 weeks pregnant and normal anatomy. The nurse reported the patient's last menstrual period was 04-MAY-2009 and the estimated delivery date was 07-FEB-2010. She also reported that the date of last menstrual period could also be 20-JUN-2009 and the estimated delivery date was 17-MAR-2010. Follow-up information has been received from a medical assistant (MA). The MA pulled the patient's chart and provided pregnancy outcome information. The patient had a cesarean section on 07-FEB-2010, secondary to having a "bony pelvis". She delivered a healthy, 7lb 14oz baby. The MA also added that there was "nothing in the report to indicate there were any problems with the baby." The patient had recovered and didn't have any post operation complications. Upon internal review, cesarean section secondary to having a "bony pelvis" was determined to be an other important medical event. Additional information is not expected.

MedDRA PT Pulmonary embolism

Symptom Text: Information has been received from a gynecologist. The reporter indicated to have been receiving in the last 6 months, information concerning pulmonary embolism after the administration of GARDASIL. The reporter received the information from patients reading the internet or from other physicians who read or heard about the event. No other information is available. This is a hearsay report in the absence of an identifiable patient. Attempts are being made to verify the existence of a patient. Upon internal review, pulmonary embolism was considered to be an other important medical event. This report is one of several reports related by the same source. Additional information has been requested.

MedDRA PT Condition aggravated, Convulsion, Death

Symptom Text: Information has been received from a Registered Nurse concerning an 18 year old female patient with a history of seizures prior to GARDASIL, who on an unspecified date was vaccinated with a dose of GARDASIL. The nurse advised that the patient experienced seizure and subsequent death after receiving GARDASIL. It was not advised which injection in the series caused the adverse experience or how the injection was administered. The health care professional was contacted by telephone and call would not supply the following information: patient name, date of birth, dates of vaccination/therapy, dose number, lot number and date of event. Seizure was considered to be disabling and immediately life-threatening. Additional information has been requested.

MedDRA PT Breech delivery, Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a registered nurse, for the pregnancy registry for GARDASIL concerning a 17 year old female with no known drug reactions or allergies and no pertinent medical history who on 30-SEP-2009 was vaccinated intramuscularly with her first 0.5 ml dose of GARDASIL (Lot # 662518/0087) while pregnant. LMP: 15-MAR-2009. EDD: 20-Dec-2009. Concomitant therapy included prenatal vitamins (unspecified). No adverse effect was reported. The patient sought unspecified medical attention. Follow up information was received from a registered nurse, concerning a 17 year old female patient, with history of colposcopy (on 11-AUG-2009), allergies and vaginal yeast infection. Concomitant therapy included vitamins (unspecified), MONISTAT and CLARITIN. The patient EED was also reported as 10-JAN-2010. On 21-MAY-2009, an ultrasound of routine was performed and showed: Viable pregnancy. On 18-DEC-2009, the patient delivered a healthy normal baby (ID 50705) and had a complication during labor/delivery specifically Breech-C section. Upon internal review breech C-section was considered an other important medical event. No further information was available.

Other Meds: Claritin; Monistat; vitamins (unspecified)

Lab Data: ultrasound, 05/21/09, Viable pregnancy

History: Vaginal yeast infection; Colposcopy

MedDRA PT Convulsion

Symptom Text: Information has been received from an office registered nurse concerning a 16 year old female patient who on an unspecified date was vaccinated with the first dose of GARDASIL. After receiving the vaccine the patient had a seizure. The patient sought unknown medical attention. The nurse reported that the patient was not receiving anymore doses of GARDASIL and was now on anti-convulsant medication (name and manufacturer unspecified) for the seizures. Additional information has been received from the registered nurse who indicated that the patient's mother had come to the clinic for a DEPO-PROVERA injection. The patient's mother stated that her daughter had received the first dose of GARDASIL at another physician's office (physician's name and contact information was not reported). The patient began to have seizures after she had received GARDASIL vaccination. The GARDASIL vaccinations were discontinued because it was not known if the GARDASIL vaccination had caused the seizures. The reporter stated that she did not know the patient's name or contact information and was not able to give any additional information. At the time of report the patient's status was unknown. Upon internal review, seizure was considered to be an other important medical event. Additional information is not expected.

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Abdominal pain upper, Acne cystic, Activities of daily living impaired, Alopecia, Arthralgia, Asthenia, Blood test normal, Computerised tomogram normal, Convulsion, Crying, Depression, Disturbance in attention, Dizziness, Fatigue, Gaze palsy, General physical health deterioration, Joint stiffness, Menstrual disorder, Migraine, Muscle twitching, Myalgia, Nausea, Pain, Pallor, Psychiatric symptom, Scan brain, Syncope

Symptom Text: Information has been received from parents concerning their daughter who in April 2008, was vaccinated with the first dose of GARDASIL (LOT# not reported). The parents reported that their daughter was a healthy, energetic, outgoing, active beautiful girl until the April 2008 when she was administered her first GARDASIL shot. From that day forward, her quality of life has drastically deteriorated. It started when the plunger of the syringe hit the bottom of the tube and she turned pale white, her eyes rolled back in her head; she twitched (as if she was having a seizure) and fainted. For the past two years, their daughter has been suffering debilitating stomach pain, severe migraine headaches, severe hair loss, severe dizziness, severe muscle & joint pain, severe fatigue & weakness, severe seizures & fainting, severe cystic acne and severe menstrual abnormalities, every single one of these painful changes in her life are severe, not mild or normal. The parents stated that they have made numerous trips to doctor's offices, specialists, alternative medicine practitioners, dermatologists and ER room. She has made numerous CT scans of the stomach and brain as well as many blood tests and general evaluations. All of these tests hadn't been able to determine the cause of her problems but they started when she was given the GARDASIL shot. Their daughter's life had greatly deteriorated over the past 2 years and continued to do so. On her good days she felt sick to her stomach, tired and didn't want to do anything but lay around. She was starting to demonstrate signs of depression; she didn't want to go visit with her friends anymore because of the constant pain. She was falling behind in her school work because she couldn't concentrate. Her acne was so bad and she was ashamed to go outside of the house. The parents stated that their daughter (who was an actress) had lost much of her confidence, due to the acne and constant pain, and wasn't able to audition with the same sparkle she once had. She was a very active girl who

MedDRA PT Dizziness, Pallor, Vomiting

Symptom Text: 10:15 - PT was given 3 vaccines: HPV in (R) thigh, and MCV and hepatitis A in (L) thigh. She was in supine position. Afterwards Pt stood up and became dizzy and pale. Sat down with water, voiced concerns of vomiting, and then said she felt better. 10:25 - MD was brought into room, talked to PT. MD said common s/e of HPV are dizziness, paleness. Pt soon then bent over and vomited twice. Pt was helped onto exam table. 10:30 - PT was given a cold cloth for her forehead, and immediately voiced, "I feel better." Vitals were monitored. Pt remained in office x 10 minutes for observation. She was slowly brought into standing position again. MD asked father to keep PT's activities "light for the day." Father agreed, and Pt left clinic with father.

MedDRA PT Activities of daily living impaired, Crying, Headache, Pain in extremity, Pyrexia, Vaccination complication

Symptom Text: Mother called in am of day following vaccinations (6/23) to report that child had "slight fever, headache, sore arm." RN advised her to give him ibuprofen and monitor if condition worsened. Mother called back later in day to report that he no longer had a fever or sore arm, but that he "had a severe headache" and was "not able to get up and was continually crying." Mother was then advised to take him to Urgent Care/ER. Telephone follow-up was done with mother the next day (6/24), and she reported that she did take him to ER, and they checked him out. Says she was told it was "probably a vaccine reaction since he got several shots." Says that he had no more problems, and had completely recovered.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Arthralgia, Erythema, Hypersensitivity, Lip swelling, Oedema mouth, Oropharyngeal pain, Pain, Pain in extremity, Pruritus, Pyrexia, Rash generalised, Respiratory tract infection, Tenderness, Urticaria

Symptom Text: Information has been received from a Health Authority (NO-NOMAADRVE-FHI-2010-10675, FHI 10-1346) concerning 12 year old girl who was vaccinated with GARDASIL (dose 3, batch number not reported, 1 d.f. parenteral) on 02-JUN-2010. HA coded fever, urticaria generalized (verbatim: itching and rash whole body) with onset on 02-JUN-2010. HA coded events with onset on 03-JUN-2010: erythema (erythema papulous and circular, distributed around joints of knee, elbow, wrist, finger foot and toe, arthralgia (pain in legs when walking, started in wrists), swelling lips (swelling around the mouth), and throat sore. Causality possible for all events. The patient had medical history of otitis and was treated with APOCILLIN (mfr unknown, start date is unknown). Treatment with APOCILLIN, due to otitis media, was completed on 01-JUN-2010. It was reported that the girl developed urticaria covering the whole body six hours post vaccination. She also experienced fever the same day. On 03-JUN-2010 she developed additional symptoms of pain in wrists and legs when walking, papulous and circular erythema distributed around joints of knee, elbow, wrist, finger, foot and toe and tenderness. She also swelled around her mouth and she experienced a sore throat. Tests performed on 03-JUN-2010 showed body temperature 38.2 C and pulse rate 128, regular (no unit reported). Tests performed on 04-JUN-2010 showed: white blood cell counts 15.4-12.8 (no unit reported), differential white blood cell count: neutrophiles 85-84%, lymphocytes 9-10%, C-reactive protein 12-18 (no unit reported) and red blood cell count sedimentation rate 13 (reframes not reported). Since onset of urticaria and general symptoms were few hours after vaccination, a strong allergic reaction to the vaccination were suspected. Other explanation was considered as reaction to concomitant respiratory tract infection, otitis and the antibiotic treatment. The outcome for fever was recovered (on 04-JUN-2010). The outcome of erythema, tenderness, arthralgia, swelling lips, urticaria genera

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Confusional state, Fall, Loss of consciousness

Symptom Text: We were discussing family planning issues and her upcoming trip when I gave the nurse authorization to administer the Gardasil which she did in the left deltoid area. The patient did not report any immediate discomfort at the injection site. Approximately 3 minutes later, while still sitting chatting comfortably on the exam table, she suddenly reared back and pitched sideways off the table, impacting with her head on the floor, apparently unconscious. I opened the airway and stabilized the cervical spine and called for help as well as having the staff alert her mother who was, at that time, in the waiting room. I advised transport to an emergency room for cervical spine films. No seizure activity was seen. I estimate that she was unconscious for approximately 10 seconds. She was briefly confused but regained orientation quickly. She indicated that one of her lower incisors appear to be chipped; indeed, a small fragment of the tooth margin was recovered (less than 2 mm). The cervical spine was maintained in a stable position until 911 arrived and applied a rigid cervical collar and moved her to a backboard. She was able to move all 4 extremities without difficulty. Her mother indicated that she would like to have her proceed with the rest of the immunization series, but lying down next time..

MedDRA PT Body temperature increased, Injection site pain, Vomiting

Symptom Text: In the night 12 hours after injections high temp 101 degrees. Vomited next morning x 1. No local reaction other than soreness at injection site (L)>(R) mother reported at 10 am. Instructed to treat fever, clear liquids advance as tolerated. Mom calls again at 1:15 pm 6-29-10 to report fever now 100.2 degrees but has headache (moderate) "doesn't feel well at all". Instructed to use TYLENOL or ADVIL for fever + headache-which they did not treat earlier as instructed. 5:00 pm (TC) no fever after 2 TYLENOL no headache up and around-just tired. 6-30-10 (TC) all symptoms gone. Normal state of health.

MedDRA PT Drug exposure during pregnancy, Premature labour

Symptom Text: Information has been received from a registered nurse for the pregnancy registry for GARDASIL concerning a 18 year old female who on 20-JUN-2008, was vaccinated with the first dose of GARDASIL (Lot# 658558/1061U). The patient was pregnant when the vaccination was given (LMP was not reported). No symptoms were noted. The patient sought unspecified medical attention. Follow up information has been received from the program assistant, who reported that the baby girl was born prematurely on 12-JAN-2009 at 32 weeks of gestation. Birth weight was 4 lbs 3 oz. There was no mention of any birth defects. Preterm labor at 32 weeks was considered to be an other important medical event. The infant's experience has been captured in WAES 0807USA02217B1. No further information is available.

MedDRA PT Drug exposure during pregnancy, Foetal disorder, Premature labour

Symptom Text: Information has been received from a Program Assistant concerning a 7 month old female baby whose 18 year old mother was vaccinated IM on 20-JUN-2008 with 0.5 ml first dose of GARDASIL (Lot# 658558/1061U). Her LMP was not reported. Concomitant therapy included caffeine, citrated. The Program Assistant reported that on 12-JAN-2009, the baby girl was born prematurely at 32 weeks gestation. Birth weight was 4 lbs 3 ounces. The infant was on premature formula for some time and experienced colic, lactose sensitivity and spitting up (date unspecified). The baby was on caffeine, citrated at 1 month but no mention of when it was started. No birth defects mentioned. There was a non specific diagnosis at 9 months. The baby was being seen by neurologist for head control and eyes crossing in August 2009. The Program Assistant reported that she was not sure exactly when the shaken baby syndrome was discovered, however it was before August 2009 and she thought before 7 months of age. The first note about shaken baby syndrome was at the baby's 1 year check up. The baby had been hospitalized for 2 days (dates not provided) for brain damage related to the shaken baby syndrome. She also mentioned that the mother and baby come to the health department "or other services". Upon internal review, Baby was born prematurely at 32 weeks, on 12-JAN-2009 was determined to be an other important medical event. The mother's experience has been captured in WAES 0807USA02217. Additional information ahs been requested.

MedDRA PT Erythema, Oedema peripheral

Symptom Text: Information has been received from a physician concerning a 14 year old female with no concurrent condition or medical history who on 17-JUN-2010 was vaccinated with the first dose of GARDASIL (lot# NJ53440, batch # NK45930) into the left arm. Three days after vaccination (on 20-JUN-2010) the patient experienced oedema of left arm and erythema of left arm. The patient's mother was nurse, so she gave her daughter one tablet of DITHIADEN and symptoms disappeared till the next day (21-JUN-2010). The reporting physician stated that this event was medically significant. The reporter felt that oedema of left arm and erythema of left arm were related to therapy with GARDASIL. No further information is available.

MedDRA PT Hodgkins disease

Symptom Text: Information has been received from a registered nurse who heard from another person that during a support group meeting for parents with kids with Hodgkin's disease, a couple of mothers mentioned that their daughter received GARDASIL before being diagnosed with Hodgkin's disease. The patients sought unspecified medical attention. At the time of the report, the patients' outcome was unknown. The nurse was not sure how many patients were involved it was all hearsay. This is a hearsay report in the absence of an identifiable patient. Attempts to verify the existence of a patient have been unsuccessful. Upon internal review, "Hodgkin's disease" was determined to be an other important medical event. Additional information is not expected.

MedDRA PT Abdominal pain, Back pain, Balance disorder, Dizziness, Feeling cold, Flank pain, General physical health deterioration, Headache, Hyperhidrosis, Kidney small, Nausea, Night sweats, Pyrexia, Tenderness, Vomiting

Symptom Text: Information has been received from a Health Authority (reference # NO-NOMAADVRE-FHI-2010-10710) concerning a 13 year old girl who on 09-JUN-2010 was vaccinated with a third 0.5 ml dose of GARDASIL (batch number not reported, parenteral route of administration). Health Authority coded pain back, vomiting (vomiting twice), nausea, dizziness, flank pain, sweating (exceeded sweating at night), headache, abdominal pain (pain right flank), unsteadiness, feeling cold, reduce general condition, tenderness (arm tenderness) and fever. Onset for all events was 09-JUN-2010, hours after vaccination. Causality is possible for all events. The patient was hospitalized from 09-JUN-2010 to 11-JUN-2010. The patient was treated with PARACET (Manufacturer Unknown) and IBUX (Manufacturer Unknown). On 09-JUN-2010, the body temperature was 39.5 degrees C. On 10-JUN-2010, number of examinations were carried out: aspartate aminotransferase: 84 (no unit reported), alanine aminotransferase: 60 (no unit reported), urinalysis: urine stix negative, gamma-glutamyl transferase: 16 (no unit reported), kidney ultrasound: left kidney small for her age, 8 cm in diameter, body temperature: 38.1 degrees C up to 39 degrees C and C-reactive protein: 8-77. There was no suspicion of underlying causes to the observed symptoms. The patient still had pain right flank when discarded from the hospital, but no tenderness over the kidney lodgers. The outcome was recovered for all events, except for pain right flank. The case is close. Other business partner numbers include E2010-03958. No further information is available.

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Discomfort, Hypoaesthesia, No reaction on previous exposure to drug, Pain in extremity, Paraesthesia

Symptom Text: Information has been received from a physician concerning a 47 year old "transplant" female patient with allergy to gentamicin, alpha-1 anti-trypsin deficiency and a history of influenza vaccination in September 2009 who on 15-MAR-2010 was vaccinated IM with her first 0.5 ml dose of GARDASIL (lot #663559/1178Y), which was required in order to be put on the transplant list. Concomitant therapy included vitamin D (unspecified), PERCOCET, calcium (unspecified), multi vitamin, albuterol, SPIRIVA, "ALIST", tuberculin purified protein derivative (PPD) and ADVAIR. The patient did not have any problems after receiving the first dose of GARDASIL. On 08-JUN-2010, in the morning, the patient was vaccinated IM with her second 0.5 ml dose of GARDASIL (lot # 662765/0821Y) in her right arm. The patient had the impression that the nurse gave her the second dose of GARDASIL at a higher location than the location of the first dose. In the afternoon, the patient received PPD in her left forearm. On 08-JUN-2010 the patient experienced tingling and numbness of the entire right arm and pain on the entire right arm. It was pretty uncomfortable. The patient sought medical attention by an office visit and telephone calls. At the time of the report, the tingling and numbness persisted. No laboratory or diagnostic studies were performed. The reporting physician considered tingling, pain and numbness on the entire right arm to be disabling. Additional information has been requested.

Other Meds: PERCOCET; albuterol; calcium (unspecified); ADVAIR; SPIRIVA; tuberculin purified protein; vitamin D (unspecified); vitamins (unspecified)

Lab Data: None

History: Influenza immunisation

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Cervical dysplasia, Papilloma viral infection

Symptom Text: Information has been received from a physician concerning a female who on 05-SEP-2009 was vaccinated with the first dose of GARDASIL. On 05-MAR-2010 the patient was vaccinated with the third dose of GARDASIL 0.5ml syringe IM. Three month after vaccination, in June 2010, the patient took test pap smear and the test found high risk HPV NS2 and displasia. At the time of this report, the patient had not recovered. Additional information has been requested.

Other Meds: Unknown

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Abdominal pain, Migraine, Oculogyric crisis, Tremor

Symptom Text: Information has been received from an agency concerning a 14 year old female who on 23-APR-2010 was vaccinated IM with the 1st dose of GARDASIL through a public vaccination fund. In April 2010, after vaccination, the patient experienced abdominal pain. From April 2010 to JUNE 2010, the patient felt abdominal pain intermittently but without going to visit doctor. On 21-JUN-2010 the patient experienced tremor and oculogyric crisis and was hospitalized. The doctor diagnosed the patient with Abdominal Migraine and thought abdominal pain, tremor and oculogyric crisis were related to Abdominal Migraine and not related to therapy with GARDASIL on 23-JUN-2010. However, the parents felt abdominal pain, tremor and oculogyric crisis were related to the therapy with GARDASIL. The doctor treated patient with some medicine and the patient recovered from tremor and oculogyric crisis on 23-JUN-2010, but the abdominal pain still persisted. Follow-up call has been conducted on 30-JUN-2010. The patient was still hospitalized and the abdominal pain still persisted. No further information is available.

MedDRA PT Dizziness, Loss of consciousness

Symptom Text: Client had finished with the immunizations being given. He walked out of the exam room with his mother and stopped at the station to receive updated records when he told his mother that he was dizzy. He was hanging onto his mother when he passed out. He was assisted to the floor by both his mother and phn. Jacket was place under his head and feet were elevated in a chair. Ice pack was then applied to the back of his neck. After a few minutes, the dizziness cleared enough for client to sit up and place his back against the wall. He was given orange juice to sip on. He was then assisted up to sit in a chair. Once dizziness completly passed, client did stand at the chair. No dizziness reoccured and client with his mother did go out into the waiting room and again sat for another 10 minutes, then left the facility. Client was fully recovered.

Seriousness: ER VISIT, HOSPITALIZED, SERIOUS

MedDRA PT Back pain, Blood test, Headache, Influenza like illness, Menorrhagia, Pain

Symptom Text: Information has been received from a nurse practitioner concerning a 25 year old female with a history of caesarean section (about 3 years ago) and with no reactions/allergies who was vaccinated intramuscularly with three doses of GARDASIL (therapy start date was reported as July 2009 and third dose on in the middle of June). Concomitant therapy included PROVERA. After being administered GARDASIL in all three of her dosages, in July 2009 the patient experienced flu-like symptoms. She experienced pain in her body, back and had lingering headaches. She also bled profusely during her menstrual after being administered her third shot on approximately 15-JUN-2010. The patient went to emergency room (ER) on several occasions and had blood work done in the ER after being administered her first shot. The patient was hospitalized on an unspecified date. At the time of the report the patient had not recovered. Additional information has been requested.

MedDRA PT Adverse reaction, Pain, Pain in extremity, Similar reaction on previous exposure to drug

Symptom Text: My daughter had a severe reaction to her first GARDASIL injection, but she had a flu shot the same day, so we thought she was reacting to that....achy, burning pain up and down her arms and legs. 2 months later she had her second GARDASIL injection and had a similar, but more severe reaction. She begged me to cut her arms off because the pain was so bad, and she said that each arm felt like it weighed 1500 pounds! She is normally a pain-tolerant teenager and not whiny about a little pain, so I knew it was a major deal. We are not planning to get the 3rd injection, as I have no intention of seeing her go through that, or worse, again! Her symptoms only lasted 24 hours.

MedDRA PT Herpes zoster

Symptom Text: Information has been received from Health Authority under reference number: 2010-01832. A 15 year old female patient adolescent with no pertinent medical history reported who on 03-JUL-2008, received a first dose of GARDASIL (batch number and site of administration not reported), via intramuscular route. On 10-JUL-2010, one week after vaccination, the patient presented with shoulder and right shoulder blade herpes zoster. The outcome was favorable with 7 days of valacyclovir hydrochloride. The outcome was recovered on 17-JUL-2008. The literature search on line and in large data base did not reveal any association or relationship between the administration of GARDASIL and the occurrence of herpes zoster. Given the timelines, the imputability of GARDASIL in development of herpes zoster was possible. Health Authority consider as seriousness criteria as "other medically confirmed". Moreover, an inconsistency in the age of patient was identified as Health Authority has reported 15 years but in the narrative the age was reported as 17 years. A request was performed to clarify the age. Other business partner numbers include E2010-04050. No further information is available.

MedDRA PT Activities of daily living impaired, Pain, Pyrexia, Somnolence

Symptom Text: Initial information received by the foreign health authority (reference number ES-AGEMED-522493341) on 02-JUL-2010 regarding a 14 year old female who was administered on 30-APR-2010 a dose of GARDASIL (Lot number not reported), by intramuscular route (site of administration not reported). It was reported that on the same day of administration, on 30-APR-2010, the patient suffered fever, general body pain and somnolence. She recovered from fever and somnolence on the same day. She recovered from body pain one month later, on 30-MAY-2010. It was reported that the general body pain prevented her to do her usual physical exercise during that month. The health authority report, somnolence, general body pain and fever were coded. According to the health authority report, the patient took TERMALGIN, start and stop dates were not reported, to treat the fever. Case reported serious by the health authority with other important medical condition as criteria. Case is closed.

Seriousness: ER VISIT, PERMANENT DISABILITY, SERIOUS

MedDRA PT Facial palsy, Speech disorder

Symptom Text: Information has been received from a physician and a licensed practical nurse concerning a 12 year old female with attention deficit/hyperactivity disorder and no known drug allergies, who on 14-JUN-2010 was vaccinated with the first dose of GARDASIL (lot # 1487Y). Concomitant therapy included VYVANSE (for the attention deficit/hyperactivity disorder). No other vaccines were given on the day GARDASIL was administered. On 16-JUN-2010, the patient demonstrated symptoms of facial droop and impaired speech, so went to the ER (not admitted), and was diagnosed with bell's palsy made based on symptoms. No diagnostic testing was performed. The patient was ordered oral ACYCLOVIR, oral PREDNISONE, and ophthalmic erythromycin ointment for 10 days. The patient went to follow-up with an ENT physician (no details). The patient was seen in office on 21-JUN-2010 and 06-JUL-2010, and was still recovering. The event was considered disabling, but not life threatening by the licensed practical nurse. Additional information has been requested.

MedDRA PT Condition aggravated, Crying, Syncope, Unresponsive to stimuli

Symptom Text: Patient had a syncopal attack after administration of the HPV vaccine. She was unresponsive and was immediately placed in the supine position with legs raised and cold towels were placed on the head. She was aroused and was crying. She did not have a headache and did not vomit. She was observed for 15 minutes more and then was able to walk out of the office and was feeling alright.

MedDRA PT Breech presentation, Caesarean section, Drug exposure during pregnancy

Symptom Text: Information has been received from a physician's assistant for the pregnancy Registry for GARDASIL, concerning a female patient with no pertinent medical history or no known drug allergies, who on 10-APR-2009 was vaccinated with the first dose of GARDASIL (lot not reported). The patient was pregnant, her LMP was on 03-MAR-2009 (reported as 12 weeks and 6 days of gestation), her EDD: 08-DEC-2009. The patient underwent prenatal blood work (results not reported) and was taking prenatal medication. Follow up information has been received from a physician assistant who reported that the patient delivered a healthy female on 12-SEP-2009 at 37 +3 weeks EGA (estimated gestational age). The patient had had an unplanned primary cesarean section secondary to fetal breech position. The baby's Apgar scores were 8 and 9 at 1 and 5 min. respectively, and weighed 3089 grams. It was reported that the mother did fine postoperatively and fully recovered. Both she and the baby were discharged home together 2 days postpartum. The mother was seen in the office at 2 weeks postpartum for an incision-postpartum check and "everything was fine." Upon internal review primary cesarean section secondary to fetal breech position was considered to be as other important medical event. No further information is available.

MedDRA PT Drug interaction, Viral infection

Symptom Text: Information has been received from a consumer concerning her daughter a female who on 10-MAY-2010 was vaccinated with influenza virus vaccine (unspecified) and H1N1. During the vaccination the patient's father told to the nurse who was administering the vaccine that her daughter was supposed to receive the first dose of GARDASIL in the next month. However the nurse recommended the patient should take the vaccine on the same day and she did it. After reading the product label the patient's father considered that occurred a drug interaction between the vaccines. On approximately 10-JUN-2010 the patient experienced viral infection and was hospitalized. On approximately 13-JUN-2010 the patient was discharged from hospital fully recovered from viral infection. No further information is available.

MedDRA PT Abortion spontaneous, Drug exposure before pregnancy, Foetal disorder

Symptom Text: Information has been received from an investigator concerning a female who entered a study. The patient was vaccinated with GARDASIL. After study discontinuation the patient became pregnant. The patient experienced a spontaneous abortion. The fetus had malformations (thumbs pointing inwards). The mother of the patient contacted the investigator and expressed concerns that the abortion and malformations may be due to the vaccination in the trial. The investigator did not express any opinion whether the abortion and malformation were related to vaccine. Additional information has been requested.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Atrial septal defect, Developmental delay, Drug exposure during pregnancy, Echocardiogram normal, Failure to thrive, Foetal distress syndrome, Gastrooesophageal reflux disease, Neonatal tachycardia, Premature baby, Weight gain poor

Symptom Text: Information has been received from a physician, for the Pregnancy Registry for GARDASIL, concerning a male baby's 24 year old mother with anxiety and depression and no known allergies who on 15-OCT-2007 was vaccinated with the first dose of GARDASIL. On 14-JAN-2008 she was vaccinated intramuscularly with the second 0,5 ml dose of GARDASIL (lot no. 659055/1522U). Concomitant therapy included WELLBUTRIN. Her LMP was 07-JAN-2008. Due date was 13-OCT-2008. On approximately 17-AUG-2008 the mother delivered a baby boy "at around 32 weeks gestation, almost two months early". The physician did not remember exactly and did not have the patient's chart at her immediate disposal. The physician also followed the baby in her practice. The physician reported "he was now around nine months old and weighed around 15 pounds. He had some failure to thrive issues and had some developmental delays". No further information was provided at this time. Follow-up information received from the physician concerning that the mother had experienced prolonged premature rupture of membranes and was given intravenous PITOCIN and steroids for the baby since less that 34 weeks gestation. The baby had fetal distress in labor which the physician thought was not surprising given the age and loss of amniotic fluid, but she delivered vaginally on 27-AUG-2008, at 32+2 weeks gestation (her EDD was 13-OCT-2008). The baby had a patent foramen ovale, "which is now almost gone", and tachycardia for which he was followed by a pediatric cardiologist. "We are not worried about this though", The most concerning problem the baby had was his weight gain. The physician saw him in Mid-Jun and he only weighed 15LBS, and he was having some reflux problems for which he was sent to a pediatric gastroenterologist. The physician read from a form that the pediatric gastroenterologist consult dated 19-Mar-2009 which noted the baby was seen for his atrial-septal defect/patent foramen ovale, which was almost gone, and he had a normal echocardiogram, with recommended followed

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Convulsion, Dyskinesia, Fall, Immediate post-injection reaction, Loss of consciousness, Nausea, Presyncope

Symptom Text: Information has been received from an office staff member and a physician concerning a 15 year old male patient with no pertinent medical history and no known drug allergies/drug reactions and family history of epilepsy who on 15-JUL-2010 was vaccinated with the first dose of GARDASIL (Lot # 0450Z). It was reported that immediately after receiving GARDASIL the patient experienced jerking movements of four limbs and loss of consciousness which lasted 30-60 seconds. The patient then returned to normal with vague nausea and the patient did not know what happened. The office staff member stated that the patient had his blood pressure taken and his vital signs were fine and the patient was able to go home. The physician confirmed that on 15-JUL-2010 the patient received the first dose of GARDASIL and did not received any concomitant vaccinations. The physician reported that immediately after the patient received the vaccine, the patient fell back and had most likely a short seizure along with a vasovagal response. When the patient regained consciousness he was not postictal but felt nauseous. There were no laboratory diagnostic tests performed. At the time of the report the patient had recovered (on therapy). Upon internal review most likely a short seizure was determined to be an other important medical event. Additional information has been requested.

MedDRA PT Aggression, Grand mal convulsion, Muscle twitching, Myoclonus, Staring

Symptom Text: Information has been received from the father of a now 16 year old female patient who in the fall 2007 began series of GARDASIL which was completed in June 2008. By November 2008, the patient developed twitches in her large muscle, not specified to any muscle (random). On 03-May-2010, the patient hit a boy in the nose. The patient saw a neurologist. At the time of the report the patient's outcome the relation between twitches in her large muscle, hit a boy in the nose and GARDASIL were unknown. Follow up information has been received from the physician who reported that the patient with no preexisting conditions, in June 2008, was vaccinated intramuscularly with the third 0.5 ml dose of GARDASIL in the school. There was no concomitant medication. On an unspecified date, (reported as "5/12"), "after GARDASIL", the patient began developing generalized tonic clonic convulsion or myoclonic jerking with staring episodes. In November 2008, the patient experienced aggressive behavior/hit a boy in the nose. On 01-DEC-2008, the patient experienced twitches in her large muscles. At the time of the report the patient's outcome and the relation between twitches in her large muscle, aggressive behavior/hit a boy in the nose, generalized tonic clonic convulsion or myoclonic jerking with stirring episodes and GARDASIL were unknown. Generalized tonic clonic convulsion was considered to be an other important medical event. No further information is available.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abortion induced, Drug exposure before pregnancy, Urinary tract infection

Symptom Text: Information has been received from a physician and gynecologist's office manager, for GARDASIL, a Pregnancy Registry product, concerning an 18 year old female patient with no known drug allergies, who on 22-APR-2009 was vaccinated intramuscularly with the first dose of GARDASIL (lot # not available). On 28-JUL-2009, the patient received the second dose of GARDASIL (lot # not available). In August and September 2009, the patient experienced urinary tract infections. On 23-NOV-2009, when the patient went to receive her third dose, she found out she was pregnant. A urine beta-human chorionic gonadotropin test was performed. The third dose was not given. The patient was referred to a gynecologist. The gynecologist's office manager reported that on 16-DEC-2009, the patient had a therapeutic abortion. The reason for the elective procedure was not specified in the chart. This was the patient's first pregnancy. Last menstrual Period was on 05-OCT-2009. There were no serious criteria (patient "in and out"). The outcome was unknown, as the patient did not return for follow up visit. Additional information has been requested.

Other Meds: Unknown

MedDRA PT Asphyxia, Death, Drug exposure via breast milk

Symptom Text: Information has been received from a physician concerning a 6-8 week old patient whose 25 year old mother on 29-JUL-2009 (conflicting information, also reported as two days post-partum) was vaccinated with her first 0.5 mL dose of GARDASIL (lot# 660391/0063X) in her left deltoid, (it was noted that she was not pregnant when she received the first dose). The patient was breastfeeding. On 31-JUL-2008 the patient's mother was breastfeeding her infant and she fell asleep. Subsequently, the infant died from suffocation and was found in the morning. It was ruled as a smothering injury: "overlay compression asphyxia, mother laid over child". The reporting physician felt that the patient's death was not related to vaccination with GARDASIL. A standard lot check investigation was performed. All in-process quality checks for the lot # 660391/0063X were satisfactory. In addition, an expanded lot check investigation was performed. The testing performed on the batch prior to release met all release specifications. The lot met the requirements of the Center for Biologics Evaluation and Research and was released. The mother's experience has been captured in WAES# 0809USA04046. Additional information has been requested. This report was previously sent to the FDA on 30-SEP-2008 (WAES# 0809USA04046) and was previously split to create a baby report.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Congenital inguinal hernia, Drug exposure during pregnancy

Symptom Text: Information has been received from a health care professional under the reference number RA-102-2010 and transmitted by the agency. Case linked with the case E2009-10048 (corresponding to mother case, WAES #0910USA04217). A male baby whose mother had received the first and second doses of GARDASIL (batch number not reported) on 30-APR-2009 and 30-JUN-2009 presented an inguinal hernia. The mother became pregnant in July 2009 (exact date not provided). The health care professional reported that a male baby was born on 09-APR-2010. Everything went well during the delivery, mother and baby were in good health conditions. One month after delivery he presented an inguinal hernia and needed to be submitted to a surgery. Inguinal hernia was considered to be a congenital anomaly. The outcome was recovered. The case was closed. Other business partner numbers include E2010-04243.

MedDRA PT Abortion missed, Drug exposure during pregnancy, Haemorrhage

Symptom Text: Information has been received from a physician for a of GARDASIL a pregnancy registry product, concerning a 17 year old female with convulsion who in approximately July 2009, was vaccinated with the second dose of GARDASIL (Lot # unknown). Concomitant therapy included DEPAKOTE. The physician reported that the patient had received the second dose of GARDASIL. In late May 2010, the patient became pregnant and subsequently, at 8 weeks gestation, experienced bleeding and missed abortion, at which time she visited the emergency room. The physician stated it was unclear if the patient was still on DEPAKOTE during the pregnancy. The reporting physician considered the events bleeding and missed abortion to be other important medical events. Additional information has been requested.

Other Meds: DEPAKOTE

Seriousness: LIFE THREATENING, SERIOUS

MedDRA PT Grand mal convulsion, Loss of consciousness, Syncope

Symptom Text: Information has been received from a physician concerning a 13 year old female with pollen allergy who on 14-APR-2009 was vaccinated with a first dose of GARDASIL. On 14-APR-2009 the patient experienced syncope. The patient quickly returned to consciousness. On 16-JUN-2009 the patient was vaccinated with a second dose of GARDASIL. On 16-JUN-2009 the patient experienced toniclonic convulsion and loss of consciousness. Return to consciousness was slow lasted from 0.5 to 1 minute. Subsequently, the patient recovered from syncope, toniclonic convulsion and loss of consciousness. The reporter felt that syncope, toniclonic convulsion and loss of consciousness were related to therapy with GARDASIL. Toniclonic convulsion and loss of consciousness were considered to be immediately life-threatening. Toniclonic convulsion and loss of consciousness were considered to be an other important medical event by the physician. Additional information is not expected.

MedDRA PT Cold sweat, Dizziness, Pallor

Symptom Text: After receiving her 1st HPV, TDAP, Varicella and MCV4, patient asked if she could wait in waiting room for the 15 min time frame (post HPV shot protocol). I said yes. As she was walking out, someone yelled for me as pt became very clammy, pale, & started to faint. (see attached for rest). Pt sat in chair nearby and put head btw her legs. Given juice. Moved back to room with bed & had her wait 15 more minutes. Given more juice and crackers. Left at 1610 PM feeling & looking much better.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Dizziness, Dyskinesia, Malaise, Moaning, Respiratory rate increased, Vomiting

Symptom Text: Pt counseled about HPV vaccine and consented to injection. Has never received HPV vaccine in the past. No known drug or vaccine allergies. Reported she sometimes feels faint around needles. Pt counseled about side efects including possible pain at insertion site and possibility of feeling faint. Written info given. MA gave injection and after approximetly 20 sec pt stated she felt dizzy and her eyes began to widen. At that point MA brought me back in the room where I was there with the patient and her brotehr and patient was lying on the table making jerking movements of extremities and moaning. I immedietly had the front desk call for an ambulance. After about 1 -2 minutes the patient began to stop moaning and movements ceased. She was breathing heavily but was able to speak and said she felt sick. Her breathing then started to slow to a normal pace and after about another minute she vomitted into a bucket. After about 7 minutes paramedics came. Pt was able to walk to the stretcher with assistance. BP was 93/60. Pt denies any hx of seizure activy, but states she has fainted after vaccinations in the past. Pt brought the emergency room for evaluation. Possible adverse reaction to GARDASIL submitted to the FDA adverse reaction reporting system.

Other Meds: Pt was on Fluoxitine 10 mg daily

Lab Data: BP after sycopy tonic-clonic 93/60

History: No known drug allergies

Seriousness: LIFE THREATENING, SERIOUS

MedDRA PT Chemotherapy, Hodgkins disease, Injection site pruritus, Lymphadenopathy, Mass, Pruritus

Symptom Text: Vaccination administered 1/16/08, despite argument with PA and LPN about not getting it (and being told I "may already have the virus," so I should get the vaccination; they obviously believed it was a cure instead of preventative) Severe itching appeared a few weeks after the initial vaccine. Injection site itched slightly after the vaccine was administered, and continued to spread to legs, hips, and buttocks). Itching felt as if it were coming from the inside (subcutaneous). Noticed lumps along collarbone (left side) and went to physician. After a number of physicians, received chest x-ray and needle biopsy, followed by an excisional biopsy, which diagnosed me with Hodgkin's Lymphoma, stage 2A. Treatment: Six months of ABVD chemotherapy (treatment occurred Thursdays, every other week from 06/24/08 to 12/04/08). Patient has been free of symptoms since December 2008. The following information was obtained through follow-up and/or provided by the government. 08/12/10. PCP visits on 01/16/08-06/08/09. On 06/03/09, Pt reported having Hodgkin's disease, unspecified and lymphadenopathy. Also, Pt reported having received chemotherapy and became clean of Hodgkin's disease in 12/08. ROS was negative.

Other Meds:

Lab Data: Needle biopsy 5/2008 Excisional biopsy 5/21/2008 (positive for Hodkin's Lymphoma) Bone marrow biopsy 5/29/2008 (no presence of cancer in bone marrow; therefore, stage 2A) Various pulmonary function tests, etc. The following information was

History: Penicillin allergy. The following information was obtained through follow-up and/or provided by the government. PMH: bcp, varicella, MRSA, Streptococcal septicemia, family h/o CA. Allergies: PCN rash.

Prex Illness: No illness at time of vaccination.

MedDRA PT Drug exposure during pregnancy, Flank pain, Premature labour, Uterine contractions during pregnancy

Symptom Text: Information has been received from a consumer concerning her daughter, a 14 year old female who on 08-AUG-2008 was vaccinated with the first dose of GARDASIL, 0.5 mL, intramuscular, The caller stated that when her daughter received the first dose of vaccination she was 2 months pregnant. On 14-OCT-2008, the patient received the second dose of GARDASIL. Caller did not mention any adverse event. It was unknown if the patient sought medical attention. Additional information has been received from a consumer concerning her daughter, who "delivered really early and the baby died after it was born." The consumer stated her daughter was almost five and a half to six months pregnant and she started having pains in her side, went to the doctor and was told everything was ok and went home. The next week her pains started again and then felt like contractions, and when she went to the doctor she was already dilated around four or more centimeters and they couldn't stop her contractions. The consumer reported that the baby was born and then died (No further details provided). It was reported that the consumer's daughter had good days and bad days. The baby's experience is reported in WAES 0810USA02499B1. Upon internal review, preterm delivery was determined to be an other important medical event. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Grand mal convulsion, Immediate post-injection reaction, Loss of consciousness, Syncope

Symptom Text: Information has been received from a physician concerning a 12 year old female who on 21-JUL-2010 was vaccinated with a first dose of GARDASIL (lot # 659964/1978U), intramuscularly. The patient fainted before the dosage was completed. She got tonic clonic seizure. The patient recovered on the same day. Follow-up information received from a nurse practitioner and licensed practical nurse indicated that the patient had come to the physician's office for her annual physical. On 21-JUL-2010 she was vaccinated with a first dose of GARDASIL (lot # 659964/1978U) and with a dose of HAVRIX (lot # AHAVB427AA). The licensed practical nurse stated that after she had administered the two vaccinations the patient fainted and had seizure that lasted about 20 to 30 seconds. The patient regained consciousness and had recovered. After the incident, the patient waited in the physician's office for one hour and then went home with her mother. The patient did not have a past medical history of seizures and did not have a family history of seizures. Upon internal review tonic clonic seizure was determined to be an other important medical event. Additional information has been requested.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Diarrhoea, Haematemesis, Haematochezia, Nausea, No reaction on previous exposure to drug, Stool analysis, Vomiting

Symptom Text: Information has been received from a pharmacist concerning a 17 year old girl who on 13-JUL-2010 was vaccinated with her second dose of GARDASIL. Concomitant therapy included chloroquine for malaria. Within 1/2 hours after vaccination, the patient began to suffer from severe nausea, vomiting and diarrhea. The patient also had blood in her stools and hematemesis. Because of the severity of the events, the patient went to the hospital (the pharmacist did not know if the patient had been admitted or stayed in the emergency room). Stool testing was done for infectious component (results are pending). The patient had no reactions though following administration of the first dose. It was reported that the patient visited a country a few weeks ago. The pharmacist cannot rule out the possibility of a possible relationship between the events and the vaccine because of the temporal relationship. On 14-JUL-2010, the pharmacist heard back from the patient's mother. The patient had returned home and was feeling better. The patient had improved a little but was still suffering from the afore-mentioned. Additional information has been requested.

Seriousness: ER VISIT, EXTENDED HOSPITAL STAY, HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Hypoaesthesia, Mood altered, Muscular weakness, Sick relative

Symptom Text: Information has been received from a physician concerning a 14 year old female patient with no allergies, birth defects or medical conditions who on 30-APR-2010 was vaccinated IM with a first dose of GARDASIL (lot number: 662299/1099Y). On 01-JUL-2010, the patient was vaccinated IM with a second dose of GARDASIL (lot number: 661758/0968Y) (expiration date: 29-JUN-2012) in the left deltoid. There was no illness at the time of vaccination. On 08-JUL-2010 the patient experienced weakness and bilateral numbness in her lower extremities and upset. The patient was hospitalized from 08-JUL-2010 to 09-JUL-2010 (overnight observation) and discharged from the hospital. The patient left the hospital walking. Multiple, unspecified laboratory tests were performed. On 09-JUL-2010, the patient recovered and she had seen the physician the day after her discharge. The physician stated that the patient's father had a viral infection and she was not sure if the patient's symptoms could have been related to a viral infection exposure. No additional information is expected.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Migraine with aura, Vaccine positive rechallenge

Symptom Text: Information has been received from a medical consultant for pension office concerning a 18 year female patient who was vaccinated with a second dose of GARDASIL (lot# not reported) on 18-APR-2007. Concomitant medication included hormonal contraceptives (unspecified). Two weeks post vaccination the patient experienced migraine accompanee. Despite ongoing symptoms the patient was vaccinated with a third dose of GARDASIL (lot# not reported) on 17-DEC-2007. Three to four weeks post vaccination the patient developed aggravated migraine accompagnee. Up to the time of reporting unspecified therapy was not successful. At the time of reporting the patient had not recovered. First dose of GARDASIL was given on 31-JAN-2007 and was well tolerated. The reporter assessed the relation to the vaccine as probably. Follow up information has been received from a Health Authority on 16-JUL-2010 (ref. # PEI2010019740). Case was assessed serious from agency, therefore this case was upgraded. Symptoms started about one or two weeks after second dose and reoccurred aggravated 14 and 26 days after third dose, respectively. CT, MRI and cerebrospinal puncture were carried out and showed normal results. The patient had not recovered. Agency coded: migraine accompagnee. The event of migraine accompagnee was considered to be an other important medical event by the Health Authority. Other business partner numbers include E2010-04073. No further information is available.

Other Meds: hormonal contraceptives (unspecified)

Lab Data: computed axial tomography, normal results; magnetic resonance imaging, normal results; spinal tap, cerebrospinal puncture, normal results

MedDRA PT Bruxism, Dizziness, Dreamy state, Gaze palsy, Hyperhidrosis, Loss of consciousness, Miosis, Moaning, Pallor, Tremor

Symptom Text: After vaccines administered, patient said she felt dizzy. Within seconds patient passed out, eyes rolled in head and teeth clenched on a lollipop she was eating. Patient started to moan, and came to after 15-20 seconds. Color very pale, sweaty, shakey, pupils pinpoint. Upon patient coming around she said she felt like she had a dream. She knew her name and where she was. I elevated her feet and got a cool compress to her head. She drank 10 oz of ginger ale and sat for 20 minutes while her color returned to normal and she said she was feeling much better. Mom said her daughter gets weak at the sight of blood. After 20 minutes 1 had her sit for 10 more minutes with her feet down before being driven home by mom. Patient said she felt almost like herself. I followed-up and called mom's cell phone 90 minutes later and she said patient ate all her lunch and was doing fine. I advised mom to keep a good eye on her and keep activity minimal for the day. Asked to call own DM if symptoms worsened. Vitals: 98/72 right after fainting, 80/56 2 minutes later, 104/68 10 minutes Pulse 76. 108/66 just prior to going home

MedDRA PT Dizziness, Loss of consciousness

Symptom Text: Case received from a health care professional in a foreign country on 20-JUL-2010 and additional information on 23-JUL-2010. Case medically confirmed. An 18 year old female patient with a medical history of neurodermatitis, had received the first dose of GARDASIL (batch # NH38400, lot # 1400U) in the upper arm on 11-NOV-2009 and one day later she "saw stars", everything went black and she developed dizziness. Since that time dizziness lasted for 6 months and occurred gradually. Neurological and ENT examinations revealed no pathological findings. Laboratory test showed normal results except for iron deficiency. The patient received corrective treatment with unspecified homeopathic medication. Final outcome was unknown. Because of the long duration of symptoms the reaction was considered as serious by the reporter. Dizziness and saw stars, everything went black were considered to be other important medical events. Concomitant medication included hormonal contraceptives (unspecified). The second dose of GARDASIL (batch # NH38400, lot # 1400U) was given on 06-JAN-2010, toleration was not reported. The patient refused the third dose of GARDASIL. The patient was a smoker. The reporter considered the causal relation as unlikely. File closed. Other business partner numbers include E2010-04344.

Other Meds: hormonal contraceptives (unspecified)

Lab Data: neurological examination, no pathological findings; ears, nose, and throat examination, no pathological findings; diagnostic laboratory test, normal, except for iron deficiency

History: Neurodermatitis

Seriousness: LIFE THREATENING, SERIOUS

MedDRA PT Angioedema, Circulatory collapse, Condition aggravated, Face oedema, Hypotension, Rash pruritic, Syncope

Symptom Text: Information has been received from an agency via a case line listing via CSL, as part of business agreement, concerning a 12 year old female patient who on 23-MAR-2010 was vaccinated with a 0.5 ml dose of GARDASIL (batch# NK30260, lot# NJ29410) (dose number not reported). On 23-APR-2010, less than 1 month after vaccination, the patient developed rash pruritic, angioedema, circulatory failure and hypotension. It was reported that the patient woke acutely with a hot rash and facial oedema and collapsed getting out of bed. When seen in hospital she was in circulatory collapse with hypotension. It was noted that the patient had a similar episode about 4 months previously (approximately 23-DEC-2009) (predating GARDASIL vaccination by 3 months), for which no cause was found. Immunology clinic review was undertaken, but all tests were negative and the aetiology of these episodes remained unknown. At the time of this report, the patient had recovered from rash pruritic, angioedema, circulatory failure and hypotension. The reporter felt that rash pruritic, angioedema, circulatory failure and hypotension were unlikely related to therapy with GARDASIL. Rash pruritic, angioedema, circulatory failure and hypotension were considered to be immediately life-threatening. A lot check has been initiated. Additional information has been requested.

Other Meds: Unknown

MedDRA PT Completed suicide, Death

Symptom Text: Information has been received from the agency via a Case Line Listing via CSL, as part of a business agreement, concerning a 15 year old female patient with a history of depression who on 25-MAY-2010, was vaccinated with the second 0.5 ml IM dose of GARDASIL (batch # NK20450, lot # NJ29430). On 28-MAY-2010, within one week following vaccination, the patient experienced suicide (severe) and died. The cause of death was suicide. The agency felt that suicide was unlikely related to therapy with GARDASIL. No further information is available. A lot check has been initiated. This was originally reported by a practice nurse.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Asthma, Convulsion, Drug exposure during pregnancy, Ear infection, Ear tube insertion, Pyrexia, Speech disorder

Symptom Text: Information has been received from a mother concerning her approximately 2 year old son. In February 2007 and April 2007, the mother with migraine and polycystic ovarian syndrome was vaccinated with the first and second doses of GARDASIL 0.5 mL (lot # not reported), respectively. Concomitant therapy included vitamins (unspecified). Two weeks after receiving dose 2, the mother found that she was two months pregnant. On 13-FEB-2010, the baby was delivered. Subsequently the baby experienced an unexpected fever almost every other day as well as seizures. The baby was also congested all the time and was diagnosed with asthma. At about 6 months old (in approximately August 2007) the baby experienced "a lot of ear infections" and the mother finally switched pediatricians. The pediatricians never referred the baby to an ENT, nor did they suggest tubes in his ears. The baby had tubes placed in his ears about a month or so ago by his new pediatrician, and his speech had really improved a lot- "he was doing much better with that". Now the baby was still having problems with seizures through not as often and his mother thought he was getting much better. The mother felt that seizures, unexplained fever, asthma and "a lot of ear infections" were related to therapy with GARDASIL. Upon internal review, th event of seizures was considered to be an other important medical event. The mother's experiences were captured in WAES# 0904USA01551. Additional information has been requested.

Seriousness: ER VISIT, HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Brain operation, Convulsion, Depression, Epilepsy

Symptom Text: Information has been received from a consumer concerning her 17 year old daughter with no known drug allergies who in October 2007, was vaccinated with a first dose of GARDASIL. There was no concomitant medication. The patient's mother also mentioned how terrible GARDASIL had been in ruining her daughter's life. A few days after receiving the first shot, the patient fell into a deep depression. In January 2008 the patient received a second dose of GARDASIL and at that point the patient fell into an even deeper depression and began having seizures. In June 2008 the patient received a third dose of GARDASIL and apparently at that point she became a full blown epileptic. On an unspecified date the patient was hospitalized (length of stay and hospital demographics not provided); the patient sought unspecified medical attention. It was also reported that the patient has had brain surgery twice. At the time of the report, the patient had not recovered. No laboratory or diagnostic studies were performed. The health professional contacted during telephone follow-up could not supply the following information: dates of vaccination, dose number, lot number, date of event, recovery status, hospital name, and other healthcare provider name and contact information. The health professional stated that the GARDASIL vaccinations were in fact given at their office, but at earlier dates than reported by the consumer. The reporter considered the events "fell into deep depression", "became a full blown epileptic", "how terrible GARDASIL had been in ruining her daughter's life" and "began having seizures" to be disabling. Additional information has been requested.

MedDRA PT Convulsion, Tremor

Symptom Text: Information has been received from a physician concerning a 20 year old female who on 21-JUN-2010 was vaccinated with the first dose of GARDASIL (Lot # unknown). The patient was also vaccinated with a dose of hepatitis A virus vaccine inactivated (manufacturer unknown), in the same office visit. The physician reported that at the day of vaccination, on 21-JUN-2010, the patient experienced seizure-like symptoms (including arm shaking). At the time of reporting, the patient had recovered. The patient did not seek medical attention. Upon internal review, seizure-like symptoms were considered to be other important medical event. Additional information has been requested.

MedDRA PT Amnesia, Contusion, Dizziness, Fall, Head injury, Laboratory test, Loss of consciousness, Syncope

Symptom Text: Information has been received from a physician and a medical assistant concerning a 23 year old female patient with no medical history and reported as "free of heart murmur" who on 19-JUL-2010, was vaccinated with the first dose of GARDASIL (Lot # 0450Z). There was no concomitant medication. It was reported that after the vaccination, the patient was instructed to wait in the reception area. Then she went back to the exam area and while standing up, "about 10 minutes" after she had received GARDASIL, she felt dizzy, fell back, fainted and hit her head. The physician stated that she was not sure but the patient may have had a seizure. She also stated that she heard the patient fall and when she went to the reception area the patient was unconscious, on the floor sitting up. According to the medical assistant, the patient was unconscious for less than a minute. The patient had bruised her head (specific area not specified). The physician called the patient's name and she regained consciousness immediately and recovered. It was mentioned that the patient had a brief period of amnesia, when she stood up she was coherent. The patient was taken to the treatment room and was given water. The time from the GARDASIL to the time the patient went to the treatment room was about 15 minutes. The patient remained in the physician's office for one hour and a half, before she went home with her mother. She was sent to the emergency room to rule out head injury and had other screenings (unspecified). The patient had an electrocardiogram (EKG) performed which results were abnormal; she was not admitted to the hospital. The patient was referred to a cardiologist. Upon internal review the patient may have had a seizure was considered another important medical event. Additional information has been requested.

MedDRA PT Grand mal convulsion

Symptom Text: Case reported by Health Authority (case n. 120772) through (local case n. IT343/10). Initial report received on 22-JUL-2010. An 11 year old female was vaccinated on 28-JUN-2010 with the first dose of GARDASIL (batch number NL31800, lot number 1353X). On the same day she presented with tonic-clonic convulsions that lasted a few minutes, the patient did not have any pre-existing neurological lesions and was apyretic. She was treated with NOAN. The outcome is recovered on 28-JUN-2010. HA coded tonic-clonic convulsions. The event was reported as not serious by both the reporter and HA upgraded to serious by Company upon internal review. Upon internal review, clonic-tonic convulsions was considered to be an other important medical event. Other business partner numbers included: E2010-04430.

Seriousness: ER VISIT, LIFE THREATENING, SERIOUS

MedDRA PT Convulsion, Resuscitation, Tonic clonic movements

Symptom Text: Information has been received from a registered nurse concerning a female teenager, who in approximately September 2009 ("fall 2009") was vaccinated with a dose of 0.5 ml GARDASIL (lot #, injection site and route unspecified). When the patient was given GARDASIL, she had "a seizure with tonic clonic movements" and she "coded". They called 911 and she was revived and recovered "immediately after it happened". Therapy with GARDASIL was discontinued and not reintroduced. The nurse considered the "seizure with tonic clonic movements" to be immediately life-threatening. Reporter also stated that "this event has already been reported to the CDC and VAERS and it has been determined to be unrelated to GARDASIL." No further information is available.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Breath sounds abnormal, Condition aggravated, Gaze palsy, Immediate post-injection reaction, Loss of consciousness, Malaise, Tonic clonic movements

Symptom Text: Information has been received from a Health Authority (HA) (reference numbers PA20100226, PA1000232) concerning a 16 year old female patient with a history of varicella and vagal malaise who received the first dose of GARDASIL (batch number not reported) by intramuscular route on 11-JUN-2010. Ten seconds after injection, the patient felt sensation of malaise with loss of consciousness followed by tonic clonic movements, eye revulsion and noisy breathing. Neither loss urine nor tongue bite were reported. The crisis lasted approximately 30 seconds. The patient was hospitalized on an unspecified date. Blood pressure before crisis was 100/70 and 95/60 after crisis. Sidelying position was placed and the patient remained seated. Then minutes after, when she was still sitting, similar crisis occurred. The patient was taken to the emergency department where electrocardiogram was performed. As results were normal, the patient was discharged that day. On 18-JUN-2010 no crisis occurred again. Further check up i.e cerebral MRI and cardiology consultation pending. The HA had coded the events: "loss of consciousness" and "tonic clonic movements". The HA assessed the causal relationship between the reported reactions and vaccination as "possible" (C2S2I2) according to the method of assessment. Other business partner numbers include: E2010-04392. No further information is available.

MedDRA PT Musculoskeletal pain, Pain, Pain in extremity

Symptom Text: Case received from a health care professional on 08-JAN-2010. It was reported by a gynecologist that a 16 year old female patient received a complete series of three doses of GARDASIL (D1: lot # 1050U, batch # NH32140; D2 lot # 1695U, batch # NH25730; D3: lot # 1285U, batch # NH35150) intramuscular, into the left upper arm on 29-JUN-2009, 03-SEP-2009 and on 04-JAN-2010. Since 30-JUN-2009 the patient complained of intermittent pain in left arm especially while moving it. Despite ongoing symptoms she was vaccinated with D2 and D3 of GARDASIL. For some time (not otherwise specific) the patient also developed pain in right hand. The medical familial history included rheumatoid arthritis by the patient's mother and grandmother. Follow up information has been received. The case was initially reported as non serious and was upgraded to serious upon internal review (due to other important medical event). The reporter was contacted by phone. Several unspecified examinations revealed diagnosis of rheumatism. At the time of reporting the patient showed no symptoms. The case is closed. Other business partner numbers include E2010-00111. No further information is available.

MedDRA PT Amnesia, Anxiety, Disorientation, Dizziness, Fall, Hyperhidrosis, Immediate post-injection reaction, Loss of consciousness, Nausea, Pallor, Tachycardia

Symptom Text: Administered HEP A & MCV in pts. right arm & then proceeded with HPV in left arm. Immediately after withdrawing the needle, pt. stated she felt dizzy & passed out. Patient's mom and I were in the room and patient, who was seated on the exam table, fell back against the wall. Her mom and I lowered her into a lying position and Dr. came into the room. Patient regained consciousness in less than 30 seconds but was disoriented and said she did not remember anything after saying she felt dizzy. Patient continued to lie down with mom in the room. A wet washcloth was applied to patient's forehead. Patient was pale, diaphoretic, and tachycardic. She was later complaining of nausea. She did not vomit. After approximately 25 minutes, patient sat up on the exam table. She was apprehensive that she would faint again. Patient was able to walk out of the clinic approximately 40 minutes after the fainting episode.

Seriousness: HOSPITALIZED, PERMANENT DISABILITY, SERIOUS

MedDRA PT Alopecia, Androgenetic alopecia, Asthenia, Blood pressure systolic decreased, Bronchitis, Chronic sinusitis, Condition aggravated, Dizziness, Fatigue, Headache, Heart rate increased, Infection susceptibility increased, Laryngitis, Loss of consciousness, Menstruation irregular, Migraine, Muscular weakness, Nasopharyngitis, Nausea, Orthostatic intolerance, Pain, Pallor, Performance status decreased, Photosensitivity reaction, Sinusitis, Syncope, Thirst, Tonsillitis, Vertigo, Weight fluctuation

Symptom Text: Information has been received from a Health Authority (reference # PEI2010019668). Case medically confirmed. To be noted that the medical letters/hospital reports contain ambiguous, not always congruent information, particularly concerning the beginning of migraine symptoms. A 13 year old female with a medical history of menstrual bleeding in 2006 and administration of hormonal contraception (unspecified) for one year had received the first dose of GARDASIL (lot # 1401F, batch NG00010) in the left upper arm on 21-DEC-2007 and with a second dose of GARDASIL (lot # 1114U, batch NH10940) in the left upper arm on 14-AUG-2008. Since beginning of 2008 she developed relapsing syncopes and a decreased performance status and since July 2008 frequent infections (laryngitis, bronchitis, tonsillitis, and common colds). After the second vaccination physical and mental performance furthermore aggravated. In September 2008, she presented to a dermatologist with hair loss. On 11-SEP-2008, alopecia androgenetica was diagnosed. On 19-NOV-2008, the patient presented to an outpatient department for pediatric psychosomatics. An integrated therapy recommended. Since January 2009, the patient presented to a general practitioner who prescribed homeopathic medication due to dizziness, syncopes, fluctuation of weights, regularly occurring pain, chronic fatigue, photosensitivity and headache. Cytomegalovirus and hepatitis A, B and C were excluded. From 12-FEB-2009 to 18-FEB-2009, the girl was hospitalized. Family history revealed depression and epilepsy of the patient's father. According to the mother the patient generally eats few. At that time the patient had a weight of 58.6 kg and a height of 163 cm. By clinical investigation of the symptoms (with an increased thirst in addition), including EEG (electroencephalogram), ECG (electrocardiogram) and abdominal sonography, following diagnoses were excluded: diabetes insipidus, hypothyroidism, epilepsy, ocular diseases, heart diseases. Endocrinal diagnostics (thyroid values and cortisol) show

MedDRA PT Alpha 1 foetoprotein, Amniocentesis, Amniotic fluid volume decreased, Anaemia, Caesarean section, Cardiac stress test, Drug exposure during pregnancy, Foetal distress syndrome, Laboratory test, Ultrasound scan

Symptom Text: Information has been received from a certified medical assistant, for GARDASIL, a Pregnancy Registry product, concerning a 17 year old female with no pertinent medical history reported and no known drug allergies who on November 2008, August 2009 and 11-DEC-2009 was vaccinated intramuscularly with the first 0.5 mL, second 0.5 mL and third 0.5 mL dose of GARDASIL (LOT# first dose 659180/1758U, second dose 659964/1978U and third dose 663453/0249Y), respectively. There was no concomitant medication. The patient was found to be pregnant since the pregnancy urine test was positive. No adverse effect was reported. The date of the last menstrual period was in October 2009, the estimated date of delivery is in July 2010. Follow-up information was received which reported that the female with no previous pregnancies or births and was pregnant, and the estimated conception date was possibly 09-NOV-2009. The date of the last menstrual period was in October 2009, the estimated date of delivery is 08-AUG-2010. The Maternal serum-alpha-fetoprotein (MSAFP) and amniocentesis was performed by obstetrician/Gynecologist (OB/GYN) and no results were reported. Follow-up information was received which provided specified dates of the first dose and second dose. It was noted the first dose of GARDASIL was received on 14-NOV-2008 and the second dose on 12-AUG-2009. Follow-up information was received which reported that the female during entire pregnancy time period was taking prenatal vitamins, daily for prenatal care and SLOW FE, daily for anemia. During pregnancy/delivering, the patient had complication of low amniotic fluid and fetal distress (had captured in NWAES # 1001USA03408B1). Obstetric labs, ultrasound and fetal stress test were performed and outcomes were unknown. On 20-JUL-2010, at LMP of 38 weeks the patient through C-section delivered a normal male infant, weight "5 pounds 1.6 ounce" and length 19.5 inches. Upon internal review, C-section was considered to be an other important medical event. The infant's experience had cap

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Dizziness, Dyspnoea, Eye irritation, Eye pruritus, Pruritus, Rash erythematous

Symptom Text: Information has been received from a physician concerning a female patient with yeast allergy who on an unspecified date was vaccinated with a first dose of GARDASIL (Lot# unknown). The physician reported that the patient experienced itching after receiving GARDASIL. The patient sought unspecified medical attention. At the time of the report, the patient had recovered from itching (date unknown). Therapy with GARDASIL was discontinued. Follow up information has been received from a physician concerning a 22 year old female patient with yeast allergy who on 23-MAR-2010 was vaccinated with a first dose of GARDASIL (Lot # 662765/0821Y, expiry date 25-JUN-2011), IM in the left deltoid. On 24-MAR-2010 at 2:00 am the patient experienced rash (red itchy), shortness of breath, lightheadedness, dizziness, and itchy/burning eyes. The physician stated that on 30-MAR-2010 the patient recovered. The patient sought medical attention. The reporting physician considered rash (red itchy), shortness of breath, lightheadedness, dizziness, and itchy/burning eyes to be other important medical events. Additional information is not expected.

Seriousness: PERMANENT DISABILITY, SERIOUS

MedDRA PT Abdominal pain, Abnormal behaviour, Aggression, Amenorrhoea, Antisocial behaviour, Apathy, Back pain, Decreased activity, Depression, Disturbance in attention, Dysphagia, Eating disorder, Educational problem, Fatigue, Headache, Hypersomnia, Influenza like illness, Lethargy, Malaise, Medical diet, Mood swings, Muscular weakness, Nausea, Neuropathy peripheral, Oedema peripheral, Pain in extremity, Paraesthesia, Pyrexia, Sensation of heaviness, Tremor, Vomiting

Symptom Text: Information has been received from the agency via a Case Line Listing via CSL, as part of a business agreement, concerning 16 year old patient who in September 2009 was vaccinated with a first IM dose of GARDASIL (lot # not reported). Since receiving the first dose of GARDASIL the patient had been unwell, she had a sore arm, slept a lot, headaches, flu-like symptoms, severe mood swings, was antisocial and became amenorrhoeic. On 13-Nov-2009 the patient was vaccinated IM with a second 0.5 ml dose of GARDASIL (lot# NJ02680, batch# NJ46520). A week following vaccination with the second dose of GARDASIL, the patient's arm became "dead" heavy and very weak, with paresthesia. over the months the parent's diary reported that her daughter had continuing extreme, headaches, concentration problems, back and abdominal pain, swollen fingers and shaking left hand. She also became aggressive and difficult to deal with. School performance declined and behavior in general became out of character. The patient had been a keen sportswoman and had lost all motivation to participate. In the patient's diary were documented fluctuations in spectrum of symptoms which largely referred to behavior, motivational issues as well as headache, back pain and arm paraesthesias, but had also included new symptoms such extreme fatigue, fevers, depression, nausea, vomiting and difficulty eating and swallowing certain types of food. The diary documented the events until 20-MAY-2010. It was reported that "other factors" included "nutritional supplements". In January 2010 the patient was placed on therapy with citalopram (PO) and metoclopramide (PO), for an unknown indication. At the time of the report, the patient had not recovered. The agency did not classify the relationship between neuropathy, headache, concentration impaired, behaviour abnormal and lethargy to vaccination with GARDASIL. The agency considered the events of neuropathy, headache, concentration impaired, behaviour abnormal and lethargy to be disabling. This was originally reported by

MedDRA PT Convulsion, Similar reaction on previous exposure to drug

Symptom Text: Information has been received from a nurse at the physician's office concerning a 14 year old female patient who on an unknown date was vaccinated with the first dose of GARDASIL (lot # and route not reported). On an unspecified date the patient received the second dose of 0.5 ml GARDASIL intramuscularly (lot # not reported). Concomitant therapy was not reported. After getting the second dose of vaccine the patient experienced seizure like reaction. The nurse also reported that the patient had a similar reaction after the first dose as well. The patient had sought medical attention and had recovered from the seizure like reaction "after stopping therapy". Upon internal review, seizure like reaction is considered to be an other important medical event. Additional information has been requested.

MedDRA PT Loss of consciousness

Symptom Text: Case received from the Health Authority on 28-JUL-2010 under the reference case number ES-AGEMED-722539241. Case medically confirmed. A 15 year old female patient, 35 kilograms with a medical history of fainting-fits had received an injection of GARDASIL (batch number not reported) via intramuscular on 02-JUL-2010 on the same day, latency the patient experienced a loss of consciousness. Examination performed on 02-JUL-2010, showed an arterial pressure of 121/67 mmHg. The patient recovered on the same day, on 02-JUL-2010, within a few seconds. In the HA's report only faint was coded. Case reported serious by health authority with other medically important condition as criteria. Case is closed. Relevant Test/Laboratory data: Diastolic BP: 67 mmHg. Systolic BP: 121 mmHg. Other business partner numbers included E2010-04525. No further information expected.

MedDRA PT Colitis ulcerative, Condition aggravated, Diarrhoea haemorrhagic, Large intestinal ulcer

Symptom Text: Information has been received from a consumer under the reference number RA-104-2010 on 16-JUL-2010 and transmitted by agency. A 13-year-old female patient had received the first dose of GARDASIL (LOT # NJ49350, batch # NL30780) on 08-APR-2010 and the second dose (batch #, site of administration and route not reported) on 27-MAY-2010. Two days after the administration of the first dose, the patient experienced diarrhoea with blood and she had visited the emergency room. She was treated with SALOFALK 250 and a colonoscopy with biopsy was done to search for ulcerative colitis. The colonoscopy showed several ulcers but the results from the biopsy were not conclusive. Four days after the administration of the second dose, the patient experienced again diarrhoea with blood but for a shorter period of time. The patient has been followed in the gastroenterology medical visit and a visit to the doctor was planned on 20-JUL-2010. The patient's medical history was not reported and previous reaction to other drugs was unknown. The outcome was recovered. Follow-up information received on 27-JUL-2010: Case medically confirmed (on 27-JUL-2010). The gastroenterologist reported that the results of the second colonoscopy and biopsy confirmed a diagnosis of ulcerative colitis and the patient was still medicated with mesalamine. According to the gastroenterologist, the event was not related with the administration of the vaccine. The patient had recovered and will be followed in the pediatrics medical visit. For the moment, no more information was provided regarding the administration of the third dose. Upon internal review ulcerative colitis was considered medically significant. Other business partner numbers included: E2010-04460. No further information is available.

Other Meds: Unknown

MedDRA PT Fatigue, Hypoaesthesia, Injection site pain, Muscular weakness, Paraesthesia, Photophobia, Polyneuropathy, Sensation of heaviness, Sensory disturbance, Vomiting, Weight decreased

Symptom Text: Case received from a pharmacist on 28-JUL-2010. Case medically confirmed. An 18 year old female patient had received the first dose of GARDASIL (Batch # not reported) in the arm on 25-JUN-2010. On 27-JUN-2010 ie 2 days later, she experienced pain at the site of injection, with heaviness and numbness of the vaccinated arm. She also experienced tingling in the fingers and the toes. 4 days after vaccination, the patient experienced vomiting for 4 days, resulting in a weight loss of 3 kg. Fatigue, muscular weakness in the legs then in the arms, sensation of absence and eye discomfort to light were also reported with no specified date of onset. Electromyogram was performed and polyradiculoneuritis was diagnosed. The pharmacist suggested possible diagnosis of Guillain Barre Syndrome. The patient started corrective treatment with prednisone on 28-JUL-2010 to be discontinued on 02-AUG-2010. Brain MRI was to be performed in mid August 2010 due to sensation of absence and discomfort to light. The reporting pharmacist considered the adverse events to be other important medical events. Other business partner numbers included E2010-04529. No further information is available.

MedDRA PT Fall, Feeling hot, Head injury, Loss of consciousness

Symptom Text: Clt given five vaccinations as listed below, following administration of vaccine clt. stated she felt OK. Clt and parent left mobile clinic and when outside in parking lot while trying to get into vehicle; clt "passed out" and fell to ground and sister stated she had hit back of head. Clt mom then brought clt back into mobile and I assessed clt was alert and oriented to person, place, time. Clt stated she felt hot. Fire dept was called and assessed clt and gave parent ok to take clt home and seek medical attention if mental status alters. Parent called on 8/5/10 at 11:30 and stated clt "doing much better today". Clt did not need to seek medical attention.

MedDRA PT Activities of daily living impaired, Dizziness, Feeling abnormal, Feeling cold, Listless, Loss of consciousness, Pallor, Presyncope, Vomiting

Symptom Text: Information has been received on 23-FEB-2009 from a Health Authority concerning a 14 year old female patient who on 15-JAN-2009 was vaccinated with a dose of GARDASIL (lot #, batch # not reported) by intramuscular route. On 16-JAN-2009, one day after vaccine administration, the patient had lost consciousness, presented with vomiting, pallor, vasovagal crisis, sensation of cold and dizziness. It was reported that by the 23-JAN-2009 the patient had recovered. The health authority considered vasovagal reaction to be other important medical event. Other business numbers partner numbers include E2009-01640 and ES-AGEMED-2200771341. A corrective version has been created on 10-MAR-2009 in order to correct the start dates of vasovagal reaction and sensation of cold and correct the recovery date. Upon internal review on 04-AUG-2010, the case E2009-01829 was identified as a duplicate. This case (E2009-01829) was considered as the reference case (the oldest one). Number in series, unit dose, action taken with a drug were corrected. Vasovagal reaction was changed to vasovagal attack. As per consolidation date, this case was updated with the follow up information provided in case E2009-01829. It was reported that on the 16-JAN-2009, a day after vaccination, the patient began to feel bad, on the 17-JAN-2009; the patient was taken to the emergency room where she lost consciousness after having experienced dizziness, pallor, cold sensation and vomiting. According to the adverse event box of the report, all the adverse events (except "feel bad" that was not included in the adverse event box, i.e. it was not coded) started on 16-JUN-2009. The patient was sent home with a diagnosis of possible vasovagal attack. The patient did not attend school during that week due to feeling dizzy and listless. Case reported as serious by the HA with other medically important condition as criteria. It was reported that the patient recovered by the 23-JAN-2009. Outcome from feel bad was not reported. Other business partner numbers included E2009-01

Symptom Text: Per mother of child, patient felt faint and dizzy upon leaving clinic. That evening around 5:00 pm, patient fainted when with Uncle. Family did not seek medical attention and states patient was fine after fainting. Mother noticed on 8/11/10 that patient had a knot on right tricep at injection site with some swelling. Applied heat pack to site. Bicep and tricep continued to swell and red band appeared around bicep and tricep on 8/12/10. Red rash around injection site on right tricep appears to be size of silver dollar per mother of child as of 8/12/10. Mother states patient had low-grade fever on 8/11/10 and treated with Tylenol. Mother of child states the injection site is not have pus or drainage and only appears to have swelling and redness. Instructed mother of child to follow up with doctor.

MedDRA PT Cervical conisation, Cervical dysplasia, Cervix carcinoma stage 0, Chlamydia test negative, Human papilloma virus test negative

Symptom Text: Case received from a gynecologist on 16-JUL-2010. Case medically confirmed. A 20 year old female patient was found to have PAP IIId in January 2010 after receiving a complete vaccination series with three doses of GARDASIL IM into the upper arm in 2007 when she was approximately 16 years old. On 03-MAY-2010 she was found to have PAP IVa. HPV test and smear for Chlamydia and other infections were negative. On 01-JUN-2010 conisation was performed. History showed CIN II of squamous epithelium (resection in sano) and molecular pathologic test was again negative for HPV. The patient recovered within an unspecified time. Follow up information has been received on 06-AUG-2010. Corrective version. Upon internal medical review the case was upgraded to serious (cervical conisation considered as invasive treatment/other medically important event). File is closed. Case was linked with E2010-04305 (WAES # 1008USA00076). Other business partner numbers included E2010-04302. No further information is available.

MedDRA PT Convulsion, Dizziness, Nausea, No reaction on previous exposure to drug, Pain, Pyrexia, Vomiting

Symptom Text: Information has been received from a health professional and the patient's mother concerning a 15 year old female patient who on 01-JUN-2010, was vaccinated with the first dose of GARDASIL (lot # NJ37220, Batch NK51050). No adverse effect followed this vaccination. On 30-JUL-2010, the patient was vaccinated with the second dose of GARDASIL (lot # NJ37220, Batch NK51050, route not reported). In the same day as vaccination, 30-JUL-2010, the patient developed fever, 39 degree C for five days and nausea. Later on the patient vomited (in July 2010), the patient felt dizzy and experienced feeling of convulsion in body and body pain (specific dates of onset in August 2010 not reported). On 04-AUG-2010, the patient visited the doctor for investigation. There was no signs of infection and the SR was normal. It was considered that the symptoms were related to GARDASIL. case medically confirmed. On 05-AUG-2010, the patient felt better for the first time. The patient's outcome was recovering. The case was reported as non serious by the patient's mother and HCP. After medical revision by the company, the case was considered to be upgraded to serious as other important medical event. The case is closed. Other business partner included E2010-04590. No further information is available.

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Abdominal pain upper, Headache, Lymphadenopathy, Malaise

Symptom Text: Information has been received from a consumer concerning her 15 year old daughter with no known drug reactions/allergies and no known medical history who in August 2009 and in October 2009, was vaccinated with the first and second dose of GARDASIL, respectively. Concomitant therapy included amitriptyline hydrochloride (MSD). In 2009, "a few months after the second dose", the daughter began experiencing headaches. Magnetic resonance imaging (MRI) was conducted (results not reported). The mother mentioned that the doctor who began treating her daughter with the headaches suggested she should not get the third dose and the consumer decided not to. At the time of reporting, the outcome of headaches was unknown. The patient sought unspecified medical attention. Follow up information was received from a physician's assistant who reported that on 17-JUL-2009 and 27-OCT-2009, the 14 year old (also reported as 15 year old) patient was vaccinated with the first and second dose of GARDASIL, respectively. There was no illness at time of vaccination. On 03-NOV-2009, the patient experienced headaches constant, generally feeling unwell, swollen glands and stomach aches. The patient was seeing a neurologist and headache specialist. A MRI was performed which showed normal results. At the time of reporting, the patient was not recovered. Headache constant, generally feeling unwell, swollen glands and stomach aches were considered to be other important medical events due to requiring medical/surgical intervention by the reporter. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abortion induced, Drug exposure during pregnancy

Symptom Text: Information has been received from a licensed nurse practitioner, for GARDASIL, a Pregnancy Registry product, concerning a 24 year old female pregnant patient (last menstrual period was 15-JUN-2010) with no known drug reactions, allergies or pertinent medical history who on 09-JUL-2010 was vaccinated IM with a first dose of GARDASIL (lot number 663559/1178Y). The nurse reported that an urine pregnancy test was performed but the positive pregnancy indicator was so light that it was missed and the dose of GARDASIL was given. No known adverse effects were reported. Estimated delivery date is 25-MAR-2011. Follow up information has been received from the nurse practitioner who reported that the patient decided to electively terminate the pregnancy. The nurse reported that the patient would be having the procedure done on 05-AUG-2010. The nurse also reported that the termination was not vaccine related. The nurse reported that the patient "just did not want the pregnancy". At the time of the report that patient's outcome was unknown. Upon internal review "the patient decided to electively terminate the pregnancy" was considered to be an other important medical event. No further information is available.

Other Meds: Unknown

MedDRA PT Activities of daily living impaired, Dizziness, Gait disturbance, Hypokinesia, Muscle spasms, Myalgia, Nausea, Oedema peripheral, Pain, Panic attack, Presyncope, Syncope, Vaccine positive rechallenge, Visual impairment

Symptom Text: Information has been received from a physician concerning a 15 year old female who on 10-SEP-2007 was vaccinated intramuscularly in the upper arm with her first dose of GARDASIL (Lot # 1539F; Batch NF42170). On 10-NOV-2007, also reported as 2 months after the first dose, the patient experienced myalgia (duration not reported). On 12-NOV-2007, the patient was vaccinated intramuscularly in the upper arm with her second dose of GARDASIL (Lot # 0354U; Batch NF58150). On 31-MAR-2008, the patient was vaccinated intramuscularly in the upper arm with her third dose of GARDASIL (Lot # 0510U; Batch NG20180). On approximately 21-APR-2008, also reported as "about 3 weeks post vaccination" of the third dose, the patient complained of myalgia of both thighs on exertion which occurred immediately after "presyncopal events" with dizziness and nausea. These "attacks" relapsed several times. On 30-APR-2008, the patient consulted an outpatient neurological department. Physical examination showed normal results. No measures were taken. As symptoms were ongoing, the patient was hospitalized on 07-MAY-2008 for clarification. During the physical neurological examination, the patient complained of pain in both thighs and reduced movements of both legs. An MRI of spine, cranial MRI and cerebrospinal fluid showed normal results. Laboratory tests, including "BSR" (see lab data section) showed normal findings. Serology for Borrelia showed "questionable positive result for IgM", IgG was negative. Antibodies against enterovirus, varicella zoster virus, CMV and HSV were all negative for blood and CSF. On 09-MAY-2008, the patient was discharged from the hospital. At the time of reporting she had not yet recovered. The reporting pediatrician assessed a causal relation between the adverse event and dose 1 and dose 3 vaccinations as "possible". The second dose of GARDASIL dose 2 was well tolerated. Follow-up information was received on 21-AUG-2008 which reported that the patient recovered from presyncope, nausea and dizziness, but she is still suf

MedDRA PT Dyspnoea

Symptom Text: Information has been received from a registered nurse concerning a 12 year old female patient with no pertinent medical history who on an unknown date was vaccinated with her first dose of GARDASIL. About 6 hours after receiving her first dose of GARDASIL, the patient developed shortness of breath. She went to the Emergency Room but was not admitted to the hospital. No specific treatment was given. The patient had gone to two different doctors and was still experiencing symptoms. The reporting registered nurse considered "shortness of breath" to be an other important medical event due to visit to the Emergency Room. No further information is available.

MedDRA PT Back pain, Dysmenorrhoea, Fatigue, Headache, Hypersomnia, Hypoaesthesia, Injection site pain, Menorrhagia, Muscle spasms, Nausea, Pain in extremity, Photophobia, Rash, Tremor, Vomiting

Symptom Text: These are the following symptoms that she has complained of since getting the shot. Not all of them are every day but she's had them throughout this past winter and now: Fatigue-especially after exertion ie: tennis, phyed, snowmobiling, wakeboarding, snowboarding, she's been checked for anemia, ekg, mono, liver test, kidney test, blood counts etc.. all come back normal. It is hard to wake her during some of these episodes. She doesn't want to drive, instead tends to sleep in car if it's more than a 20 minute ride. Headaches in the last month have been most everyday now. Vomiting- when not "feeling right" as she puts it she will vomit once and then will sleep alot. Light sensitivity- was complaining of this when she'd walk out of school also says her vision is worse. Stomach gets very nauseous and sometimes cramping pain. Shaky at times then feels better later. Gets a rash that comes and goes on her chest. Complained of arm hurting and burning for a few days after the shot. Back ache and leg pain. Cramping more with periods, periods are very heavy, which she was put on the pill in Feb. for. About a month ago she had an episode at mass that her fingers/hand was numb. The feeling did come back though.

Other Meds:

Lab Data: She also got the Menectra shot and chicken pox shot on the same day as her first Gardasil shot. The following blood test have been done and all are in normal range except Vitamin D which was at 26. Celiac Panel, Lyme Disease, Comprehans

Seriousness: ER VISIT, NOT SERIOUS

MedDRA PT Feeling abnormal, Loss of consciousness, Pallor, Resuscitation, Syncope

Symptom Text: Information has been received from a physician concerning an 11 year old female patient who on 26-JUL-2010 was vaccinated intramuscularly with a 0.5ml dose of GARDASIL (lot# 663559/1178Y). Vaccination on the same date also included a dose of VAQTA (MSD) (lot# not reported), a dose of MENACTRA and a dose of ADACEL. On 27-JUL-2010 the patient passed out and was pale and lifeless. The patient's father performed CPR and took her to the Emergency Room. At the time of this report, the patient had recovered. The patient's events were considered to be other important medical events by the reporter because the patient's father performed CPR. Follow-up information has been received from a medical assistant in the physician's office. The MA reported that the 11 year old female was with concurrent condition of asthma and was allergic to SEPTRA and AUGMENTIN. The patient on 26-JUL-2010 was vaccinated with VAQTA (MSD) (lot# 667262/0245Z), MENACTRA (lot# U3089AA) and ADACEL (lot# U3042CA). Concomitant therapy included albuterol inhaler. Onset of the event was the day after the vaccines were administered. On 27-JUL-2010 the patient was at home and passed out. The father performed CPR, although not needed. The patient was taken to Emergency room. Unknown what diagnostics were performed or what treatment was given. No further information is available. The following information was obtained through follow-up and/or provided by the government. 8/26/10 ER records and labs and diagnostics received for date of service 7/27/10. Dx: Syncope. Presented to the ER after a syncope episode lasting 20-30 seconds. Discharged in stable, improved condition.

Other Meds: albuterol

Lab Data: Unknown The following information was obtained through follow-up and/or provided by the government. 8/19/10 Received medical records w/LABS: Neutros 80.2%(H), lymphs 13.6%(L). CT head & EKG WNL. 8/26/10 ER records and labs and diagnostics

MedDRA PT Cervical dysplasia

Symptom Text: Information has been received from a physician concerning a female who in approximately December 2009 completed her schedule vaccine, she was vaccinated with GARDASIL 3rd dose. In February 2010, the patient experienced cervical intraepithelial neoplasia. The reporter referred previously Papanicolaou test were normal. Approximately in February 2010 was performed a colposcopy that reported as NIC 1, following was performed a biopsy (with four samples) that reported as NIC 1 and finally a cervix conization was performed that reported as NIC 3. The causality and outcome were reported as unknown. Upon internal review that cervical intraepithelial neoplasia was considered as cancer and other medical event. After several attempts we couldn't to contact the physician to obtain more information. No further information is available.

MedDRA PT Guillain-Barre syndrome, Loss of control of legs, Muscular weakness, Paraesthesia

Symptom Text: Information was obtained on request by the Company from the agency via a public case details form concerning a 12 year old female who on 24-MAR-2010 was vaccinated with a dose of GARDASIL (lot # NJ02690, batch # NJ47920). Suspect therapy on 24-MAR-2010 included RECOMBIVAX HB (thimerosal free, lot # 666571/1597Y, batch # N3850) and VARILRIX (lot # reported as A70CB394A). 4 weeks post vaccination, on approximately 21-APR-2010 the patient had pins and needles in her legs and was feeling weak and her legs kept collapsing from under her. The patient was admitted to hospital and diagnosed with Guillain-Barre syndrome. FI-LP and MRI were normal. Electrophysiology test was not conducted. The patient was treated with physiotherapy. At the time of the report, the outcome was unknown. The agency considered that the events were possibly related to therapy with GARDASIL. The original reporting source was not provided. Additional information is not expected.

MedDRA PT Hypoaesthesia

Symptom Text: Initial case was received on 28 July 2010 from a healthcare professional. An 11 year old female received on 13 August 2009, a left deltoid intramuscular injection of ADACEL (reported lot number U29133 AA not valid for ADACEL, but is valid for MENACTRA), a right deltoid intramuscular injection of MENACTRA (lot number U2919AA) and a right deltoid intramuscular injection of GARDASIL (Merck lot number 1130X). The patient experienced numbness in both arms and legs since the vaccinations (onset date and time not specified). The patient had no pre-existing medical conditions, no concomitant medications and no known allergies. On 28 July 2010, the patient returned to the physician's office for an annual exam, reported the numbness and stated the symptoms continued. Document's held by sender: None. The following information was obtained through follow-up and/or provided by the government. 8/23/10 Received vaccine & PCP medical records for service dates 7/23/10 Assessment: Records reveal patient experienced numbness in extremities intermittently 3-4 x for 1 year starting 1-2 days after 1st vaccination in 8/09. Parent refused remainder of series. Exam WNL. Had been referred to Endocrine after abnormal TSH/T4.

Other Meds:

Lab Data: The following information was obtained through follow-up and/or provided by the government. 8/23/10 Received medical records w/LABS done 9/21/09: TSH 6.06(H), T4 0.89(L). MRI brain WNL.

History: The patient had no pre-existing medical conditions, no concomitant medications and no known allergies.

MedDRA PT Back pain, Hemiparesis, Injection site swelling, Pain, Swelling, Swelling face

Symptom Text: Initial case received from a physician on 14 July 2010. A 16-year-old female patient received a right arm injection of MENACTRA (lot number U34400AA) and a left arm injection of GARDASIL (Merck, lot not reported) on 13 July 2010. The patient had a history of ADHD (attention deficit/hyperactivity disorder) and depression, and 8 months prior to vaccination had suffered a head trauma with symptoms involving the right side. Concomitant medications included PRISTIQ, VYVANSE, and PAMELOR. On 14 July 2010, the morning after vaccination, the patient woke up with swelling of the right side including right-sided facial swelling and right arm swelling; right-sided weakness; and lower back pain. The patient noted that she had pain when trying to get up to walk, and that she "hurt all over". She was seen by her physician on 14 July 2010. Outcome was unknown at the time of the report.

Other Meds: PRISTIQ; VYVANSE; PAMELOR

Lab Data:

History: History of head trauma 8 months prior to vaccination with similar right sided-symptoms. Past medical history also included depression and ADHD; she had no known allergies.

MedDRA PT Anxiety, Blood pressure decreased, Blood test, Bradycardia, Convulsion, Dehydration, Electrocardiogram, Fall, Gaze palsy, Injection site anaesthesia, Injection site discomfort, Muscle twitching, Nausea, Postictal state, Syncope, Tachycardia

Symptom Text: Information has been received from a consumer concerning her 13 year old son with no known drug reactions or allergies or pertinent medical history who on 06-AUG-2010, was intramuscularly vaccinated in the left arm with the first dose of GARDASIL, in the physician office. There was no concomitant medication. On 06-AUG-2010, following the administration of GARDASIL, the patient walked to the waiting room to sit with his mother. Within two or three minutes the patient fell to the ground seizing. The seizure activity lasted approximately three minutes. Emergency medical service was called because of sustained tachycardia and low blood pressure. It was noted that this resolved with a lengthening of the postictal phase of the seizure. The patient was then transported to the emergency room by his mother where blood work and electrocardiogram were performed (results not provided). The patient was then discharged to his home. According to the patient's mother he was currently very anxious. "Patient fell to the ground seizing", sustained tachycardia, low blood pressure and very anxious were considered to be disabling and life-threatening by the reporter. Additional information has been requested. The following information was obtained through follow-up and/or provided by the government. 08/30/10. PCP visit and ER report for 08/06/10. Pt fell after receiving multiple immunizations, c/o RA numbness, twitching, Pt's eyes rolled back. Pt had discomfort at injections site. Pt also had nausea, brief bradycardia, decreased blood pressure. Tx: IVF. DX: syncope, dehydration. Pt improved and discharged in stable condition.

Seriousness: HOSPITALIZED, SERIOUS

MedDRA PT Arthralgia, Fatigue, Pyrexia, Systemic lupus erythematosus

Symptom Text: Information has been received from a physician concerning her 12 year old female daughter with a history of flu who in approximately September 2008, was vaccinated with first dose GARDASIL. Second and third dose were received on approximately December 2008 and approximately March 2009 respectively. Concomitant therapy included influenza virus vaccine (unspecified) and pneumococcal vaccine (unspecified). In September 2008, the patient initially complained of ankle joint pains. Upon inspection, ankles were not swollen. The ankle pains were described as "going on and off" as it appeared and disappeared spontaneously. Aside from ankle pains, the patient also complained of tiredness or fatigue. Subsequently, the patient experienced fever of unknown origin. After 2 weeks, the patient was hospitalized for a month and was diagnosed with lupus. The patient's lupus persisted and is now undergoing laboratory tests to check for complications on the heart and kidneys. The reporter felt that lupus was probably related to therapy with GARDASIL. It was noted that the patient did not have a family history of auto-immune disease and was other wise healthy prior to vaccination. This is one of two reports from the same source. Additional information is not expected.

Symptom Text: Information has been received from a physician concerning her 15 year old daughter with no pertinent medical history or drug allergies who in September 2009, was vaccinated with a first dose of GARDASIL (lot # not reported). No concomitant medications were reported. It was reported that in September 2009, very soon after the injection of GARDASIL, the patient developed fatigue and nausea. When the patient was on leaving the physician's office she experienced syncope. The patient began having symptoms of high fever, headache and sore muscles. The patient was lethargic for months after she received GARDASIL. In June 2010 the patient had chest pain and went to the Emergency Room where she was diagnosed with anxiety. The EKG showed arrhythmias. The patient became weak and had to quit the Track Team at school. In June 2010 the patient was tired and lethargic and began to forget things. Approximately three weeks ago, in approximately August 2010, the patient developed a tremor in her left hand and she was unable to speak. The patient developed chronic seizures with chorea. On 08-AUG-2010 the patient was admitted to hospital. On 15-AUG-2010 the patient developed a stroke and was non verbal. The patient was diagnosed with drug induced systemic lupus erythematous with chorea. It was reported that there was central nervous system (CNS) involvement and the patient had vasculitis of the brain. The physician did not report what type of diagnostic testing the patient had received. The patient was being treated with ten different medications reported as follows: intravenous immune globulin (IVIG), antibiotics, anti hypertensive medications due to kidney involvement and high doses of IV prednisone. The physician stated that today, on 17-AUG-2010, the patient was to begin chemotherapy with IV cytotoxin for a duration of 24 hours. Currently, the patient had her voice back and was able to move all of her extremities except the left arm. As of 16-AUG-2010 the patient had not recovered from drug induced systemic lupus erythematosus w

MedDRA PT Feeling cold, Flushing, Skin warm, Thirst, Throat tightness

Symptom Text: Flush skin, tightness in throat. Client received vaccine at approximately 11:25 am after checkout, returned to front counter at approximately 11:45 am and reported to the Office Manager that she was experiencing tightness in her throat. Office Manager came to the back to inform this nurse. This nurse returned to the front and brought the client to the back. The client was alert and oriented, reporting a tightness; upon swallowing. Upon assessment client throat appears normal; client was able to swallow actually asking for water. Skin was flush in appearance and very warm to touch. No respiratory distress noted. BP was 118/68 @ 11:50 am. RN was alerted to initiate protocol. Client received BENADRYL 50 mg IM at 12n, BP: 106/60. At 12:05 pm EMS was alerted due to client reporting no change in status. BP: 120/20. Client reports feeling "cold" and "very thirsty". At 12:10pm BP: 130/90 and client remains alert and oriented - attempting to call husband. Client in semi-fowler's position with cool cloth on neck cover with drapes for warmth. At 12:15 pm, BP: 120/94. At 12:20 pm EMS arrived and took over care of client. BP: 125/79, client reports no change in status since receiving BENADRYL 50 mg IM. Client departed on stretcher via ambulance to hospital at 12:25 pm. This nurse called client at 4:45 pm. Client answered cell phone and reported that she was doing well and went home with no other problems, about twenty minutes after receiving IM Epinephrine in Emergency Room.

MedDRA PT Caesarean section, Chorioamnionitis, Drug exposure before pregnancy, Foetal heart rate disorder, Immunoglobulin therapy, Labour complication, Pyrexia

Symptom Text: Information has been received from a medical assistant for GARDASIL, a Pregnancy Registry product, concerning an 18 year old female patient with type O Rh(D) negative blood and a history of 1 pregnancy and 1 elective termination who on 05-AUG-2009 was vaccinated with the first dose of GARDASIL (lot# 662404/0312Y). Concomitant therapy included prenatal vitamins (unspecified). Subsequently, the patient became pregnant. Her LMP was 15-SEP-2009. On 11-NOV-2009, ultrasound done for viability and dates, result showed intrauterine pregnancy (IUP) seen approximately 13 weeks. The patient's estimated date of delivery was 19-MAY-2010 and the baby was normal. At the time of the report, the patient's outcome was unknown. Follow-up information has been received from a medical assistant who reported that on 09-DEC-2009 serum alpha-fetoprotein screening was performed for routine pregnancy test, with normal result. It was also reported that the patient's blood type is O negative. The patient also had one previous pregnancy which she electively terminated at 11 weeks gestation. At the time of the report, the patient's outcome was unknown. Follow-up information has been received which reported that the patient did not agree to participate in the Pregnancy Registry for GARDASIL. Follow up information has been received from the physician who reported that the patient was admitted to the hospital with the pre-operative diagnosis: Intrauterine pregnancy at: 40w 6d, chorioamnionitis, protracted labor, nonreassuring fetal heart rate tracing (NRFHT); Post-operative Diagnosis: status post delivery of VMI, normal pelvic anatomy, same. The patient was seen prior to surgery (Primary Low Transverse Cesarean Section). The risks, benefits, complications, treatment options, and expected outcomes were discussed with the patient. The patient concurred with the proposed plan, giving informed consent. The site of surgery properly noted/marked. A Time Out was held and the above information confirmed. While the patient was being prepped, the FHT were

Other Meds: vitamins (unspecified)

Lab Data: ultrasound, 11/11/09, normal, IUP seen approx 13 1/2 weeks; serum alpha-fetoprotein, 12/09/09, normal; hemoglobin, 05/26/10, 11.8; hematocrit, 05/26/10, 33.5

History: Termination of pregnancy - elective

Prex Illness: Pregnancy NOS (LMP = 9/15/2009); Rhesus antibodies negative

MedDRA PT Carcinoma in situ, Cervical dysplasia, Loop electrosurgical excision procedure, Neoplasm malignant

Symptom Text: Information has been received from a physician concerning a 22 year old female patient who was vaccinated with three doses of GARDASIL in the physician's office in 2007. It was reported that the patient now had cancer. She visited the physician's practice within the last 3 week, in approximately July 2010, and was presented with cervical dysplasia, abnormal Pap smear, positive HR-HPV, biopsy came back as carcinoma in situ (CIS). She had the loop electrosurgical excision procedure (LEEP). At the time of the report, the patient's outcome was unknown. Upon internal review, carcinoma in situ (CIS) was determined to be an other important medical event. This is one of several reports received from the same source. Additional information has been requested.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Initial and following up information has been received from a physician and a medical assistant, for GARDASIL, a Pregnancy Registry product, concerning a 20 year old female patient with irregular periods, with a history of car accident (a few years back) and subsequently with an addiction to pain medications, who on 27-JUL-2010 was vaccinated IM with the first 0.5 ml GARDASIL (lot# 663453/0249Y). Concomitant vaccinations included DTAP-IPV (lot# C3249AA) and MENACTRA (lot# U3076AA). Concomitant therapy also included pain medications. On 27-JUL-2010, the patient was advised to see an OBGYN physician and was advised to see a Psychologist. On 27-JUL-2010, the patient had an abnormal pap smear. During the second week of August 2010, the patient called the physician's office and reported that on 30-JUL-2010 (three days after she had received the vaccinations) she had a miscarriage. The miscarriage was not confirmed by a physician. The patient stated that she had irregular periods and she was not sure that she had a miscarriage. The patient was advised to follow-up with her OBGYN physician. The M.A. did not know if the patient recovered. Upon internal review, miscarriage was determined to be an other important medical event. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Discomfort, Headache, Injection site haematoma, Medical device complication, Pain, Pyrexia

Symptom Text: Pt received third (and final) Gardasil vaccine at 16:00 on 08/27/2010 @ doctor's office. RN giving vaccine had to attempt administration twice - plunger in syringe jammed after needle inserted into pt's arm. Syringe removed from pt's arm, plunger unjammed and injection administered on second try. Pt woke at 07:30 on 08/28/2010 with headache, fever of 102.4 F, generalized aches throughout body, slight swelling and bruising at injection site. 200mg Ibuprofin administered at 08:00 which did not alleviate fever or discomfort. Add'l 200mg Ibuprofin administered @ 09:00. Fever lowered to 100.4 but headache and body aches were not alleviated. Pt put into cool bath at 13:45 and received 400mb Ibuprofin. Fever lowered to 99.4 after bath. Fever abated at 17:00 and headache and body aches are almost gone.

MedDRA PT Abdominal pain, Activities of daily living impaired, Asthenia, Headache, Hypoaesthesia, Injected limb mobility decreased, Injection site pain, Nausea, Sensory loss

Symptom Text: Information has been received from an agency concerning a 12 year old female patient who on 24-MAR-2010, was vaccinated with a dose of GARDASIL into her left arm and a dose of RECOMBIVAX HB (Lot # 666571/1597Y) into her right arm. The student left the clinic but returned within 15 minutes complaining of headache nausea, abdominal pain and a "dead arm". The patient was unable to fell of support her own arm when it was held out from her body. The patient was observed by the nurses and then was advised to see her general practitioner (GP) if the symptoms did not improve. On 24-MAR-2010, the doctor phones in to inform that the student had presented to see him with profound weakness, sensory loss and neuro-deficit in left arm. The patient was referred to a pediatrician. On 25-MAR-2010, the patient was seen by a neurologist for a nerve conduction test. On 29-MAR-2010 in phone contact with the patient's mother, she reported that the nerve conduction tests were normal. The patient was still not moving her left arm and needed assistance with everyday tasks. The patient was not attending school. ON 31-MAR-2010, a phone contact with the patient's mother indicated that the patient was referred to see a psychologist next week. The student attended school "yesterday", on 30-MAR-2010, but returned home at 11:30 AM because she was suffering from left shoulder pain from carrying around a "dead arm". The reporting agency considered that headache nausea, abdominal pain and a "dead arm", profound weakness, sensory loss and neuro-deficit in left arm were possibly related to therapy with GARDASIL. The reporting agency considered that headache nausea, abdominal pain and a "dead arm", profound weakness, sensory loss and neuro-deficit in left arm were other important medical events. Additional information is not expected.

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy, Haemorrhage

Symptom Text: Information has been received from a 26 year old female for GARDASIL a Pregnancy Registry product, who on 08-JUN-2010 was vaccinated with a first dose of GARDASIL (route and lot number unspecified). On 08-JUL-2010, the patient was vaccinated with a second dose of GARDASIL (route and lot number unspecified). The patient reported that on 06-JUL-2010, she found out she was pregnant. On 08-JUL-2010, the patient had a miscarriage. It was reported that since 11-AUG-2010, she had abnormal bleeding. The consumer stated that she had a period after her miscarriage but since GARDASIL was given it had caused her to have this abnormal bleeding. The patient also stated she had a miscarriage due to GARDASIL. The patient sought medical attention by visiting the hospital office. It was reported she would had an appointment with a physician on 17-AUG-2010. Additional information has been requested.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Abortion spontaneous, Drug exposure during pregnancy

Symptom Text: Information has been received from a nurse through the pregnancy registry for HPV vaccine concerning a 17 year old female with attention deficit/hyperactivity disorder who on 31-DEC-2008 was vaccinated with a dose of GARDASIL (lot # 660616/0570X), 0.5 ml, intramuscular route. Concomitant therapy included CONCERTA and RITALIN. On 07-JAN-2009, the patient called the office to inform office that she was pregnant. No adverse effects were reported. The patient's LMP and EDD were not reported. Follow-up information was received on 27-AUG-2010 from a medical assistance who reported that the patient had a miscarriage. According to the medical assistance, the doctor said the miscarriage happened early on her pregnancy but she could not provide a specific date. When asked if there was a pathology report she said there was no indication in chart that any testing was performed. She added that the patient was fine afterwards. Upon internal review miscarriage was considered to be an other important medical event. Additional information is not expected.

Other Meds: CONCERTA; RITALIN

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Aphonia, Laryngoscopy, Vocal cord disorder

Symptom Text: Information has been received and case reported by Health Authority (case n. 122094) (local case n. IT363/10). Initial report received on 17-Aug-2010. Case medically confirmed. A 15 year old female with no previous medical history was vaccinated on 25-Feb-2010 at 03:30 PM, with the first dose of GARDASIL (LOT# 1353X, batch # NL31800, site of administration not reported) via intramuscular route. On 26-FEB-2010 she experienced aphonia related to laryngoscopy for bilateral vocal cord hypotonia with oval shaped glottis without signs of inflammation and without increase in fever. Visit to ENT and phonetician. Anti-inflammatory treatment. Outcome was not reported. Upon internal review, aphonia was considered to be an other important medical event. Other business partner numbers included: E2010-04911. No further information is available. Case is closed.

Seriousness: NO CONDITIONS, NOT SERIOUS

MedDRA PT Fall, Head injury, Loss of consciousness, Syncope

Symptom Text: The child had a syncopal event within 5 minutes after being vaccinated; fell to floor and hit forehead on the floor. Child regained consciousness within 10 seconds. Staff laid the child on the couch. Child alert and oriented to person, place, and time immediately. Staff had child lie on couch for approximately 10 minutes and then sit at side of couch for approximately 5 more minutes. The family stated that he had not eaten and he was given juice and crackers. The mother decided to keep the child home from school to observe. Mother advised to call her physician if child started to feel increasingly worse, nauseous, dizzy, etc. Family left clinic approximately 20 minutes after incident with instructions to monitor child on walk to car.
